As to being apprehensive that such organisation will not deprive you of the State by one who makes himself a leader, I reply, that the arms carried by his citizens or subjects, given to them bylaws and ordinances, never do him harm, but rather are always of some usefulness, and preserve the City uncorrupted for a longer time by means of these (arms), than without (them). Rome remained free four hundred years while armed: Sparta eight hundred: Many other Cities have been disarmed, and have been free less than forty years; for Cities have need of arms, and if they do not have arms of their own. they hire them from foreigners, and the arms of foreigners more readily do harm to the public good than their own; for they are easier to corrupt, and a citizen who becomes powerful can more readily avail himself, and can also manage the people more readily as he has to oppress men who are disarmed. In addition to this, a City ought to fear two enemies more than one. One which avails itself of foreigners immediately has to fear not only its citizens, but the foreigners that it enlists; and, remembering what I told you a short while ago of Francesco Sforza, (you will see that) that fear ought to exist. One which employs its own arms, has not other fear except of its own Citizens. But of all the reasons which can be given, I want this one to serve me, that no one ever established any Republic or Kingdom who did not think that it should be defended by those who lived there with arms: and if the Venetians had been as wise in this as in their other institutions, they would have created a new world Kingdom: but who so much more merit censure, because they had been the first who were armed by their founders. And not having dominion on land, they armed themselves on the sea, where they waged war with virtu, and with arms in hand enlarged their country. But when the time came when they had to wage war on land to defend Venice and where they ought to have sent their own citizens to fight (on land), they enlisted as their captain (a foreigner), the Marquis of Mantua. This was the sinister course which prevented them from rising to the skies and expanding. And they did this in the belief that, as they knew how to wage war at sea, they should not trust themselves in waging it on land; which was an unwise belief (distrust), because a Sea captain, who is accustomed to combat with winds, water, and men, could more easily become a Captain on land where the combat is with men only, than a land Captain become a sea one. And my Romans, knowing how to combat on land and not on the sea, when the war broke out with the Carthaginians who were powerful on the sea, did not enlist Greeks or Spaniards experienced at sea, but imposed that change on those citizens they sent (to fight) on land, and they won. If they did this in order that one of their citizens should not become Tyrant, it was a fear that was given little consideration; for, in addition to the other reasons mentioned a short while ago concerning such a proposal, if a citizen (skilled) in (the use of) arms at sea had never been made a Tyrant in a City situated in the sea, so much less would he be able to do this if he were (skilled) in(the use of arms) on land And, because of this, they ought to have seen that arms in the hands of their own citizens could not create Tyrants, but the evil institutions of a Government are those which cause a City to be tyrannized; and, as they had a good Government, did not have to fear arms of their own citizens. They took an

imprudent course, therefore, which was the cause of their being deprived of much glory and happiness. As to the error which the King of France makes in not having his people disciplined to war, from what has been cited from examples previously mentioned, there is no one [devoid of some particular passion of theirs] who does not judge this defect to be in the Republic, and that this negligence alone is what makes it weak. But I have made too great a digression and have gotten away from my subject; yet I have done this to answer you and to show you, that no reliance can be had on arms other than ones own, and ones own arms can not be established otherwise than by way of an ordinance, nor can forms of armies be introduced in any place, nor military discipline instituted. If you have read the arrangements which the first Kings made in Rome, and most especially of Servius Tullus, you will find that the institution of classes is none other than an arrangement to be able quickly to put together an army for the defense of that City. But turning to our Deletto, I say again, that having to replenish an established (old) organisation, I would take the seventeen year olds, but having to create a new one. I would take them of every age between seventeen and forty in order to avail myself of them quickly

COSIMO: Would you make a difference of what profession(art) you would choose them from?

FABRIZIO: These writers do so, for they do not want that bird hunters, fishermen, cooks, procurers, and anyone who makes amusement his calling should be taken, but they want that, in addition to tillers of the soil, smiths and blacksmiths, carpenters, butchers, hunters, and such like, should be taken. But I would make little difference in conjecturing from his calling how good the man may be, but how much I can use him with the greatest usefulness. And for this reason, the peasants, who are accustomed to working the land, are more useful than anyone else, for of all the professions(arts), this one is used more than any other in the army: After this, are the forgers (smiths), carpenters, blacksmiths, shoemakers;of whom it is useful to have many, for their skills succeed in many things, as they are a very good thing for a soldier to have, from whom you draw double service.

COSIMO: How are those who are or are not suitable to fight chosen?

FABRIZIO: I want to talk of the manner of selecting a new organisation in order to make it after wards into an army; which yet also apply in the discussion of the selection that should be made in re-manning an old (established) organisation. I say, therefore, that how good the man is that you have to select as a soldier is recognised either from his experience, shown by some excellent deeds of his, or by conjecture. The proof of virtu cannot be found in men who are newly selected, and who never before have been selected; and of the former, few or none are found in an organisation which is newly established. It is necessary, therefore, lacking experience to have recourse to conjecture, which is derived from their age, profession, and physical appearance. The first two have been discussed: it remains to talk of the third. And yet I say that some have wanted that the soldier be big, among whom was Pyrrhus: Some others have chosen them only from the strength of the body, as Caesar did: which strength of body is conjectured from the composition of the members and the gracefulness of aspect. And yet some of those who write sav that he should have lively and merry eyes, a nervy neck, a large breast, muscular arms, long fingers, a small stomach, round hips, sleek legs and feet: which parts usually render a man strong and agile, which are the two things sought above everything else in a soldier. He ought, above all, to have regard for his habits and that there should be in him a (sense of) honesty and shame, otherwise there will be selected only an instrument of trouble and a beginning of corruption; for there is no one who believes that in a dishonest education and in a brutish mind, there can exist some virtu which in some part may be praiseworthy. Nor does it appear to me superfluous, rather I believe it necessary, in order for you to understand better the importance of this selection, to tell you the method that the Roman Consuls at the start of their Magistracy observed in selecting the Roman legions. In which Deletto, because those who had to be selected were to be a mixture of new and veteran men[because of the continuing wars], they proceeded from experience with regard to the old (veteran) men, and from conjecture with regard to the new. And this ought to be noted, that these Deletti are made, either for immediate training and use, or for future employment,

I have talked, and will talk, of those that are made for future employment, because my intention is to show you how an army can be organised in countries where there is no military (organisation), in which countries I cannot have Deletti in order to make use of them. But in countries where it is the custom to call out armies, and by means of the Prince, these (Deletti) exist, as was observed at Rome and is today observed among the Swiss. For in these Deletti, if they are for the (selection of) new men, there are so many others accustomed to being under military orders, that the old(veteran) and new, being mixed together, make a good and united body. Notwithstanding this, the Emperors, when they new men in charge over the soldiers, whom they called Tironi. as teachers to train them, as is seen in the life of the Emperor Maximus: which thing, while Rome was free, was instituted, not in the army, but within the City: and as the military exercises where the young men were trained were in the City, there resulted that those then chosen to go to war, being accustomed in the method of mock warfare, could easily adapt themselves to real war. But afterwards, when these Emperors discontinued these exercises, it was necessary to employ the methods I have described to you. Arriving, therefore, at the methods of the Roman Selection, I say that, as soon as the Roman Consuls, on whom was imposed the carrying on of the war, had assumed the Magistracy, in wanting to organise their armies [as it was the custom that each of them had two legions of Roman men, who were the nerve (center) of their armies], created twenty four military Tribunes, proposing six for each legion, who filled that office which today is done by those whom we call Constables. After they had assembled all the Roman men adept at carrying arms, and placed the Tribunes of each legion apart from each of the others. Afterwards, by lot they drew the Tribes, from which the first Selection was to be made, and of that Tribe they selected four of their best men, from whom one was selected by the Tribunes of the first legion, and of the other three, one was selected by the Tribunes of the second legion; of the other two, one was selected by the Tribunes of the third, and that last belonged to the fourth legion. After these four, four others were selected, of whom the first man was selected by the Tribunes of the second legion, the second by those of the third, the third by those of the fourth, the fourth remained to the first. After, another four were chosen: the first man was selected by the (Tribunes of the) third (legion), the second by the fourth, the third by the first, the fourth remained to the second. And thus this method of selection changed successively. so that the selection came to be equal, and the legions equalized. And as we said above, this was done where the men were to be used immediately: and as it was formed of men of whom a good part were experienced in real warfare, and everyone in mock battles, this Deletto was able to be based on conjecture and experience. But when a new army was to be organised and the selection made for future employment, this Deletto cannot be based except on conjecture, which is done by age and physical appearance.

began to hold fixed the (term of service of the) soldiers, placed

COSIMO: I believe what you have said is entirely true:but before you pass on to other discussion, I want to ask about one thing which you have made me remember, when you said that the Deletto which should be made where these men are not a ccustomed to fighting should be done by conjecture: for I have heard our organisation censured in many of its parts, and especially as to number; for many say that a lesser number ought to be taken, of whom those that are drawn would be better and the selection better, as there would not be as much hardship imposed on the men, and some reward given them, by means of which they would be more content and could be better commanded. Whence I would like to know your opinion on this part, and if you preferred a greater rather than a smaller number, and what methods you would use in selecting both numbers.

FABRIZIO: Without doubt the greater number is more desirable and more necessary than the smaller: rather, to say better, where a great number are not available. a perfect organisation cannot be made, and I will easily refute all the reasons cited in favor of this. I say, therefore, first, that where there are many people, as there are for example in Tusc any, does not cause you to have better ones, or that the Deletto is more selective; for desiring in the selection of men to judge them on the basis of experience, only a very few would probably be found in that country who would have had this experience, as much because few have been in a war, as because of those few who have been, very few have ever been put to the test, so that because of this they merit to be chosen before the others: so that whoever is in a similar situation should select them, must leave experience to one side and take them by conjecture: and if I were brought to such a necessity, I would want to see, if twenty young men of good physical appearance should come before me, with what rule rule I ought to take some or reject some: so that without doubt I believe that every man will confess that it is a much smaller error to take them all in arming and training them, being unable to know (beforehand) which of them are better, and to reserve to oneself afterwards to make a more certain Deletto where. during the exercises with the army, those of greater courage and vitality may be observed. So that, considering everything, the selection in this case of a few in order to have them better, is entirely false. As to causing less hardship to the country and to the men, I say that the ordinance, whether it is bad or insufficient, does not cause any hardship; for this order does not take men away from their business, and does not bind them so that they cannot go to carry out their business, because it only obliges them to come together for training on their free days, which proposition does not do any harm either to the country or the men; rather, to the young, it ought to be delightful, for where, on holidays they remain basely indolent in their hangouts, they would now attend these exercises with pleasure, for the drawing of arms, as it is a beautiful spectacle, is thus delightful to the young men. As to being able to pay (more to) the lesser number, and thereby keeping them more content and obedient, I reply, that no organisation of so few can be made, who are paid so continually, that their pay satisfies them. For instance, if an army of five thousand infantry should be organised, in wanting to pay them so that it should be believed they would be contented, they must be given at least ten thousand ducats a month. To begin with, this number of infantry is not enough to make an army, and the payment is unendurable to a State; and on the other hand, it is not sufficient to keep the men content and obligated to respect your position. So that in doing this although much would be spent, it would provide little strength, and would not be sufficient to defend you, or enable you to undertake any enterprise. If you should give them more, or take on more, so much more impossible would it be for you to pay them: if you should give them less, or take on fewer, so much less would be content and so much less useful would they be to you. Therefore, those who consider things which are either useless or impossible. But it is indeed necessary to pay them when they are levied to send to war.

But even if such an arrangement should give some hardship to those enrolled in it in times of peace, which I do not see, they are still recompensed by all those benefits which an army established in a City bring; for without them, nothing is secure. I conclude that whoever desires a small number in order to be able to pay them, or for any other reason cited by you, does not know (what he is doing); for it will also happen, in my opinion, that any number will always diminish in your hands, because of the infinite impediments that men have; so that the small number will succeed at nothing. However, when you have a large organisation, you can at your election avail yourself of few or of many. In addition to this, it serves you in fact and reputation, for the large number will always give you reputation. Moreover, in creating the organisation, in order to keep men trained, if you enroll a small number of men in many countries, and the armies are very distant from each other, you cannot without the gravest injury to them assemble them for (joint) exercises, and without this training the organisation is useless, as will be shown in its proper place

COSIMO: What you have said is enough on my question:but I now desire that you resolve another doubt for me. There are those who say that such a multitude of armed men would cause confusion, trouble, and disorder in the country. FABRIZIO: This is another vain opinion for the reason I

will tell you. These organised under arms can cause disorders in two ways: either among themselves, or against others; both of these can be obviated where discipline by itself should not do so: for as to troubles among themselves, the organisation removes them, not brings them up, because in the organisation you give them arms and leaders. If the country where you organise them is so unwar like that there are not arms among its men, and so united that there are no leaders. such an organisation will make them more ferocious against the foreigner, but in no way will make it more disunited, because men well organised, whether armed or unarmed, fear the laws, and can never change, unless the leaders you give them cause a change; and I will later tell you the manner of doing this. But if the country where you have organised an army is warlike and disunited, this organisation alone is reason enough to unite them, for these men have arms and leaders for themselves: but the arms are useless for war, and the leaders causes of troubles; but this organisation gives them arms useful for war, and leaders who will extinguish troubles: for as soon as some one is injured in that country, he has recourse to his(leader) of the party, who, to maintain his reputation, advises him to avenge himself, (and) not to remain in peace. The public leader does the contrary. So that by this means, the causes for trouble are removed, and replaced by those for union; and provinces which are united but effeminate (unwarlike) lose their usefulness but maintain the union, while those that are disunited and troublesome remain united; and that disordinate ferocity which they usually employ, is turned to public usefulness.

As to desiring that they do us injury against others, it should be kept in mind that they cannot do this except by the leaders who govern them. In desiring that the leaders do not cause disorders, it is necessary to have care that they do not acquire too much authority over them. And you have to keep in mind that this authority is acquired either naturally or by accident: And as to nature, it must be provided that whoever is born in one place is not put in charge of men enrolled in another place, but is made a leader in those places where he does not have any natural connections. As to accidents, the organisation should be such that each year the leaders are exchanged from command to command; for continuous authority over the same men generates so much unity among them, which can easily be converted into prejudice against the Prince. As to these exchanges being useful to those who have employed them, and injurious to those who have not observed them, is known from the example of the Kingdom of Assyria and from the Empire of the Romans, in which it is seen that the former Kingdom endured a thousand years without tumult and without civil war; which did not result from anything else than the exchanges of those Captains, who were placed in charge of the care of the armies, from place to place every year. Nor, for other reasons, (did it result) in the Roman Empire; once the blood (race) of Caesar was extinguished, so many civil wars arose among the Captains of the armies, and so many conspiracies of the above mentioned Captains against the Emperors, resulting from the continuing of those Captains in their same Commands. And if any of those Emperors, and any who later held the Empire by reputation, such as Hadrian, Marcus, Severus, and others like them, would have observed such happenings, and would have introduced this custom of exchanging Captains in that Empire. without doubt they would have made it more tranquil and lasting; for the Captains would have had fewer opportunities for creating tumults, and the Emperors fewer causes to fear them, and the Senate, when there was a lack in the succession, would have had more authority in the election of Emperors, and consequently, better conditions would have resulted. But the bad customs of men, whether from ignorance or little diligence, or from examples of good or bad, are never put aside.

COSIMO: I do not know if, with my question, I have gone outside the limits you set; for from the Deletto we have entered into another discussion, and if I should not be excused a little, I shall believe I merit some reproach.

FABRIZIO: This did us no harm; for all this discussion was necessary in wanting to discuss the Organisation (of an Army), which, being censured by many, it was necessary to explain it, if it is desired that this should take place before the Deletto. And before I discuss the other parts, I want to discuss the Deletto for men on horseback. This (selection) was done by the ancients from among the more wealthy, having regard both for the age and quality of the men, selecting three hundred for each legion: so that the Roman cavalry in every Consular army did not exceed six hundred.

COSIMO: Did you organise the cavalry in order to train them at home and avail yourself of them in the future?

FABRIZIO: Actually it is a necessity and cannot be done otherwise, if you want to have them take up arms for you, and not to want to take them away from those who make a profession of them.

COSIMO: How would you select them?

FABRIZIO: I would imitate the Romans: I would take the more wealthy, and give them leaders in the same manner as they are given to others today, and I would arm them, and train them.

COSIMO: Would it be well to give these men some provision?

FABRIZIO: Yes, indeed: but only as much as is necessary to take care of the horse; for, as it brings an expense to your subjects, they could complain of you. It would be necessary, therefore, to pay them for the horse and its upkeep.

COSIMO: How many would you make? How would you arm them?

FABRIZIO: You pass into another discussion. I will tell you in its place, which will be when I have said how the infantry ought to be armed, and how they should prepare for an engagement.

MACHIAVELLI ART OF WAR, 2ND BOOK

I believe that it is necessary, once the men are found, to arm them; and in wanting to do this, I believe it is necessary to examine what arms the ancients used, and from them select the best. The Romans divided their infantry into the heavily and lightly armed. The light armed they gave the name Veliti. Under this name they included all those who operated with the sling, cross-bow, and darts: and the greater part of them carried a helmet (head covering) and a shield on the arm for their defense. These men fought outside the regular ranks, and apart from the heavy armour, which was a Casque that came up to the shoulders, they also carried a Cuirass which, with the skirt, came down to the knees, and their arms and legs were covered by shin-guards and bracelets: they also carried a shield on the arm, two arms in length and one in width, which had an iron hoop on it to be able to sustain a blow, and another underneath, so that in rubbing on the ground, it should not be worn out. For attacking, they had cinched on their left side a sword of an arm and a half length, and a dagger on the right side. They carried a spear, which they called Pilus, and which they hurled at the enemy at the start of a battle. These were the important Roman arms, with which they conquered the world. And although some of the ancient writers also gave them, in addition to the aforementioned arms, a shaft in the hand in the manner of a spit, I do not know how a staff can be used by one who holds a shield, for in managing it with two hands it is impeded by the shield and he cannot do anything worthwhile with one hand because of its heaviness. In addition to this, to combat in the ranks with the staff (as arms) is useless, except in the front rank where there is ample space to deploy the entire staff, which cannot be done in the inner ranks, because the nature of the battalions

Copyright © 2018 by Lord Henfield, Guildford Scientific Press PAGE 3378 [as I will tell you in their organisation] is to press its ranks continually closer together, as this is feared less, even though inconvenient, than for the ranks to spread further apart, where the danger is most apparent. So that all the arms which exceed two arms in length are useless in tight places; for if you have a staff and want to use it with both hands, and handled so that the shield should not annoy you, you cannot attack an enemy with it who is next to you. If you take it in one hand in order to serve yourself of the shield, you cannot pick it up except in the middle, and there remains so much of the staff in the back part, that those who are behind impede you in using it. And that this is true, that the Romans did not have the staff, or, having it, they valued it little, you will read in all the engagements noted by Titus Livius in his history, where you will see that only very rarely is mention made of the shaft. rather he always says that, after hurling the spears, they put their hands on the sword. Therefore I want to leave this staff, and relate how much the Romans used the sword for offense, and for defense, the shield together with the other arms mentioned above

The Greeks did not arm so heavily for defense as did the Romans, but in the offense relied more on this staff than on the sword, and especially the Phalanxes of Macedonia, who carried staffs which they called Sarisse, a good ten arms in length, with which they opened the ranks of the enemy and maintained order in the Phalanxes. And although other writers say they also had a shield, I do not know [for the reasons given abovel how the Sarisse and the shield could exist together. In addition to this, in the engagement that Paulus Emilius had with Perseus, King of Macedonia, I do not remember mention being made of shields, but only of the Sarisse and the difficulty the Romans had in overcoming them. So that I conjecture that a Macedonian Phalanx was nothing else than a battalion of Swiss is today, who have all their strength and power in their pikes. The Romans [in addition to the armslornamented the infantry with plumes: which things make the sight of an army beautiful to friends, and terrible to the enemy. The arms for men on horseback in the original ancient Roman (army) was a round shield, and they had the head covered, but the rest (of the body) without armour. They had a sword and a staff with an iron point, long and thin; whence they were unable to hold the shield firm, and only make weak movements with the staff, and because they had no armour, they were exposed to wounds. Afterwards, with time, they were armed like the infantry, but the shield was much smaller and square, and the staff more solid and with two iron tips, so that if the one side was encumbered, they could avail themselves of the other. With these arms, both for the infantry and the cavalry, my Romans occupied all the world, and it must be believed, from the fruits that are observed, that they were the best armed armies that ever existed.

And Titus Livius, in his histories, gives many proofs, where, in coming to the comparison with enemy armies, he says, "but the Romans were superior in virtu, kinds of arms, and discipline" And therefore I have discussed more in particular the arms of the victors than those of the losers. It appears proper to me to discuss only the present methods of arming. The infantry have for their defense a breast plate of iron, and for offense a lance nine armlengths long, which they call a pike, and a sword at their side, rather round in the point than sharp. This is the ordinary armament of the infantry today, for few have their arms and shins(protected by) armour, no one the head; and those few carry a halberd in place of a pike, the shaft of which [as you know] is three armlengths long, and has the iron attached as an axe. Among them they have three Scoppettieri (Exploders, i.e., Gunners), who, with a burst of fire fill that office which anciently was done by slingers and bow-men. This method of arming was established by the Germans, and especially by the Swiss, who, being poor and wanting to live in freedom, were, and are, obliged to combat with the ambitions of the Princes of Germany, who were rich and could raise horses, which that people could not do because of poverty:whence it happened that being on foot and wanting to defend themselves from enemies who were on horseback, it behooved them to search the ancient orders and find arms which should defend them from the fury of horses. This necessity has caused them to maintain or rediscover the ancient orders, without which, as every prudent man affirms, the infantry is entirely useless. They therefore take up pikes as arms, which are most useful not only in sustaining (the attacks of) horses, but to overcome them. And because of the virtu of these arms and ancient orders, the Germans have assumed so much audacity, that fifteen or twenty thousand of them would assault any great number of horse, and there have been many examples of this seen in the last twenty five years. And this example of their virtu founded on these arms and these orders have been so powerful, that after King Charles passed into Italy, every nation has imitated them: so that the Spanish armies have come into a very great reputation.

COSIMO: What method of arms do you praise more, this German one or the ancient Roman?

FABRIZIO: The Roman without any doubt, and I will tell you the good and the bad of one and the other. The German

infantry can sustain and overcome the cavalry. They are more expeditious in marching and in organising themselves, because they are not burdened with arms. On the other hand, they are exposed to blows from near and far because of being unarmed. They are useless inland battles and in every fight where there is stalwart resistance. But the Romans sustained and overcame the cavalry, as these (Germans) do. They were safe from blows near and far because they were covered with armour. They were better able to attack and sustain attacks having the shields. They could more actively in tight places avail themselves of the sword than these (Germans) with the pike; and even if the latter had the sword, being without a shield, they become, in such a case, (equally) useless. They (the Romans) could safely assault towns, having the body covered, and being able to cover it even better with the shield. So that they had no other inconvenience than the heaviness of the arms (armour) and the annoyance of having to carry them; which inconveniences they overcame by accustoming the body to hardships and inducing it to endure hard work. And you know we do not suffer from things to which we are accustomed. And you must understand this, that the infantry must be able to fight with infantry and cavalry, and those are always useless who cannot sustain the (attacks of the) cavalry, or if they are able to sustain them, none the less have fear of infantry who are better armed and organised than they. Now if you will consider the German and the Roman infantry, you will find in the German [as we have said] the aptitude of overcoming cavalry, but great disadvantages when fighting with an infantry organised as they are, and armed as the Roman. So that there will be this advantage of the one over the other, that the Romans could overcome both the infantry and the cavalry, and the Germans only the cavalry.

COSIMO: I would desire that you give some more particular example, so that we might understand it better.

FABRIZIO: I say thusly, that in many places in our histories you will find the Roman infantry to have defeated numberless cavalry, but you will never find them to have been defeated by men on foot because of some defect they may have had in their arms or because of some advantage the enemy had in his. For if their manner of arming had been defective, it was necessary for them to follow one of two courses: either when they found one who was better armed than they, not to go on further with the conquest, or that they take up the manner of the foreigner, and leave off theirs:and since neither ensued, there follows, what can be easily conjectured, that this method of arming was better than that of anyone else. This has not yet occurred with the German infantry; for it has been seen that anytime they have had to comhat with men on foot organised and as obstinate as they, they have made a bad showing; which results from the disadvantage they have in trying themselves against the arms of the enemy. When Filippo Visconti, Duke of Milan, was assaulted by eighteen thousand Swiss, he sent against them Count Carmingnuola, who was his Captain at that time. This man with six thousand cavalry and a few infantry went to encounter them, and, coming hand to hand with them, was repulsed with very great damage. Whence Carmingnuola as a prudent man quickly recognised the power of the enemy arms, and how much they prevailed against cavalry, and the weakness of cavalry against those on foot so organised; and regrouping his forces, again went to meet the Swiss, and as they came near he made his men-at-arms descend from their horses, and in that manner fought with them, and killed all but three thousand, who, seeing themselves consumed without having any remedy, threw their arms on the ground and surrendered

COSIMO: Whence arises such a disadvantage?

FABRIZIO: I have told you a little while ago, but since you have not understood it, I will repeat it to you. The German infantry [as was said a little while ago] has almost no armour in defending itself, and use pikes and swords for offense. They come with these arms and order of battle to meet the enemy, who [if he is well equipped with armour to defend himself, as were the men-at-arms of Carmingnuola who made them descend to their feet] comes with his sword and order of battle to meet him, and he has no other difficulty than to come near the Swiss until he makes contact with them with the sword: for as soon as he makes contact with them, he combats them safely, for the German cannot use the pike against the enemy who is next to him because of the length of the staff, so he must use the sword, which is useless to him, as he has no armour and has to meet an enemy that is (protected) fully by armour. Whence, whoever considers the advantages and disadvantages of one and the other, will see that the one without armour has no remedy, but the one well armoured will have no difficulty in overcoming the first blow and the first passes of the pike: for in battles, as you will understand better when I have demonstrated how they are put together, the men go so that of necessity they accost each other in a way that they are attacked on the breast, and if one is killed or thrown to the ground by the pike, those on foot who remain are so numerous that they are sufficient for victory. From this there resulted that Carmingnuola won with such a massacre of the Swiss, and with little loss to himself.

COSIMO: I see that those with Carmingnuola were men-atarms, who, although they were on foot, were all covered with iron (armour), and, therefore, could make the attempt that they made; so that I think it would be necessary to arm the infantry in the same way if they want to make a similar attempt.

FABRIZIO: If you had remembered how I said the Romans were armed, you would not think this way. For an infantryman who has his head covered with iron, his breast protected by a cuirass and a shield, his arms and legs with armour, is much more apt to defend himself from pikes, and enter among them, than is a man-at-arms (cavalryman) on foot. I want to give you a small modem example. The Spanish infantry had descended from Sicily into the Kingdom of Naples in order to go and meet Consalvo who was besieged in Barletta by the French. They came to an encounter against Monsignor D'Obigni with his men-at-arms, and with about four thousand German infantry. The Germans, coming hand to hand with their pikes low, penetrated the (ranks of the) Spanish infantry; but the latter, aided by their spurs and the agility of their bodies, intermingled themselves with the Germans, so that they (the Germans) could not get near them with their swords; whence resulted the death of almost all of them, and the victory of the Spaniards. Everyone knows how many German infantry were killed in the engagement at Ravenna, which resulted from the same causes, for the Spanish infantry got as close as the reach of their swords to the German infantry, and would have destroyed all of them. if the German infantry had not been succored by the French Cavalry: none the less, the Spaniards pressing together made themselves secure in that place. I conclude, therefore, that a good infantry not only is able to sustain the (attack) of cavalry, but does not have fear of infantry, which [as I have said many times] proceeds from its arms (armour) and organisation (discipline).

COSIMO: Tell us, therefore, how you would arm them.

FABRIZIO: I would take both the Roman arms and the German, and would want half to be armed as the Romans, and the other half as the Germans. For, if in six thousand infantry [as I shall explain a little later] I should have three thousand infantry with shields like the Romans, and two thousand pikes and a thousand gunners like the Germans, they would be enough for me; for I would place the pikes either in the front lines of the battle, or where I should fear the cavalry most; and of those with the shield and the sword, I would serve myself to back up the pikes and to win the engagement, as I will show you. So that I believe that an infantry so organised should surpass any other infantry today. COSIMO: What you have said to us is enough as recards

COSIMO: What you have said to us is enough as regards infantry, but as to cavalry, we desire to learn which seems the more strongly armed to you, ours or that of the ancients?

FABRIZIO: I believe in these times, with respect to saddles and stirrups not used by the ancients, one stays more securely on the horse than at that time. I believe we arm more securely: so that today one squadron of very heavily (armed) men-atarms comes to be sustained with much more difficulty than was the ancient cavalry. With all of this, I judge, none the less, that no more account ought to be taken of the cavalry than was taken anciently; for [as has been said above] they have often in our times been subjected to disgrace by the infantry armed (armoured) and organised as (described) above. Tigranus, King of Armenia, came against the Roman army of which Lucullus was Captain, with (an army) of one hundred fifty thousand cavalry, among whom were many armed as our men-at-arms, whom they called Catafratti, while on the other side the Romans did not total more than six thousand (cavalry)and fifteen thousand infantry; so that Tigranus, when he saw the army of the enemy, said: "These are just about enough horsemen for an embassy". None the less, when they came to battle, he was routed; and he who writes of that battle blames those Catafratti, showing them to be useless, because, he says, that having their faces covered, their vision was impaired and they were little adept at seeing and attacking the enemy, and as they were heavily burdened by the armour, they could not regain their feet when they fell, nor in any way make use of their persons. I say, therefore, that those People or Kingdoms which esteem the cavalry more than the infantry, are always weaker and more exposed to complete ruin, as has been observed in Italy in our times, which has been plundered, ruined, and overrun by foreigners, not for any other fault than because they had paid little attention to the foot soldiers and had mounted all their soldiers on horses. Cavalry ought to be used, but as a second and not the first reliance of an army; for they are necessary and most useful in undertaking reconnaissance, in overrunning and despoiling the enemy country, and to keep harassing and troubling the enemy army so as to keep it continually under arms, and to impede its provisions; but as to engagements and battles in the field, which are the important things in war and the object for which armies are organised, they are more useful in pursuing than in routing the enemy, and are much more inferior to the foot soldier in accomplishing the things necessary in accomplishing such (defeats).

COSIMO: But two doubts occur to me: the one, that I know that the Parthians did not engage in war except with cavalry, yet they divided the world with the Romans: the other, that I would like you to tell me how the (attack of) the cavalry can be sustained by the infantry, and whence arises the virtu of the latter and the weakness of the former?

FABRIZIO: Either I have told you, or I meant to tell you, that my discussion on matters of war is not going beyond the limits of Europe. Since this is so, I am not obliged to give reasons for that which is the custom in Asia. Yet, I have this to say, that the army of Parthia was completely opposite to that of the Romans, as the Parthians fought entirely on horseback, and in the fighting was about confused and disrupted, and was a way of fighting unstable and full of uncertainties. The Romans, it may be recalled, were almost all on foot, and fought pressed closely together, and at various times one won over the other, according as the site (of the battle) was open or tight; for in the latter the Romans were superior, but in the former the Parthians, who were able to make a great trial with that army with respect to the region they had to defend, which was very open with a seacoast a thousand miles distant, rivers two or three days (journey) apart from each other, towns likewise, and inhabitants rare: so that a Roman army, heavy and slow because of its arms and organisation, could not pursue him without suffering great harm, because those who defended the country were on horses and very speedy, so that he would be in one place today, and tomorrow fifty miles distant. Because of this. the Parthians were able to prevail with cavalry alone, and thus resulted the ruin of the army of Crassus, and the dangers to those of Marcantonio. But [as I have said] I did not intend in this discussion of mine to speak of armies outside of Europe; and, therefore, I want to continue on those which the Romans and Greeks had organised in their time, and that the Germans do today

But let us come to the other question of yours, in which you desire to know what organisation or what natural virtu causes the infantry to be superior to the cavalry. And I tell you, first, that the horses cannot go in all the places that the infantry do, because it is necessary for them either to turn back after they have come forward, or turning back to go forward, or to move from a stand-still, or to stand still after moving, so that, without doubt, the cavalry cannot do precisely thus as the infantry. Horses cannot, after being put into disorder from some attack, return to the order (of the ranks) except with difficulty, and even if the attack does not occur; the infantry rarely do this. In addition to this, it often occurs that a courageous man is mounted on abase horse and a base man on a courageous horse, whence it must happen that this difference in courage causes disorders. Nor should anyone wonder that a Knot (group) of infantry sustains every attack of the cavalry, for the horse is a sensible animal and knows the dangers, and goes in unwillingly. And if you would think about what forces make him (the horse) go forward and what keep him back, without doubt you will see that those which hold him back are greater than those which push him; for spurs make him go forward, and, on the other hand, the sword and the pike retain him. So that from both ancient and modem experiences, it has been seen that a small group of infantry can be very secure from, and even actually insuperable to, the cavalry. And if you should argue on this that the Elan with which he comes makes it more furious in hurling himself against whoever wants to sustain his attack, and he responds less to the pike than the spur, I say that, as soon as the horse so disposed begins to see himself at the point of being struck by the points of the pikes, either he will by himself check his gait, so that he will stop as soon as he sees himself about to be pricked by them, or, being pricked by them, he will turn to the right or left. If you want to make a test of this, try to run a horse against a wall, and rarely will you find one that will run into it, no matter with what Elan you attempt it. Caesar, when he had to combat the Swiss in Gaul, dismounted and made everyone dismount to their feet, and had the horses removed from the ranks, as they were more adept at fleeing than fighting.

But, notwithstanding these natural impediments that horse shave, the Captain who leads the infantry ought to select roads that have as many obstacles for horses as possible, and rarely will it happen that the men will not be able to provide for their safety from the kind of country. If one marches among hills, the location of the march should be such that you may be free from those attacks of which you may be apprehensive; and if you goon the plains, rarely will you find one that does not have crops or woods which will provide some safety for you, for every bush and embankment, even though small, breaks up that dash, and every cultivated area where there are vines and other trees impedes the horses. And if you come to an engagement, the same will happen to you as when marching, because every little impediment which the horse meets cause him to lose his fury. None the less, I do not want to forget to tell you one thing, that although the Romans esteemed much their own discipline and trusted very much on their arms (and armour), that if they had to select a place, either so rough to protect themselves from horses and where they could not be able to deploy their forces, or one where they had more to fear from the horses but where they were able to spread out, they would always take the latter and leave the former.

But, as it is time to pass on to the training (of the men), having armed this infantry according to the ancient and modem usage, we shall see what training they gave to the Romans before the infantry were led to battle. Although they were well selected and better armed, they were trained with the greatest attention, because without this training a soldier was never any good. This training consisted of three parts. The first, to harden the body and accustom it to endure hardships, to act faster, and more dexterously. Next, to teach the use of arms: The third, to teach the trainees the observance of orders in marching as well as fighting and encamping. These are the three principal actions which make an army: for if any army marches, encamps, and fights, in a regular and practical manner, the Captain retains his honour even though the engagement should not have a good ending. All the ancient Republics, therefore, provided such training, and both by custom and law, no part was left out. They therefore trained their youth so as to make them speedy in running. dextrous in jumping, strong in driving stakes and wrestling. And these three qualities are almost necessary in a soldier; for speed makes him adept at occupying places before the enemy, to come upon him unexpectedly, and to pursue him when he is routed. Dexterity makes him adept at avoiding blows, jumping a ditch and climbing over an embankment. Strength makes him better to carry arms, hurl himself against an enemy, and sustain an attack. And above all, to make the body more inured to hardships, they accustom it to carry great weights. This accustoming is necessary, for in difficult expeditions it often happens that the soldier, in addition to his arms, must carry provisions for many days, and if he had not been accustomed to this hard work, he would not be able to do it. and, hence, he could neither flee from a danger nor acquire a victory with fame.

As to the teaching of the use of arms, they were trained in this way. They had the young men put on arms (armour) which weighed more than twice that of the real (regular) ones. and, as a sword, they gave them a leaded club which in comparison was very heavy. They made each one of them drive a pole into the ground so that three arm-lengths remained (above ground), and so firmly fixed that blows would not drive it to one side or have it fall to the ground; against this pole, the young men were trained with the shield and the club as against an enemy, and sometime they went against it as if they wanted to wound the head or the face another time as if they wanted to puncture the flank, sometimes the legs, sometime they drew back, another time they went forward. And in this training, they had in mind making themselves adept at covering(protecting) themselves and wounding the enemy; and since the feigned arms were very heavy, the real ones afterwards seemed light. The Romans wanted their soldiers to wound (the enemy) by the driving of a point against him, rather than by cutting (slashing), as much because such a blow was more fatal and had less defense against it, as also because it left less uncovered (unprotected)those who were wounding, making him more adept at repeating his attack, than by slashing. Do you not wonder that those ancients should think of these minute details, for they reasoned that where men had to come hand to hand (in battle), every little advantage is of the greatest importance; and I will remind you of that, because the writers say of this that I have taught it to you. Nor did the ancients esteem it a more fortunate thing in a Republic than to have many of its men trained in arms; for it is not the splendor of jewels and gold that makes the enemy submit themselves to you, but only the fear of arms. Moreover, errors made in other things can sometimes be corrected afterwards, but those that are made in war, as the punishment happens immediately, cannot be corrected. In addition to this, knowing how to fight makes men more audacious, as no one fears to do the things which appear to him he has been taught to do. The ancients, therefore, wanted their citizens to train in every warlike activity: and even had them throw darts against the pole heavier than the actual ones:which exercise, in addition to making men expert in throwing, also makes the arm more limber and stronger. They also taught them how to draw the bow and the sling, and placed teachers in charge of doing all these things: so that when (men) were selected to go to war, they were already soldiers in spirit and disposition. Nor did these remain to teach them anything else than to go by the orders and maintain themselves in them whether marching or combatting: which they easily taught by mixing themselves with them, so that by knowing how to keep (obey) the orders, they could exist longer in the army.

COSIMO: Would you have them train this way now?

FABRIZIO: Many of those which have been mentioned, like running wrestling, making them jump, making them work hard under arms heavier than the ordinary, making them draw the crossbow and the sling; to which I would add the light gun, a new instrument [as you know], and a necessary one. And I would accustom all the youth of my State to this training: but that part of them whom I have enrolled to fight, I would (especially) train with greater industry and more solicitude, and I would train them always on their free days. I would also desire that they be taught to swim, which is a very useful thing, because there are not always bridges at rivers, nor ships ready: so that if your army does not know how to swim, it may be deprived of many advantages, and many opportunities, to act well are taken away. The Romans, therefore, arranged that the young men be trained on the field of Mars, so that having the river Tiber nearby, they would be able after working hard in exercises on land to refresh themselves in the water, and also exercise them in their swimming.

I would also do as the ancients and train those who fight on horseback: which is very necessary, for in addition to knowing how to ride, they would know how to avail themselves of the horse(in maneuvering him). And, therefore, they arranged horses of wood on which they straddled, and jumped over them armed and unarmed without any help and without using their hands: which made possible that in a moment, and at a sign from the Captain, the cavalry to become as foot soldiers, and also at another sign, for them to be remounted. And as such exercises, both on foot and horseback, were easy at that time, so now it should not be difficult for that Republic or that Prince to put them in practice on their youth, as is seen from the experience of Western Cities, where these methods similar to these institutions are yet kept alive.

They divide all their inhabitants into several parts, and assign one kind of arms of those they use in war to each part. And as they used pikes, halberds, bows, and light guns, they called them pikemen, halberdiers, archers, and gunners. It therefore behooved all the inhabitants to declare in what order they wanted to be enrolled. And as all, whether because of age or other impediment, are not fit for war (combat), they make a selection from each order and they call them the Giurati (Sworn Ones), who, on their free days, are obliged to exercise themselves in those arms in which they are enrolled: and each one is assigned his place by the public where such exercises are to be carried on, and those who are of that order but are not sworn, participate by (contributing)money for those expenses which are necessary for such exercises. That which they do, therefore, we can do, but our little prudence does not allow us to take up any good proceeding.

From these exercises, it resulted that the ancients had good infantry, and that now those of the West have better infantry than ours, for the ancients exercised either at home as did those Republics, or in the armies as did those Emperors, for the reasons mentioned above. But we do not want to exercise at home, and we cannot do so in the field because they are not our subjects and we cannot obligate them to other exercises than they themselves want. This reason has caused the armies to die out first, and then the institutions, so that the Kingdoms and the Republics, especially the Italian, exist in such a weak condition today.

But let us return to our subject, and pursuing this matter of training, I say, that it is not enough in undertaking good training to have hardened the men, made them strong, fast and dextrous, but it is also necessary to teach them to keep discipline, obey the signs, the sounds (of the bugle), and the voice of the Captain; to know when to stand, to retire, to go forward, and when to combat, to march, to maintain ranks: for without this discipline, despite every careful diligence observed and practiced, an army is never good. And without doubt, bold but undisciplined men are more weak than the timid but disciplined ones; for discipline drives away fear from men, lack of discipline makes the bold act foolishly. And so that you may better understand what will be mentioned below, you have to know that every nation has made its men train in the discipline of war, or rather its army as the principal part, which, if they have varied in name, they have varied little in the numbers of men involved, as all have comprised six to eight thousand men. This number was called a Legion by the Romans, a Phalanx by the Greeks, a Caterna by the Gauls. This same number, by the Swiss, who alone retain any of that ancient military umbrage, in our times is called in their language what in ours signifies a Battalion. It is true that each one is further subdivided into small Battaglia (Companies), and organised according to its purpose. It appears to me, therefore, more suitable to base our talk on this more notable name, and then according to the ancient and modern systems, arrange them as best as is possible. And as the Roman Legions were composed of five or six thousand men, in ten Cohorts, I want to divide our Battalion into ten Companies, and compose it of six thousand men on foot; and assign four hundred fifty men to each Company, of whom four hundred are heavily armed and fifty lightly armed: the heavily armed include three hundred with shields and swords, and will be called Scudati (shield bearers), and a hundred with pikes and will be called pikemen: the lightly armed are fifty infantry armed with light guns, cross-bows, halberds, and bucklers, and these, from an ancient name, are called regular(ordinary) Veliti: the whole ten Companies, therefore, come to three thousand shield bearers; a thousand ordinary pikemen, and one hundred fifty ordinary Veliti, all of whom

comprise (a number of) four thousand five hundred infantry. And we said we wanted to make a Battalion of six thousand men: therefore it is necessary to add another one thousand five hundred infantry, of whom I would make a thousand with pikes, whom I will call extraordinary pikemen, (and five hundred light armed, whom I will call extraordinary Veliti): and thus my infantry would come [according as was said a little while ago] to be composed half of shield bearers and half among pikemen and other arms (carriers). In every Company, I would put in charge a Constable, four Centurions, and forty Heads of Ten, and in addition, a Head of the ordinary Veliti with five Heads of Ten. To the thousand extraordinary pikemen, I would assign three Constables, ten Centurions, and a hundred Heads ofTen: to the extraordinary Veliti, two Constables, five Centurions, and fifty Heads of Ten. I would also assign a general Head for the whole Battalion. I would want each Constable to have a distinct flag and (bugle) sound.

Summarizing, therefore, a Battalion would be composed of ten Companies, of three thousand shield bearers, a thousand ordinary pikemen, a thousand extraordinary pikemen, five hundred ordinary Veliti, and five hundred extraordinary Veliti: thus they would come to be six thousand infantry, among whom there would be one thousand five hundred Heads of Ten, and in addition fifteen Constables, with fifteen Buglers and fifteen flags, fifty five Centurions, ten Captains of ordinary Veliti, and one Captain for the whole Battalion with its flag and Bugler. And I have knowingly repeated this arrangement many times, so that then, when I show you the methods for organising the Companies and the armies, you will not be confounded.

I say, therefore, that any King or Republic which would want to organise its subjects in arms, would provide them with these parties and these arms, and create as many battalions in the country as it is capable of doing: and if it had organised it according to the division mentioned above, and wanting to train it according to the orders, they need only to be trained Company by Company. And although the number of men in each of them could not be themselves provide a reasonably (sized) army, none the less, each man can learn to do what applies to him in particular, for two orders are observed in the armies: the one, what men ought to do in each Company: the other, what the Company ought to do afterwards when it is with others in an army: and those men who carry out the first, will easily observe the second: but without the first, one can never arrive at the discipline of the second. Each of these Companies, therefore, can by themselves learn to maintain(discipline in) their ranks in every kind and place of action and then to know how to assemble to know its (particular bugle)call, through which it is commanded in battle; to know how to recognise by it [as galleys do from the whistle] as to what they have to do, whether to stay put, or go forward, or turn back, or the time and place to use their arms. So that knowing how to maintain ranks well, so that neither the action nor the placed is organises them, they understand well the commands of the leader by means of the (bugle) calls. and knowing how to reassemble quickly, these Companies then can easily [as I have said], when many have come together, learn to do what each body of them is obligated to do together with other Companies in operating as a reasonably(sized) army. And as such a general practice also is not to be esteemed little, all the Battalions can be brought together once or twice in the years of peace, and give them a form of a complete army, training it for several days as if it should engage in battle, placing the front lines, the flanks, and auxiliaries in their(proper) places.

And as a Captain arranges his army for the engagement either taking into account the enemy he sees, or for that which he does not see but is apprehensive of, the army ought to be trained for both contingencies, and instructed so that it can march and fight when the need arises: showing your soldiers how they should conduct themselves if they should be assaulted by this band or that. And when you instruct them to fight against an enemy they can see, show them how the battle is enkindled, where they have to retire without being repulsed, who has to take their places, what signs, what (bugle) calls, and what voice they should obey, and to practice them so with Companies and by mock attacks, that they have the desire for real battle. For a courageous army is not so because the men in it are courageous, but because the ranks are well disciplined; for if I am of the first line fighters, and being overcome, I know where I have to retire, and who is to take my place, I will always fight with courage seeing my succor nearby: If I am of the second line fighters, I would not be dismayed at the first line being pushed back and repulsed, for I would have presupposed it could happen, and I would have desired it in order to be he who, as it was not them, would give the victory to my patron. Such training is most necessary where a new army is created; and where the army is old (veteran), it is also necessary for, as the Romans show, although they knew the organisation of their army from childhood, none the less, those Captains, before they came to an encounter with the enemy, continually exercised the min those disciplines. And Joseph in his history says, that the continual training of the Roman armies resulted in all the

disturbance which usually goes on for gain in a camp, was of no effect in an engagement, because everyone knew how to obey orders and to fight by observing them. But in the armies of new men which you have to put together to combat at the time, or that you caused to be organised to combat in time, nothing is done without this training, as the Companies are different as in a complete army; for as much discipline is necessary, it must be taught with double the industry and effort to those who do not have it, and be maintained in those who have it, as is seen from the fact that many excellent Captains have tired themselves without any regard to themselves.

COSIMO: And it appears to me that this discussion has somewhat carried you away, for while you have not yet mentioned the means with which Companies are trained, you have discussed engagements and the complete army.

FABRIZIO: You say the truth, and truly the reason is the affection I have for these orders, and the sorrow that I feel seeing that they are not put into action: none the less, have no fear, but I shall return to the subject. As I have told you, of first importance in the training of the Company is to knowhow to maintain ranks. To do this, it is necessary to exercise them in those orders, which they called Chiocciole (Spiralling). And as I told you that one of these Companies ought to consist of four hundred heavily armed infantry, I will stand on this number. They should, therefore, be arranged into eighty ranks (files), with five per file. Then continuing on either strongly or slowly, grouping them and dispersing them; which, when it is done, can be demonstrated better by deeds than by words: afterwards, it becomes less necessary, for anyone who is practiced in these exercises knows how this order proceeds, which is good for nothing else but to accustom the soldiers to maintain ranks. But let us come and put together one of those Companies.

I say that these can be formed in three ways: the first and most useful is to make it completely massive and give it the form of two squares: the second is to make the square with a homed front: the third is to make it with a space in the center, which they call Piazza (plaza). The method of putting together the first form can be in two steps. The first is to have the files doubled, that is, that the second file enters the first, the fourth into the third, and sixth into the fifth, and so on in succession; so that where there were eighty files and five (men) per file, they become forty files and ten per file. Then make them double another time in the same manner, placing one file within the other, and thus they become twenty files of twenty men per file. This makes almost a square, for although there are so many men on one side (of the square) as the other, none the less, on the side of the front, they come together so that (the side of) one man touches the next; but on the other side (of the square) the men are distant at least two arm lengths from each other, so that the square is longer from the front to the back (shoulders), then from one side (flank) to the other. (So that the rectangle thus formed is called two squares).

And as we have to talk often today of the parts in front, in the rear, and on the side of this Company, and of the complete army, you will understand that when I will say either head or front, I mean to say the part in front; when I say shoulder, the part behind (rear); when I say flanks, the parts on the side.

The fifty ordinary Veliti of the company are not mixed in with the other files, but when the company is formed, they extend along its flanks.

The other method of putting together (forming) the company is this; and because it is better than the first, I want to place in front of your eyes in detail how it ought to be organised. I believe you remember the number of men and the heads which compose it, and with what arms it is armed. The form, therefore, that this company ought to have is [as I have said] of twenty files, twenty men per file, five files of pikemen in front, and fifteen files of shield bearers on the shoulders (behind); two centurions are in front and two behind in the shoulders who have the office of those whom the ancients called Tergiduttori (Rear-leaders): The Constable, with the flag and bugler, is in that space which is between the five files of pikemen and the fifteen of shield-bearers: there is one of the Captains of the Ten on every flank, so that each one is alongside his men, those who are on the left side of his right hand, those on the right side on his left hand. The fifty Veliti are on the flanks and shoulders (rear) of the company. If it is desired, now, that regular infantry be employed, this company is put together in this form, and it must organise itself thusly: Have the infantry be brought to eighty files, five per file, as we said a little while ago; leaving the Veliti at the head and on the tail (rear), even though they are outside this arrangement; and it ought to be so arranged that each Centurion has twenty files behind him on the shoulders, and those immediately behind every Centurion are five files of pikemen, and the remaining shield-bearers: the Constable, with his flag and bugler, is in that space that is between the pikemen and the shield-bearers of the second Centurion, and occupies the places of three shield-bearers: twenty of the Heads of Ten are on the Flanks of the first Centurion on the left hand, and twenty are on the flanks of the last Centurion on the right hand. And you have to understand, that the Head

ofTen who has to guide (lead) the pikemen ought to have a pike, and those who guide the shield-bearers ought to have similar arms.

The files, therefore, being brought to this arrangement, and if it is desired, by marching, to bring them into the company to form the head (front), you have to cause the first Centurion to stop with the first file of twenty, and the second to continue to march; and turning to the right (hand) he goes along the flanks of the twenty stopped files, so that he comes head-tohead with the other Centurion, where he too stops; and the third Centurion continues to march, also turning to the right (hand), and marches along the flanks of the stopped file so that he comes head-to-head with the other two Centurions; and when he also stops, the other Centurion follows with his file, also going to the right along the flanks of the stopped file. so that he arrives at the head(front) with the others, and then he stops; and the two Centurions who are alone quickly depart from the front and go to the rear of the company, which becomes formed in that manner and with those orders to the point which we showed a little while ago. The Veliti extend themselves along its flanks, according as they were disposed in the first method; which method is called Doubling by the straightline, and this last (method) is called Doubling by the flanks.

The first method is easier, while this latter is better organised, and is more adaptable, and can be better controlled by you, for it must be carried out by the numbers, that from five you make ten, ten twenty, twenty forty: so that by doubling at your direction, you cannot make a front of fifteen, or twenty five or thirty or thirty five, but you must proceed to where the number is less. And yet, every day, it happens in particular situations, that you must make a front with six or eight hundred infantry, so that the doubling by the straight line will disarrange you: yet this(latter) method pleases me more, and what difficulty may exist, can be more easily overcome by the proper exercise and practice of it.

I say to you, therefore, that it is more important than any thing to have soldiers who know how to form themselves quickly, and it is necessary in holding them in these Companies, to train them thoroughly, and have them proceed bravely forward or backward, to pass through difficult places without disturbing the order: for the soldiers who know how to do this well, are experienced soldiers, and although they may have never met the enemy face to face, they can be called seasoned soldiers; and, on the contrary, those who do not know how to maintain this order, even if they may have been in a thousand wars, ought always to be considered as new soldiers. This applies in forming them when they are marching in small files: but if they are formed, and then become broken because of some accident that results either from the location or from the enemy, to reorganise themselves immediately is the important and difficult thing, in which much training and practice is needed, and in which the ancients placed much emphasis. It is necessary, therefore, to do two things: first, to have many countersigns in the Company: the other, always to keep this arrangement, that the same infantry always remain in the same file. For instance, if one is commanded to be in the second (file), he will afterwards always stay there, and not only in this same file, but in the same position (in the file); it is to be observed [as I have said] how necessary are the great number of countersigns, so that, coming together with other companies, it may be recognised by its own men. Secondly, that the Constable and Centurion have tufts of feathers on their head-dress different and recognisable, and what is more important, to arrange that the Heads of Ten be recognised. To which the ancients paid very much attention, that nothing else would do, but that they wrote numbers on their bucklers, calling then the first, second, third, fourth, etc. And they were not above content with this, but each soldier had to write on his shield the number of his file, and the number of his place assigned him in that file. The men, therefore, being thus countersigned(assigned), and accustomed to stay within these limits, if they should be disorganised, it is easy to reorganise them all quickly, for the flag staying fixed, the Centurions and Heads of Ten can judge their place by eye, and bring the left from the right, or the right from the left, with the usual distances between; the infantry guided by their rules and by the difference in countersigns, can quickly take their proper places, just as, if you were the staves of a barrel which you had first countersigned, I would wager you would put it (the barrel) back together with great ease, but if you had not so countersigned them (the staves), it is impossible to reassemble (the barrel). This system, with diligence and practice, can be taught quickly, and can be quickly learned, and once learned are forgotten with difficulty; for new men are guided by the old, and in time, a province which has such training, would become entirely expert in war. It is also necessary to teach them to turn in step, and do so when he should turn from the flanks and by the soldiers in the front or from the front to the flanks or shoulders (rear). This is very easy, for it is sufficient only that each man turns his body toward the side he is commanded to, and the direction in which they turned becomes the front. It is true that when they turn by the flank, the ranks which turn go outside their usual area, because there is a small space between the breast to the shoulder, while from one flank to the other there is much space, which is all contrary to the regular formation of the company. Hence, care should be used in employing it. But this is more important and where more practice is needed, is when a company wants to turn entirely, as if it was a solid body. Here, great care and practice must be employed, for if it is desired to turn to the left, for instance, it is necessary that the left wing be halted, and those who are closer to the halted one, march much slower then those who are in the right wing and have to run; otherwise everything would be in confusion.

But as it always happens when an army marches from place to place, that the companies not situated in front, not having to combat at the front, or at the flanks or shoulders (rear). have to move from the flank or shoulder quickly to the front. and when such companies in such cases have the space necessary as we indicated above, it is necessary that the pikemen they have on that flank become the front, and the Heads of the Ten, Centurions, and Constables belonging to it relocate to their proper places. Therefore, in wanting to do this, when forming them it is necessary to arrange the eighty files of five per file, placing all the pikemen in the first twenty files, and placing five of the Heads of Ten (of it) in the front of them and five in the rear: the other sixty files situated behind are all shield-bearers, who total to three hundred. It should therefore be so arranged, that the first and last file of every hundred of Heads of Ten; the Constable with his flag and bugler be in the middle of the first hundred (century) of shieldbearers; and the Centurions at the head of every century. Thus arranged, when you want the pikemen to be on the left flank, you have to double them, century by century, from the right flank: if you want them to be on the right flank, you have to double them from the left. And thus this company turns with the pikemen on the flank, with the Heads of Ten on the front and rear, with the Centurions at the front of them, and the Constable in the middle. Which formation holds when going forward; but when the enemy comes and the time for the (companies) to move from the flanks to the front, it cannot be done unless all the soldiers face toward the flank where the pikemen are, and then the company is turned with its files and heads in that manner that was described above: for the Centurions being on the outside, and all the men in their places, the Centurions quickly enter them (the ranks)without difficulty. But when they are marching front wards, and have to combat in the rear, they must arrange the files so that, in forming the company, the pikes are situated in the rear; and to do this, no other order has to be maintained except that where, in the formation of the company ordinarily every Century has five files of pikemen in front, it now has them behind, but in all the other parts, observe the order that I have mentioned.

COSIMO: You have said [if I remember well] that this method of training is to enable them to form these companies into an army, and that this training serves to enable them to be arranged within it. But if it should occur that these four hundred fifty infantry have to operate as a separate party, how would you arrange them?

FABRIZIO: I will now guide you in judging where he wants to place the pikes, and who should carry them, which is not in any way contrary to the arrangement mentioned above, for although it may be the method that is observed when, none the less, it is a rule that serves for all those methods, in which it should happen that you have to manage it. But in showing you the other two methods for arranging the companies, proposed by me, I will also better satisfy your question; for either they are never used, or they are used when the company is above, and not in the company of others.

And to come to the method of forming it with two horns (wings), I say, that you ought to arrange the eighty files at five per file in this way: place a Centurion in the middle, and behind him twenty five files that have two pikemen (each) on the left side, and three shield-bearers on the right: and after the first five, in the next twenty, twenty Heads of Ten be placed, all between the pikemen and shield-bearers, except that those (Heads) who carry pikes stay with the pikemen. Behind these twenty five files thusly arranged, another Centurion is placed who has fifteen files of shield-bearers behind him. After these, the Constable between the flag and the bugler, who also has behind him another fifteen files of shield-bearers. The third Centurion is placed behind these, and he has twenty five files behind him, in each of which are three shield-bearers on the left left side and two pikemen on the right: and after the first five files are twenty Heads of Ten placed between the pikemen and the shield-bearers. After these files, there is the fourth Centurion. If it is desired, therefore, to arrange these files to form a company with two horns(wings), the first Centurion has to be halted with the twenty five files which are behind him. The second Centurion then has to be moved with the fifteen shield-bearers who are on his rear, and turning to the right, and on the right flank of the twenty five files to proceed so far that he comes to the fifteen files, and here he halts. After, the Constable has to be moved with the fifteen files of shield bearers who are behind.

and turning around toward the right, over by the right flank of the fifteen files which were moved first, marches so that he comes to their front, and here he halts. After, move the third Centurion with the twenty five files and with the fourth Centurion who is behind them, and turning to the right, march by the left flank of the last fifteen files of shield-bearers. and he does not halt until he is at the head of them, but continues marching up until the last files of twenty five are in line with the files behind. And, having done this, the Centurion who was Head of the first fifteen files of shieldbearers leaves the place where he was, and goes to there ar of the left angle. And thus he will turn a company of twenty five solid files, of twenty infantry per file, with two wings, on each side of his front, and there will remain a space between then. as much as would (be occupied by) by ten men side by side. The Captain will be between the two wings, and a Centurion in each corner of the wing. There will be two files of pikemen and twenty Heads of Ten on each flank. These two wings (serve to)hold between them that artillery, whenever the company has any with it, and the carriages. The Veliti have to stay along the flanks beneath the pikemen. But, in wanting to bring this winged(formed) company into the form of the piazza (plaza), nothing else need be done than to take eight of the fifteen files of twenty per file and place them between the points of the two horns (wings), which then from wings become the rear (shoulder) of the piazza(plaza). The carriages are kept in this plaza, and the Captain and the flag there, but not the artillery, which is put either in the front or along the flanks. These are the methods which can be used by a company when it has to pass by suspicious places by itself. None the less, the solid company, without wings and without the plaza, is best. But in wanting to make safe the disarmed ones, that winged one is necessary.

The Swiss also have many forms of companies, among which they form one in the manner of a cross, as in the spaces between the arms, they keep their gunners safe from the attacks of the enemy. But since such companies are good in fighting by themselves, and my intention is to show how several companies united together combat with the enemy, I do not belabor myself further in describing it.

COSIMO: And it appears to me I have very well comprehended the method that ought to be employed in training the men in these companies, but [if I remember well] you said that in addition to the ten companies in a Battalion, you add a thousand extraordinary pikemen and four hundred extraordinary Veliti. Would you not describe how to train these?

FABRIZIO: I would, and with the greatest diligence: and I would train the pikemen, group by group, at least in the formations of the companies, as the others; for I would serve myself of these more than of the ordinary companies, in all the particular actions, how to escort, to raid, and such things. But the Veliti I would train at home without bringing them together with the others, for as it is their office to combat brokenly(in the open, separately), it is not as necessary that they come together with the others or to train in common exercises, than to train them well in particular exercises. They ought, therefore, [as was said in the beginning, and now it appears to me laborious to repeat it] to train their own men in these companies so that they know how to maintain their ranks, know their places, return there quickly when either the evening or the location disrupts them: for when this is caused to be done, they can easily be taught the place the company has to hold and what its office should be in the armies. And if a Prince or a Republic works hard and puts diligence in these formations and in this training, it will always happen that there will be good soldiers in that country, and they will be superior to their neighbours, and will be those who give, and not receive, laws from other men. But [as I have told you]the disorder in which one exists, causes them to disregard and not to esteem these things, and, therefore, our training is not good: and even if there should be some heads or members naturally of virtue, they are unable to demonstrate it.

COSIMO: What carriages would you want each of these companies to have?

FABRIZIO: The first thing I would want is that the Centurions or the Heads of Ten should not go on horseback: and if the Constables want to ride mounted, I would want them to have a mule and nota horse. I would permit them two carriages, and one to each Centurion, and two to every three Heads of Ten, for they would quarter so many in each encampment, as we will narrate in its proper place. So that each company would have thirty six carriages, which I would have (them) to carry the necessary tents, cooking utensils, hatchets, digging bars, sufficient to make the encampment, and after that anything else of convenience.

COSIMO: I believe that Heads assigned by you in each of the companies are necessary: none the less, I would be apprehensive that so many commanders would be confusing.

FABRIZIO: They would be so if I would refer to one, but as I refer to many, they make for order; actually, without those (orders), it would be impossible to control them, for a wall which inclines on every side would need many and frequent supports, even if they are not so strong, but if few, they must

remedy any ruin. And so it must be that in the armies and among every ten men there is one of more life, of more heart, or at least of more authority, who with his courage, with words and by example keeps the others firm and disposed to fight. And these things mentioned by me, as the heads, the flags, the buglers, are necessary in an army, and it is seen that we have all these in our (present day) armies, but no one does his duty. First, the Heads of Ten, in desiring that those things be done because they are ordered, it is necessary [as I have said] for each of them to have his men separate, lodge with them, go into action with them, stay in the ranks with them, for when they are in their places, they are all of mind and temperament to maintain their ranks straight and firm, and it is impossible for them to become disrupted, or if they become disrupted, do not quickly reform their ranks. But today, they do not serve us for anything other than to give them more pay than the others, and to have them do some particular thing. The same happens with the flags, for they are kept rather to make a beautiful show, than for any military use. But the ancients served themselves of it as a guide and to reorganise themselves, for everyone, when the flag was standing firm, knew the place that he had to be near his flag, and always returned there. He also knew that if it were moving or standing still, he had to move or halt. It is necessary in an army, therefore, that there be many bodies, and that each body have its own flag and its own guide; for if they have this, it needs must be they have much courage and consequently, are livelier. The infantry, therefore, ought to march according to the flag, and the flag move according to the bugle (call), which call, if given well, commands the army, which proceeding in step with those, comes to serve the orders easily. Whence the ancients having whistles(pipes), fifes, and bugles, controlled (modulated) them perfectly; for, as he who dances proceeds in time with the music, and keeping with it does not make a miss-step, so an army obedient in its movement to that call (sound), will not become disorganised. And, therefore, they varied the calls according as they wanted to enkindle or quiet, or firm the spirits of men. And as the sounds were various, so they named them variously. The Doric call (sound) brought on constancy, Frigio, fury (boldness): whence they tell, that Alexander being at table, and someone sounding the Frigio call, it so excited his spirit that he took up arms. It would be necessary to rediscover all these methods, and if this is difficult, it ought not at least to be (totally) put aside by those who teach the soldier to obey; which each one can vary and arrange in his own way, so long as with practice he accustoms the ears of his soldiers to recognise them But today no benefit is gotten from these sounds in great part, other than to make noise.

COSIMO: I would desire to learn from you, if you have ever pondered this with yourself, whence such baseness and disorganisation arises, and such negligence of this training in our times?

FABRIZIO: I will tell you willingly what I think. You know of the men excellent in war there have been many famed in Europe, few in Africa, and less in Asia. This results from (the fact that) these last two parts of the world have had a Principality or two, and few Republics; but Europe alone has had some Kingdoms and an infinite number of Republics. And men become excellent, and show their virtu, according as they are employed and recognised by their Prince, Republic, or King, whichever it may be. It happens, therefore, that where there is much power, many valiant men spring up, where there is little, few. In Asia, there are found Ninus, Cyrus, Artafersus, Mithradates, and very few others to accompany these. In Africa, there are noted [omitting those of ancient Egypt] Maximinius, Jugurtha, and those Captains who were raised by the Carthaginian Republic, and these are very few compared to those of Europe; for in Europe there are excellent men without number, and there would be many more, if there should be named together with them those others who have been forgotten by them alignity of the time, since the world has been more virtuous when there have been many States which have favored virtu, either from necessity or from other human passion. Few men, therefore, spring up in Asia, because, as that province was entirely subject to one Kingdom. in which because of its greatness there was indolence for the most part, it could not give rise to excellent men in business (activity). The same happened in Africa: yet several, with respect to the Carthaginian Republic, did arise. More excellent men come out of Republics than from Kingdoms. because in the former virtu is honoured much of the time, in the Kingdom it is feared; whence it results that in the former, men of virtu are raised, in the latter they are extinguished. Whoever, therefore, considers the part of Europe, will find it to have been full of Republics and Principalities, which from the fear one had of the other, were constrained to keep alive their military organisations, and honour those who greatly prevailed in them. For in Greece, in addition to the Kingdom of the Macedonians, there were many Republics, and many most excellent men arose in each of them. In Italy, there were the Romans, the Samnites, the Tuscans, the Cisalpine Gauls. France and Germany were full of Republics and Princes. Spain, the very same. And although in comparison with the

Romans, very few others were noted, it resulted from the malignity of the writers, who pursued fortune and to whom it was often enough to honour the victors. For it is not reasonable that among the Samnites and Tuscans, who fought fifty years with the Roman People before they were defeated, many excellent men should not have sprung up. And so likewise in France and Spain. But that virtu which the writers do not commemorate in particular men, they commemorate generally in the peoples, in which they exalt to the stars (skies) the obstinacy which existed in them in defending their liberty. It is true, therefore, that where there are many Empires, more valiant men spring up, and it follows, of necessity, that those being extinguished, little by little, virtu is extinguished, as there is less reason which causes men to become virtuous. And as the Roman Empire afterwards kept growing, and having extinguished all the Republics and Principalities of Europe and Africa, and in greater part those of Asis, no other path to virtu was left, except Rome. Whence it resulted that men of virtu began to be few in Europe as in Asia, which virtu ultimately came to decline; for all the virtu being brought to Rome, and as it was corrupted, so almost the whole world came to be corrupted, and the Scythian people were able to come to plunder that Empire, which had extinguished the virtu of others, but did not know how to maintain its own. And although afterwards that Empire, because of the inundation of those barbarians, became divided into several parts, this virtu was not renewed: first, because a price is paid to recover institutions when they are spoiled; another, because the mode of living today, with regard to the Christian religion, does not impose that necessity to defend it that anciently existed, in which at the time men, defeated in war, were either put to death or remained slaves in perpetuity, where they led lives of misery: the conquered lands were either desolated or the inhabitants driven out, their goods taken away, and they were sent dispersed throughout the world, so that those overcome in war suffered every last misery. Men were terrified from the fear of this, and they kept their military exercises alive, and honoured those who were excellent in them. But today, this fear in large part is lost, and few of the defeated are put to death, and no one is kept prisoner long, for they are easily liberated. The Citizens, although they should rebel a thousand times, are not destroyed, goods are left to their people, so that the greatest evil that is feared is a ransom; so that men do not want to subject themselves to dangers which they little fear. Afterwards, these provinces of Europe exist under very few Heads as compared to the past, for all of France obeys a King, all of Spain another, and Italy exists in a few parts; so that weak Cities defend themselves by allving themselves with the victors, and strong States, for the reasons mentioned, do not fear an ultimate ruin.

COSIMO: And in the last twenty five years, many towns have been seen to be pillaged, and lost their Kingdoms; which examples ought to teach others to live and reassume some of the ancient orders.

FABRIZIO: That is what you say, but if you would note which towns are pillaged, you would not find them to be the Heads(Chief ones) of the States, but only members: as is seen in the sacking of Tortona and not Milan, Capua and not Naples, Brescia and not Venice, Ravenna and not Rome. Which examples do not cause the present thinking which governs to change, rather it causes them to remain in that opinion of being able to recover themselves by ransom: and because of this, they do not want to subject themselves to the bother of military training, as it appears to them partly unnecessary, partly a tangle they do not understand. Those others who are slave, to whom such examples ought to cause fear, do not have the power of remedying (their situation), and those Princes who have lost the State, are no longer in time, and those who have (the State) do not have (military training) and those Princes who have lost the State, are no longer in time, and those who have (the State) do not have (military training) or want it; for they want without any hardship to remain (in power) through fortune, not through their own virtu, and who see that, because there is so little virtu, fortune governs everything, and they want it to master them, not they master it. And that that which I have discussed is true, consider Germany, in which, because there are many Principalities and Republics, there is much virtu, and all that is good in our present army, depends on the example of those people, who, being completely jealous of their State [as they fear servitude, which elsewhere is not feared] maintain and honour themselves all us Lords. I want this to suffice to have said in showing the reasons for the present business according to my opinion. I do not know if it appears the same to you, or if some other apprehension should have risen from this discussion

COSIMO: None, rather I am most satisfied with everything. I desire above, returning to our principal subject, to learn from you how you would arrange the cavalry with these companies, and how many, how captained, and how armed.

FABRIZIO: And it, perhaps, appears to you that I have omitted these, at which do not be surprized, for I speak little of them for two reasons: one, because this part of the army is **THE GRAND BIBLE** provided for such a result, and were led back among those

who were not armed:after this proceeding, the Astati came

less corrupt than that of the infantry, for it is not stronger than the ancient, it is on a par with it. However, a short while before, the method of training them has been mentioned. And as to arming them, I would arm them as is presently done, both as to the light cavalry as to the men-at-arms. But I would want the light cavalry to be all archers, with some light gunners among them, who, although of little use in other actions of war, are most useful in terrifying the peasants, and place them above a pass that is to be guarded by them, for one gunner causes more fear to them (the enemy) than twenty other armed men. And as to numbers, I say that departing from imitating the Roman army, I would have not less than three hundred effective cavalry for each battalion, of which I would want one hundred fifty to be men-at-arms, and a hundred fifty light cavalry; and I would give a leader to each of these parts, creating among them fifteen Heads of Ten per hand, and give each one a flag and a bugler. I would want that every ten men-at-arms have five carriages and every ten light cavalrymen two, which, like those of the infantry, should carry the tents, (cooking) utensils, hitches, poles, and in addition over the others their tools. And do not think this is out of place seeing that men-at-arms have four horses at their service, and that such a practice is a corrupting one; for in Germany, it is seen that those men-at-arms are alone with their horses, and only every twenty have a cart which carries the necessary things behind them. The horsemen of the Romans were likewise alone:it is true that the Triari encamped near the cavalry and were obliged to render aid to it in the handling of the horses: this can easily be imitated by us, as will be shown in the distribution of quarters. That, therefore, which the Romans did, and that which the Germans do, we also can do; and in not doing it, we make a mistake. These cavalrymen, enrolled and organised together with a battalion, can often be assembled when the companies are assembled, and caused to make some semblance of attack among them, which should be done more so that they may be recognised among them than for any necessity. But I have said enough on this subject for now, and let us descend to forming an army which is able to offer battle to the enemy, and hope to win it; which is the end for which an army is organised, and so much study put into it.

MACHIAVELLI ART OF WAR, 3RD BOOK

COSIMO: Since we are changing the discussion, I would like the questioner to be changed, so that I may not be held ta be presumptuous, which I have always censured in others. I, therefore, resign the speakership, and I surrender it to any of these friends of mine who want it.

ZANOBI: It would be most gracious of you to continue:but since you do not want to, you ought at least to tell us which of us should succeed in your place.

COSIMO: I would like to pass this burden on the Lord Fabrizio.

FABRIZIO: I am content to accept it, and would like to follow the Venetian custom, that the youngest talks first; for this being an exercise for young men, I am persuaded that young men are more adept at reasoning, than they are quick to follow.

COSIMO: It therefore falls to you LUIGI: and I am pleased with such a successor, as long as you are satisfied with such a questioner.

FABRIZIO: I am certain that, in wanting to show how an army is well organised for undertaking an engagement, it would be necessary to narrate how the Greeks and the Romans arranged the ranks in their armies. None the less, as you yourselves are able to read and consider these things, through the medium of ancient writers. I shall omit many particulars, and will cite only those things that appear necessary for me to imitate, in the desire in our times to give some (part of) perfection to our army. This will be done, and, in time, I will show how an army is arranged for an engagement, how it faces a real battle, any how it can be trained in mock ones. The greatest mistake that those men make who arrange an army for an engagement, is to give it only one front, and commit it to only one onrush and one attempt(fortune). This results from having lost the method the ancients employed of receiving one rank into the other; for without this method, one cannot help the rank in front, or defend them, or change them by rotation in battle, which was practiced best by the Romans. In explaining this method, therefore, I want to tell how the Romans divided each Legion into three parts, namely, the Astati, the Princeps, and the Triari; of whom the Astati were placed in the first line of the army in solid and deep ranks,(and) behind them were the Princeps, but placed with their ranks more open: and behind these they placed the Triari, and with ranks so sparse, as to be able, if necessary, to receive the Princeps and the Astati between them. In addition to these, they had slingers, bowmen (archers) and other lightly armed who were not in these ranks, but were situated at the head of the army between the cavalry man the infantry. These light armed men, therefore, enkindled the battle, and if they won [which rarely happened], they pursued the victory: if they were repulsed, they retired by way of the flanks of the army, or into the intervals (gaps)

hand to hand with the enemy, and who, if they saw themselves being overcome, retired little by little through the open spaces in the ranks of the Princeps, and, together with them, renewed the fight. If these also were forced back, they all retired into the thin lines of the Triari, and all together, en masse, recommenced the battle; and if these were defeated, there was no other remedy, as there was no way left to reform themselves. The cavalry were on the flanks of the army, placed like two wings on a body, and they some times fought on horseback, and sometimes helped the infantry, according as the need required. This method of reforming themselves three times is almost impossible to surpass, as it is necessary that fortune abandon you three times, and that the enemy has so much virtu that he overcomes you three times. The Greeks, with their Phalanxes, did not have this method of reforming themselves, and although these had many ranks and Leaders within them, none the less, they constituted one body, or rather, one front. So that in order to help one another, they did not retire from one rank into the other, as the Romans but one man took the place of another, which they did in this way. Their Phalanxes were (made up) of ranks, and supposing they had placed fifty men per rank, when their front came against the enemy, only the first six ranks of all of them were able to fight, because their lances, which they called Sarisse, were so long, that the points of the lances of those in the sixth rank reached past the front rank. When they fought, therefore, if any of the first rank fell, either killed or wounded, whoever was behind him in the second rank immediately entered into his place, and whoever was behind him in the third rank immediately entered into the place in the second rank which had become vacant, and thus successively all at once the ranks behind restored the deficiencies of those in front, so that the ranks were always remained complete, and no position of the combatants was vacant except in the last rank, which became depleted because there was no one in its rear to restore it. So that the injuries which the first rank suffered, depleted the last, and the first rank always remained complete; and thus the Phalanxes, because of their arrangement, were able rather to become depleted than broken, since the large(size of its) body made it more immobile. The Romans, in the beginning, also employed Phalanxes, and instructed their Legions in a way similar to theirs. Afterwards, they were not satisfied with this arrangement, and divided the Legion into several bodies; that is, into Cohorts and Maniples; for they judged [as was said a little while ago] that that body should have more life in it(be more active) which should have more spirit, and that it should be composed of several parts, and each regulate itself. The Battalions of the Swiss, in these times, employed all the methods of the Phalanxes, as much in the size and entirety of their organisation, as in the method of helping one another, and when coming to an engagement they place the Battalions one on the flank of the other, or they place them one behind the other. They have no way in which the first rank, if it should retire, to be received by the second, but with this arrangement, in order to help one another, they place one Battalion in front and another behind it to the right, so that if the first has need of aid, the latter can go forward and succor it. They put a third Battalion behind these, but distant a gun shot. This they do, because if the other two are repulsed, this (third) one can make its way forward, and the others have room in which to retire, and avoid the onrush of the one which is going forward; for a large multitude cannot be received (in the same way) as a small body, and, therefore, the small and separate bodies that existed in a Roman Legion could be so placed together as to be able to receive one another among themselves, and help each other easily. And that this arrangement of the Swiss is not as good as that of the ancient Romans is demonstrated by the many examples of the Roman Legions when they engaged in battle with the Greek Phalanxes, and the latter were always destroyed by the former, because the kinds of arms [as I mentioned before] and this method of reforming themselves, was not able to maintain the solidity of the Phalanx. With these examples, therefore, if I had to organise an army. I would prefer to retain the arms and the methods, partly of the Greek Phalanxes, partly of the Roman Legions; and therefore I have mentioned wanting in a Battalion two thousand pikes, which are the arms of the Macedonian Phalanxes, and three thousand swords and shield. which are the arms of the Romans. I have divided the Battalion into ten Companies, as the Romans (divided) the Legion into ten Cohorts. I have organised the Veliti, that is the light armed, to enkindle the battle, as they (the Romans did). And thus, as the arms are mixed, being shared by both nations and as also the organisations are shared, I have arranged that each company have five ranks of pikes (nikemen)in front and the remainder shields (swordsmen with shields) in order to be able with this front to resist the cavalry, and easily penetrate the enemy companies on foot, and the enemy at the first encounter would meet the pikes, which I would hope would suffice to resist him, and then the shields (swordsmen) would defeat him. And if you would note the virtu of this arrangement, you will see all these arms will

Copyright © 2018 by Lord Henfield, Guildford Scientific Press PAGE 3383 execute their office completely. First, because pikes are useful against cavalry, and when they come against infantry, they do their duty well before the battle closes in, for when they are pressed, they become useless. Whence the Swiss, to avoid this disadvantage, after every three ranks of pikemen place one of halberds, which, while it is not enough, gives the pikemen room (to maneuver). Placing, therefore, our pikes in the front and the shields (swordsmen) behind, they manage to resist the cavalry, and in enkindling the battle closes in, and they become useless, the shields and swords take their place, who are able to take care of themselves in every strait.

LUIGI: We now await with desire to learn how you would arrange the army for battle with these arms and with these organisations.

FABRIZIO: I do not now want to show you anything else other than this. You have to understand that in a regular Roman army, which they called a Consular Army, there were not more than two Legions of Roman Citizens, which consist of six hundred cavalry man about eleven thousand infantry. They also had as many more infantry and cavalry which were sent to them by their friends and confederates, which they divided into two parts, and they called one the right wing, and the other the left wing, and they never permitted this (latter) infantry to exceed the number of the infantry of the Legion. They were well content that the cavalry should be greater in number. With this army which consisted of twenty two thousand infantry and about two thousand cavalry effectives, a Consul undertook every action and went on every enterprise. And when it was necessary to face a large force, they brought together two Consuls with two armies. You ought also to note that ordinarily in all three of the principal activities in which armies engage, that is, marching, camping, and fighting, they place the Legion in the middle, because they wanted that virtu in which they should trust most should be greater unity, as the discussion of all these three activities will show you. Those auxiliary infantry, because of the training they had with the infantry of the Legion, were as effective as the latter, as they were disciplined as they were, and therefore they arranged them in a similar way when organising(for) and engagement. Whoever, therefore, knows how they deployed the entire (army). Therefore, having told you how they divided a Legion into three lines, and how one line would receive the other, I have come to tell you how the entire army was organised for an engagement.

If I would want, therefore, to arrange (an army for) an engagement in imitation of the Romans, just as they had two Legions I would take two Battalions and these having been deployed, the disposition of an entire Army would be known: for by adding more people, nothing else is accomplished than to enlarge the organisation. I do not believe it is necessary that I remind you how many infantry there are in a Battalion, and that it has ten companies, and what Leaders there are per company, and what arms they have, and who are the ordinary (regular) pikemen and Veliti, and who the extraordinary. because a little while I distinctly told you, and I reminded you to commit it to memory as something necessary if you should want to understand all the other arrangements: and, therefore, I will come to the demonstration of the arrangement, without repeating these again. And it appears to me that ten Companies of a Battalion should be placed on the left flank, and the ten others of the other on the right. Those on the left should be arranged in this way. The five companies should be placed one alongside the other on the front, so that between one and the next there would be a space of four arm lengths which come to occupy an area of one hundred forty one arm lengths long, and forty wide. Behind these five Companies I would place three others, distant in a straightline from the first ones by forty arm lengths, two of which should come behind in a straight line at the ends of the five, and the other should occupy the space in the middle. Thus these three would come to occupy in length and width the same space as the five: but where the five would have a distance of four arm lengths between one another, this one would have thirty three. Behind these I would place the last two companies, also in a straightline behind the three, and distant from those three forty arm lengths, and I would place each of them behind the ends of the three, so that the space between them would be ninety one arm lengths. All of these companies arranged thusly would therefore cover (an area of) one hundred forty one arm lengths long and two hundred wide. The extraordinary pikemen I would extend along the flanks of these companies on the left side, distant twenty arm lengths from it, creating a hundred forty three files of seven per file, so that they should cover the entire length of the ten companies arranged as I have previously described; and there would remain forty files for protecting the wagons and the unarmed people in the tail of the army, (and) assigning the Heads of Ten and the Centurions in their (proper) places: and, of the three Constables, I would put one at the head, another in the middle, and the third in the last file, who should fill the office of Tergiduttore, as the ancients called the one placed in charge of the rear of the Army. But returning to the head (van) of the Army I say, that I would place the extraordinary Veliti

alongside the extraordinary pikemen, which, as you know, are five hundred, and would place them at a distance of forty arm lengths. On the side of these, also on the left hand: I would place the men-at-arms, and would assign them a distance of a hundred fifty arm lengths away. Behind these, the light cavalry, to whom I would assign the same space as the men-atarms. The ordinary Veliti I would leave around their companies, who would occupy those spaces which I placed between one company and another, who would act to minister to those (companies)unless I had already placed them under the extraordinary pikemen; which I would do or not do according as it should benefit my plans. The general Head of all the Battalions I would place in that space that exists between the first and second order of companies, or rather at the head, and in that space with exists between the last of the first five companies and the extraordinary pikemen, according as it should benefit my plans, surrounded by thirty or sixty picked men, (and) who should know how to execute a commission prudently, and stalwartly resist an attack, and should also be in the middle of the buglers and flag carriers. This is the order in which I would deploy a Battalion on the left side, which would be the deployment of half the Army. and would cover an area five hundred and eleven arm lengths long and as much as mentioned above in width, not including the space which that part of the extraordinary pikemen should occupy who act as a shield for the unarmed men, which would be about one hundred arm lengths. The other Battalions I would deploy on the right side exactly in the same way as Ideployed those on the left, having a space of thirty arm lengths between our battalions and the other, in the head of which space I would place some artillery pieces, behind which would be the Captain general of the entire Army, who should have around him in addition to the buglers and flag carriers at least two hundred picked men, the greater portion on foot, among whom should be ten or more adept at executing every command, and should be so provided with arms and a horse as to be able to go on horseback or afoot as the needs requires. Ten cannon of the artillery of the Army suffice for the reduction of towns, which should not exceed fifty pounds per charge, of which in the field I would employ more in the defense of the encampment than in waging a battle, and the other artillery should all be rather often than fifteen pounds per charge. This I would place in front of the entire army, unless the country should be such that I could situate it on the flank in a safe place, where it should not be able to be attacked by the enemy

This formation of the Army thusly arranged, in combat, can maintain the order both of the Phalanxes and of the Roman Legions, because the pikemen are in front and all the infantry so arranged in ranks, that coming to battle with the enemy. and resisting him, they should be able to reform the first ranks from those behind according to the usage of the Phalanxes. On the other hand, if they are attacked so that they are compelled to break ranks and retire, they can enter into the spaces of the second company behind them, and uniting with them, (and) en masse be able to resist and combat the enemy again: and if this should not be enough, they can in the same way retire a second time, and combat a third time, so that in this arrangement, as to combatting, they can reform according to both the Greek method, and the Roman. As to the strength of the Army, it cannot be arranged any stronger, for both wings are amply provided with both leaders and arms. and no part is left weak except that part behind which is unarmed, and even that part has its flanks protected by the extraordinary pikemen. Nor can the enemy assault it in any part where he will not find them organised, and the part in the back cannot be assaulted, because there cannot be an enemy who has so much power that he can assail every side equally, for it there is one, you don't have to take the field with him. But if he should be a third greater than you, and as well organised as you, if he weakens himself by assaulting you in several places, as soon as you defeat one part, all will go badly for him. If his cavalry should be greater than yours, be most assured, for the ranks of pikemen that gird you will defend you from every onrush of theirs, even if your cavalry should be repulsed. In addition to this, the Heads are placed on the side so that they are able easily to command and obey. And the spaces that exist between one company and the next one, and between one rank and the next, not only serve to enable one to receive the other, but also to provide a place for the messengers who go and come by order of the Captain. And as I told you before, as the Romans had about twenty thousand men in an Army, so too ought this one have: and as other soldiers borrowed their mode of fighting and the formation of their Army from the Legions, so too those soldiers that you assembled into your two Battalions would have to borrow their formation and organisation. Having given an example of these things, it is an easy matter to initiate it: for if the army is increased either by two Battalions or by as many men as are contained in them, nothing else has to be done than to double the arrangements, and where ten companies are placed on the left side, twenty are now placed, either by increasing or extending the ranks, according as the place or the enemy should command you.

LUIGI: Truly, (my) Lord, I have so imagined this army, that I see it now, and have a desire to see it facing us, and not for anything in the world would I desire you to become Fabius Maximus, having thoughts of holding the enemy at bay and delaying the engagement, for I would say worse of you, than the Roman people said of him.

FABRIZIO: Do not be apprehensive. Do you not hear the artillery? Ours has already fired, but harmed the enemy little:and the extraordinary Veliti come forth from their places together with the light cavalry, and spread out, and with as much fury and the loudest shouts of which they are capable, assault the enemy, whose artillery has fired one time, and has passed over the heads of our infantry without doing them an injury. And as it is not able to fire a second time, our Veliti and cavalry have already seized it, and to defend it, the enemy has moved forward, so that neither that of friend or enemy can perform its office. You see with what virtu our men fight, and with what discipline they have become accustomed because of the training they have had, and from the confidence they have in the Army, which you see with their stride, and with the men-at-arms alongside, in marching order, going to rekindle the battle with the adversary. Your see our artillery, which to make place for them, and to leave the space free, has retired to the place from which the Veliti went forth. You see the Captain who encourages them and points out to them certain victory. You see the Veliti and light cavalry have spread out and returned to the flanks of the Army, in order to see if they can cause any injury to the enemy from the flanks. Look, the armies are facing each other: watch with what virtu they have withstood the onrush of the enemy, and with what silence, and how the Captain commands the men-at-arms that they should resist and not attack, and do not detach themselves from the ranks of the infantry. You see how our light cavalry are gone to attack a band of enemy gunners who wanted to attach by the flank, any how the enemy cavalry have succored them, so that, caught between the cavalry of the one and the other, they cannot fire, and retire behind their companies. You see with what fury our pikemen attack them, and how the infantry is already so near each other that they can no longer manage their pikes: so that, according to the discipline taught by us, our pikemen retire little by little among the shields (swordsmen). Watch how in this (encounter), so great an enemy band of men-at-arms has pushed back our men-at-arms on the left side and how ours, according to discipline, have retired under the extraordinary pikemen, and having reformed the front with their aid, have repulsed the adversary, and killed a good part of them. In fact all the ordinary pikemen of the first company have hidden themselves among the ranks of the shields (swordsmen), and having left the battle to the swordsmen, who, look with what virtu, security, and leisure, kill the enemy. Do you not see that, when fighting, the ranks are so straitened, that they can handle the swords only with much effort? Look with what hurry the enemy moves; for, armed with the pike and their swords useless [the one because it is too long, the other because of finding the enemy too greatly armed], in part they fall dead or wounded, in part they flee. See them flee on the right side. They also flee on the left. Look, the victory is ours. Have we not won an engagement very happily? But it would have been won with greater felicity if I should have been allowed to put them in action. And see that it was not necessary to avail ourselves of either the second or third ranks. that our first line was sufficient to overcome them. In this part, I have nothing else to tell you, except to dissolve any doubts that should arise in you.

LUIGI: You have won this engagement with so much fury, that I am astonished, and in fact so stupefied, that I do not believe I can well explain if there is any doubt left in my mind. Yet, trusting in your prudence, I will take courage to say that I intend. Tell me first, why did you not let your artillery fire more than one time? and why did you have them quickly retire within the army, nor afterward make any other mention of them? It seems to me also that you pointed the enemy artillery high, and arranged it so that it should be of much benefit to you. Yet, if it should occur [and I believe it happens often1 that the lines are pierced, what remedy do you provide? And since I have commenced on artillery, I want to bring up all these questions so as not to have to discuss it any more. I have heard many disparage the arms and the organisation of the ancient Armies, arguing that today they could do little, or rather how useless they would be against the fury of artillery, for these are superior to their arms and break the ranks, so that it appears to them to be madness to create an arrangement that cannot be held, and to endure hardship in carrying a weapon that cannot defend you.

FABRIZIO: This question of yours has need [because it has so many items] of a long answer. It is true that I did not have the artillery fire more than one time, and because of it one remains in doubt. The reason is, that it is more important to one to guard against being shot than shooting the enemy. You must understand that, if you do not want the artillery to injure you, it is necessary to stay where it cannot reach you, or to put yourself behind a wall or embankment. Nothing else will stop it; but it is necessary for them to be very strong. Those Captains who must make an engagement cannot remain behind walls or embankments, nor can they remain where it may reach them. They must, therefore, since they do not have a way of protecting themselves, find one by which they are injured less; nor can they do anything other than to undertake it quickly. The way of doing this is to go find it quickly and directly, not slowly or en masse; for, speed does not allow them to shoot again, and because the men are scattered, they can injure only a few of them. A band of organised men cannot do this, because if they march in a straight line, they become disorganised, and if they scatter, they do not give the enemy the hard work to rout them, for they have routed themselves. And therefore I would organise the Army so that it should be able to do both; for having placed a thousand Veliti in its wings. I would arrange, that after our artillery had fired, they should issue forth together with the light cavalry to seize the enemy artillery. And therefore I did not have my artillery fire again so as not to give the enemy time, for you cannot give me time and take it from others. And for that, the reason I did not have it fired a second time, was not to allow it to be fired first; because, to render the enemy artillery useless, there is no other remedy than to assault it: which, if the enemy abandons it, you seize it; if they want to defend it, it is necessary that they leave it behind, so that in the hands of the enemy or of friends, it cannot be fired. I believe that, even without examples, this discussion should be enough for you, yet, being able to give you some from the ancients, I will do so. Ventidius, coming to battle with the Parthians, the virtu of whom (the latter) in great part consisted in their bows and darts, be allowed them to come almost under his encampments before he led the Army out, which he only did in order to be able to seize them quickly and not give them time to fire. Caesar in Gaul tells, that in coming to battle with the enemy, he was assaulted by them with such fury, that his men did not have time to draw their darts according to the Roman custom. It is seen, therefore, that, being in the field, if you do not want something fired from a distance to injure you, there is no other remedy than to be able to seize it as quickly as possible. Another reason also caused me to do without firing the artillery, at which you may perhaps laugh, yet I do not judge it is to be disparaged. And there is nothing that causes greater confusion in an Army than to obstruct its vision, whence most stalwart Armies have been routed for having their vision obstructed either by dust or by the sun. There is also nothing that impedes the vision than the smoke which the artillery makes when fired: I would think, therefore, that it would be more prudent to let the enemy blind himself, than for you to go blindly to find him. I would, therefore, not fire, or [as this would not be approved because of the reputation the artillery has] I would put it in the wings of the Army, so that firing it, its smoke should not blind the front of what is most important of our forces. And that obstructing the vision of the enemy is something useful, can be adduced from the example of Epaminondas, who, to blind the enemy Army which was coming to engage him, had his light cavalry run in front of the enemy so that they raised the dust high, and which obstructed their vision, and gave him the victory in the engagement. As to it appearing to you that I aimed the shots of artillery in my own manner, making it pass over the heads of the infantry, I reply that there are more times, and without comparison, that the heavy artillery does not penetrate the infantry than it does, because the infantry lies so low, and they (the artillery) are so difficult to fire, that any little that you raise them, (causes) them to pass over the heads of the infantry, and if you lower them, they damagethe ground, and the shot does not reach them (the infantry). Also, the unevenness of the ground saves them, for every little mound or height which exists between the infantry and it (the artillery), impedes it. And as to cavalry, and especially menat-arms, because they are taller and can more easily be hit. they can be kept in the rear (tail) of the Army until the time the artillery has fired. It is true that often they injure the smaller artillery and the gunners more that the latter (cavalry), to which the best remedy is to come quickly to grips (hand to hand): and if in the first assault some are killed [as some always do diel a good Captain and a good Army do not have to fear an injury that is confined, but a general one; and to imitate the Swiss, who never shun an engagement even if terrified by artillery, but rather they punish with the capital penalty those who because of fear of it either break ranks or by their person give the sign of fear. I made them [once it had been fired to retire into the Army because it left the passage free to the companies. No other mention of it was made, as something useless, once the battle was started.

You have also said in regard to the fury of this instrument that many judge the arms and the systems of the ancients to be useless, and it appears from your talk that the modems have found arms and systems which are useful against the artillery. If you know this, I would be pleased for you to show it to me, for up to now I do not know of any that have been observed, nor do I believe any can be found. So that I would like to learn from those men for what reasons the soldiers on foot of our times wear the breastplate or the corselet of iron, and those on horseback go completely covered with armour, since, condemning the ancient armour as useless with respect to artillery, they ought also to shun these. I would also like to learn for what reason the Swiss, in imitation of the ancient systems, for a close (pressed) company of six or eight thousand infantry, and for what reason all the others have imitated them, bringing the same dangers to this system because of the artillery as the others brought which had been imitated from antiquity. I believe that they would not know what to answer; but if you asked the soldiers who should have some experience. they would answer, first that they go armed because, even if that armour does not protect them from the artillery, it does every other injury inflicted by an enemy, and they would also answer that they go closely together as the Swiss in order to be better able to attack the infantry, resist the cavalry, and give the enemy more difficulty in routing them. So that it is observed that soldiers have to fear many other things besides the artillery, from which they defend themselves with armour and organisation. From which it follows that as much as an Army is better armed, and as much as its ranks are more serrated and more powerful, so much more is it secure. So that whoever is of the opinion you mentioned must be either of little prudence, or has thought very little on this matter; for if we see the least part of the ancient way of arming in use today. which is the pike, and the least part of those systems, which are the battalions of the Swiss, which do us so much good, and lend so much power to our Armies, why shouldn't we believe that the other arms and other systems that they left us are also useful? Moreover, if we do not have any regard for the artillery when we place ourselves close together, like the Swiss. what other system than that can make us afraid? inasmuch as there is no other arrangement that can make us afraid than that of being pressed together. In addition to this, if the enemy artillery does not frighten me when I lay siege to a town, where he may injure me with great safety to himself, and where I am unable to capture it as it is defended from the walls, but can stop him only with time with my artillery, so that he is able to redouble his shots as he wishes, why do I have to be afraid of him in the field where I am able to seize him quickly?So that I conclude this, that the artillery, according to my opinion, does not impede anyone who is able to use the methods of the ancients, and demonstrate the ancient virtu. And if I had not talked another time with you concerning this instrument, I would extend myself further, but I want to return to what I have now said.

LUIGI: We are able to have a very good understanding since you have so much discoursed about artillery, and in sum, it seems to me you have shown that the best remedy that one has against it when he is in the field and having an Army in an encounter, is to capture it quickly. Upon which, a doubt rises in me, for it seems to me the enemy can so locate it on a side of his army from which he can injure you, and would be so protected by the other sides, that it cannot be captured. You have [if you will remember] in your army's order for battle, created intervals of four arm lengths between one company and the next, and placed twenty of the extraordinary pikemen of the company there. If the enemy should organise his army similarly to yours, and place his artillery well within those intervals, I believe that from here he would be able to injure you with the greatest safety to himself, for it would not be possible to enter among the enemy forces to capture it.

FABRIZIO: You doubt very prudently, and I will endeavor either to resolve the doubt, or to give you a remedy. I have told you that these companies either when going out or when fighting are continually in motion, and by nature always end up close together, so that if you make the intervals small, in which you would place the artillery, in a short time, they would be so closed up that the artillery can no longer perform its function: if you make them large to avoid this danger, you incur a greater, so that, because of those intervals, you not only give the enemy the opportunity to capture your artillery. but to rout you. But you have to know that it is impossible to keep the artillery between the ranks, especially those that are mounted on carriages, for the artillery travel in one direction, and are fired in the other, so that if they are desired to be fired while travelling, it is necessary before they are fired that they be turned, and when they are being turned they need so much space, that fifty carriages of artillery would disrupt every Army. It is necessary, therefore, to keep them outside the ranks where they can be operated in the manner which we showed you a short time ago. But let us suppose they can be kept there, and that a middle way can be found, and of a kind which, when closed together, should not impede the artillery. vet not be so open as to provide a path for the enemy. I say that this is easily remedied at the time of the encounter by creating intervals in your army which give a free path for its shots, and thus its fury will be useless. Which can be easily done, because the enemy, if it wants its artillery to be safe, must place it in the end portions of the intervals, so that its shots, if they should not harm its own men, must pass in a straight line, and always in the same line, and, therefore, by giving them room, can be easily avoided. Because this is a general rule, that you must give way to those things which cannot be resisted, as the ancients did to the elephants and chariots with sickles. I believe, rather I am more than certain,

that it must appear to you that I prepared and won an engagement in my own manner; none the less. I will repeat this, if what I have said up to now is now enough, that it would be impossible for an Army thus organised and armed not to overcome, at the first encounter, every other Army organised as modem Armies are organised, which often, unless they have shields(swordsmen), do not form a front, and are of an unarmed kind, which cannot defend themselves from a near-by enemy; and so organised that, that if they place their companies on the flanks next to each other, not having a way of receiving one another, they cause it to be confused, and apt to be easily disturbed. And although they give their Armies three names, and divide them into three ranks, the Vanguard, the Company (main body) and the Rearguard, none the less, they do not serve for anything else than to distinguish them in marching and in their quarters: but in an engagement, they are all pledged to the first attack and fortune.

LUIGI: I have also noted that in making your engagement, your cavalry was repulsed by the enemy cavalry, and that it retired among the extraordinary pikemen, whence it happened that with their aid, they withstood and repulsed the enemy in the rear. I believe the pikemen can withstand the cavalry, as you said, but not a large and strong Battalion, as the Swiss do, which, in your Army, have five ranks of pikemen at the head, and seven on the flank, so that I do not know how they are able to withstand them.

FABRIZIO: Although I have told you that six ranks were employed in the Phalanxes of Macedonia at one time, none the less, you have to know that a Swiss Battalion, if it were composed often thousand tanks could not employ but four, or at most five, because the pikes are nine arm lengths long and an arm length and a half is occupied by the hands; whence only seven and a half arm lengths of the pike remain to the first rank. The second rank, in addition to what the hand occupies, uses up an arm's length of the space that exists between one rank and the next; so that not even six arm lengths of pike remain of use. For the same reasons, these remain four and one half arm lengths to the third rank, three to the fourth, and one and a half to the fifth. The other ranks are useless to inflict injury; but they serve to replace the first ranks, as we have said, and serve as reinforcements for those (first) five ranks. If, therefore, five of their ranks can control cavalry, why cannot five of ours control them, to whom five ranks behind them are also not lacking to sustain them, and give the same support, even though they do not have pikes as the others do? And if the ranks of extraordinary pikemen which are placed along the flanks seem thin to you, they can be formed into a square and placed by the flank of the two companies which I place in the last ranks of the army, from which place they would all together be able easily to help the van and the rear of the army, and lend aid to the cavalry according as their need may require.

LUIGI: Would you always use this form of organisation, when you would want to engage in battle?

FABRIZIO: Not in every case, for you have to vary the formation of the army according to the fitness of the site, the kind and numbers of the enemy, which will be shown before this discussion is furnished with an example. But this formation that is given here, not so much because it is stronger than others, which is in truth very strong, as much because from it is obtained a rule and a system, to know how to recognise the manner of organisation of the others; for every science has its generations, upon which, in good part, it is based. One thing only, I would remind you, that you never organise an army so that whoever fights in the van cannot be helped by those situated behind, because whoever makes this error renders useless the great part of the army, and if any virtu is eliminated, he cannot win.

LUIGI: And on this part, some doubt has arisen in me. I have seen that in the disposition of the companies you form the front with five on each side the center with three, and the rear with two; and I would believe that it should be better to arrange them oppositely, because I think that an army can be routed with more difficulty, for whoever should attack it, the more he should penetrate into it, so much harder would he find it: but the arrangement made by you appears to me results, that the more one enters into it, the more he finds it weak.

FABRIZIO: If you would remember that the Triari, who were the third rank of the Roman Legions, were not assigned more than six hundred men, you would have less doubt, when you leave that they were placed in the last ranks, because you will see that I (motivated by this example) have placed two companies in the last ranks, which comprise nine-hundred infantry; so that I come to err rather with the Roman people in having taken away too many, than few. And although this example should suffice, I want to tell you the reasons, which is this. The first front(line) of the army is made solid and dense because it has to withstand the attack of the enemy, and does not have to receive any friends into it, and because of this, it must abound in men, for few men would make it weak both from their sparseness and their numbers. But the second line, because it has to relieve the friends from the first who have withstood the enemy, must have large intervals, and therefore

must have a smaller number than the first; for if it should be of a greater or equal number, it would result in not leaving any intervals, which would cause disorder, or if some should be left, it would extend beyond the ends of those in front, which would make the formation of the army incomplete (imperfect). And what you say is not true, that the more the enemy enters into the Battalions, the weaker he will find them; for the enemy can never fight with the second line, if the first one is not joined up with it: so that he will come to find the center of the Battalion stronger and not weaker, having to fight with the first and second(lines) together. The same thing happens if the enemy should reach the third line, because here, he will not only have to fight with two fresh companies, but with the entire Battalion. And as this last part has to receive more men, its spaces must be larger, and those who receive them lesser in number.

LUIGI: And I like what you have said; but also answer me this. If the five companies retire among the second three, and afterwards, the eight among the third two, does it not seem possible that the eight come together then the ten together, are able to crowd together, whether they are eight or ten, into the same space which the five occupied.

FABRIZIO: The first thing that I answer is, that it is not the same space; for the five have four spaces between them, which they occupy when retiring between one Battalion and the next, and that which exists between the three or the two: there also remains that space which exists between the companies and the extraordinary pikemen, which spaces are all made large. There is added to this whatever other space the companies have when they are in the lines without being changed, for, when they are changed, the ranks are either compressed or enlarged. They become enlarged when they are so very much afraid, that they put themselves in flight: they become compressed when they become so afraid, that they seek to save themselves, not by flight, but by defense; so that in this case, they would compress themselves, and not spread out. There is added to this, that the five ranks of pikemen who are in front, once they have started the battle, have to retire among their companies in the rear (tail) of the army to make place for the shield-bearers (swordsmen) who are able to fight: and when they go into the tail of the army they can serve whoever the captain should judge should employ them well, whereas in the front, once the fight becomes mixed, they would be completely useless. And therefore, the arranged spaces come to be very capacious for the remaining forces. But even if these spaces should not suffice, the flanks on the side consist of men and not walls, who, when they give way and spread out, are able to create a space of such capacity, which should be sufficient to receive them.

LUIGI: The ranks of the extraordinary pikemen, which you place on the flank of the army when the first company retires into the second, do you want them to remain firm, and become as two wings of the army or do you also want them to retire with the company. Which, if they have to do this, I do not see how they can, as they do not have companies behind them with wide intervals which would receive them.

FABRIZIO: If the enemy does not fight them when he faces the companies to retire, they are able to remain firm in their ranks, and inflict injury on the enemy on the flank since the first companies had retired: but if they should also fight them, as seems reasonable, being so powerful as to be able to force the others to retire, they should cause them also to retire. Which they are very well able to do, even though they have no one behind who should receive them, for from the middle forward they are able to double on the right, one file entering into the other in the manner we discussed when we talked of the arrangement for doubling themselves. It is true, that when doubling, they should want to retire behind, other means must be found than that which I have shown you, since I told you that the second rank had to enter among the first, the fourth among the third, and so on little by little, and in this case, it would not be begun from the front, but from the rear, so that doubling the ranks, they should come to retire to the rear, and not to turn in front. But to reply to all of that, which (you have asked) concerning this engagement as shown by me, it should be repeated, (and) I again say that I have so organised this army, and will (again) explain this engagement to you for two reasons: one, to show you how it (the army) is organised: the other, to show you how it is trained. As to the systems, I believe you all most knowledgeable. As to the army, I tell you that it may often be put together in this form, for the Heads are taught to keep their companies in this order: and because it is the duty of each individual soldier to keep (well)the arrangement of each company, and it is the duty of each Head to keep (well) those in each part of the Army, and to know well how to obey the commands of the general Captain. They must know, therefore, how to join one company with another, and how to take their places instantly: and therefore. the banner of each company must have its number displayed openly, so that they may be commanded, and the Captain and the soldiers will more readily recognise that number. The Battalions ought also to be numbered, and have their number on their principal banner. One must know, therefore, what the number is of the Battalion placed on the

left or right wing, the number of those placed in the front and the center, and soon for the others. I would want also that these numbers reflect the grades of positions in the Army. For instance, the first grade is the Head of Ten, the second is the head of fifty ordinary Veliti, the third the Centurion, the fourth the head of the first company, the fifth that of the second (company), the sixth of the third, and so on up to the tenth Company, which should be in the second place next to the general Captain of the Battalion; nor should anyone arrive to that Leadership, unless he had (first) risen through all these grades. And, as in addition to these Heads, there are the three Constables (in command) of the extraordinary pikemen, and the two of the extraordinary Veliti, I would want them to be of the grade of Constable of the first company, nor would I care if they were men of equal grade, as long as each of them should vie to be promoted to the second company. Each one of these Captains, therefore, knowing where his Company should be located, of necessity it will follow that, at the sound of the trumpet, once the Captain's flag was raised, all of the Army would be in its proper places. And this is the first exercise to which an Army ought to become accustomed, that is, to assemble itself quickly: and to do this, you must frequently each day arrange them and disarrange them.

LUIGI: What signs would you want the flags of the Army to have, in addition to the number?

FABRIZIO: I would want the one of the general Captain to have the emblem of the Army: all the others should also have the same emblem, but varying with the fields, or with the sign, as it should seem best to the Lord of the Army, but this matters little, so long as their effect results in their recognising one another.

But let us pass on to another exercise in which an army ought to be trained, which is, to set it in motion, to march with a convenient step, and to see that, while in motion, it maintains order. The third exercise is, that they be taught to conduct themselves as they would afterwards in an engagement; to fire the artillery, and retire it; to have the extraordinary Veliti issue forth, and after a mock assault, have them retire; have the first company, as if they were being pressed, retire within the intervals of the second (company). and then both into the third, and from here each one return to its place; and so to accustom them in this exercise, that it become understood and familiar to everyone, which with practice and familiarity, will readily be learned. The fourth exercise is that they be taught to recognise commands of the Captain by virtue of his (bugle) calls and flags, as they will understand, without other command, the pronouncements made by voice. And as the importance of the commands depends on the(bugle) calls, I will tell you what sounds (calls) the ancients used. According as Thucydides affirms, whistles were used in the army of the Lacedemonians, for they judged that its pitch was more apt to make their Army proceed with seriousness and not with fury. Motivated by the same reason, the Carthaginians in their first assault used the zither Alliatus, King of the Lydians, used the zither and whistles in war; but Alexander the Great and the Romans used horns and trumpets, like those who thought the courage of the soldiers could be increased by virtue of such instruments, and cause them to combat more bravely. But just as we have borrowed from the Greek and Roman methods in equipping our Army, so also in choosing sounds should we serve ourselves of the customs of both those nations. I would, therefore, place the trumpets next to the general Captain, as their sound is apt not only to inflame the Army, but to be heard over every noise more than any other sound. I would want that the other sounds existing around the Constables and Heads of companies to be (made by) small drums and whistles, sounded not as they are presently, but as they are customarily sounded at banquets. I would want, therefore, for the Captain to use the trumpets in indicating when they should stop or go forward or turn back, when they should fire the artillery, when to move the extraordinary Veliti, and by changes in these sounds (calls) point out to the Army all those moves that generally are pointed out; and those trumpets afterwards followed by drums. And, as training in these matters are of great importance, I would follow them very much in training your Army. As to the cavalry, I would want to use the same trumpets, but of lower volume and different pitch of sounds from those of the Captain. This is all that occurs to me concerning the organisation and training of the Army.

LUIGI: I beg you not to be so serious in clearing up another matter for me: why did you have the light cavalry and the extraordinary Veliti move with shouts and noise and fury when they attacked, but they in rejoining the Army you indicated the matter was accomplished with great silence: and as I do not understand the reason for this fact, I would desire you to clarify it for me.

FABRIZIO: When coming to battle, there have been various opinions held by the ancient Captains, whether they ought either to accelerate the step (of the soldiers) by sounds, or have them go slowly in silence. This last manner serves to keep the ranks firmer and have them understand the commands of the Captain better:the first serves to encourage the men more. And, as I believe consideration ought to be given to both these methods, I made the former move with sound, and the latter in silence. And it does not seem to me that in any case the sounds are planned to be continuous, for they would impede the commands, which is a pernicious thing. Nor is it reasonable that the Romans, after the first assault, should follow with such sounds, for it is frequently seen in their histories that soldiers who were fleeing were stopped by the words and advice of the Captains, and changed the orders in various ways by his command: which would not have occurred if the sounds had overcome his voice.

MACHIAVELLI ART OF WAR, 4TH BOOK

LUIGI: Since an engagement has been won so honourably under my Rule, I think it is well if I do not tempt fortune further, knowing how changeable and unstable it is. And, therefore, I desire to resign my speakership, and that, wanting to follow the order that belongs to the youngest, Zanobi now assume this office of questioning. And I know he will not refuse this honour, or we would rather say, this hard work, as much in order to (give) pleasure, as also because he is naturally more courageous than I: nor should he be afraid to enter into these labors, where he can thus be overcome, as he can overcome.

ZANOBI: I intend to stay where you put me, even though I would more willingly stay to listen, because up to now I am more satisfied with your questions than those which occurred to me in listening to your discussions pleased me. But I believe it is well, Lords, that since you have time left, and have patience, we do not annoy you with these ceremonies of ours.

FABRIZIO: Rather you give me pleasure, because this change of questioners makes me know the various geniuses, and your various desires. Is there anything remaining of the matter discussed which you think should be added?

ZANOBI: There are two things I desire before we pass on to another part: the one is, that you would show me if there is another form of organising the Army which may occur to you: the other, what considerations ought a Captain have before going to battle, and if some accident should arise concerning it, what remedies can be made.

FABRIZIO: I will make an effort to satisfy you, I will not reply to your questions in detail; for, when I answer one, often it will also answer another. I have told you that I proposed a form for the Army which should fill all the requirements according to the (nature of) the enemy and the site, because in this case, one proceeds according to the site and the enemy. But note this, that there is no greater peril than to over extend the front of your army, unless you have a very large and very brave Army: otherwise you have to make it rather wide and of short length, than of long length and very narrow. For when you have a small force compared to the enemy, you ought to seek other remedies; for example, arrange your army so that you are girded on a side by rivers or swamps, so that you cannot be surrounded or gird yourself on the flanks with ditches, as Caesar did in Gaul. In this case, you have to take the flexibility of being able to enlarge or compress your front, according to the numbers of the enemy: and if the enemy is of a lesser number, you ought to seek wide places, especially if you have your forces so disciplined, that you are able not only to surround the enemy, but extend your ranks, because in rough and difficult places, you do not have the advantage of being able to avail yourself of (all) your ranks. Hence it happened that the Romans almost always sought open fields, and avoided the difficult ones. On the other hand [as I have said] you ought to, if you have either a small force or a poorly disciplined one, for you have to seek places where a small number can defend you, or where inexperience may not cause you injury. Also, higher places ought to be sought so as to be able more easily to attack (the enemy). None the less. one ought to be aware not to arrange your Army on a beach and in a place near the adjoining hills, where the enemy Army can come; because in this case, with respect to the artillery, the higher place would be disadvantageous to you, because you could continuously and conveniently be harmed by the enemy artillery, without being able to undertake any remedy, and similarly, impeded by your own men, you cannot conveniently injure him. Whoever organises an Army for battle, ought also to have regard for both the sun and the wind, that the one and the other do not strike the front, because both impede your vision, the one with its rays, the other with dust. And in addition, the wind does not aid the arms that are thrown at the enemy, and makes their blows more feeble. And as to the sun, it is not enough that you take care that it is not in your face at the time, but you must think about it not harming you when it comes up. And because of this, in arranging the army, I would have it (the sun) behind them, so that much time should pass before it should come in front of you. This method was observed by Hannibal at Cannae and by Marius against the Cimbrians. If you should be greatly inferior in cavalry, arrange your army between vines and trees, and such impediments, as the Spaniards did in our times when they routed the French in the Kingdom (of Naples) on the Cirignuola. And it has been frequently seen that the same soldiers, when they changed only their arrangement and the

location, from being overcome became victorious, as happened to the Carthaginians, who, after having been often defeated by Marius Regulus, were afterwards victorious, through the counsel of Xantippe, the Lacedemonian, who had them descend to the plain, where, by the virtu of their cavalry and Elephants, they were able to overcome the Romans. And it appears to me, according to the examples of the ancients, that almost all the excellent Captains, when they learned that the enemy had strengthened one side of the company, did not attack the stronger side, but the weaker, and the other stronger side they oppose to the weaker: then, when starting a battle, they cornered the stronger part that it only resist the enemy, and not push it back, and the weaker part that it allow itself to be overcome, and retire into the rear ranks of the Army. This causes two great disorders to the enemy: the first, that he finds his strongest part surrounded: the second is, that as it appears to them they will obtain the victory quickly, it happens that he will not become disorganised, whence rarely his defeat quickly results. Cornelius Scipio, when he was in Spain, (fighting) against Hasdrubal, the Carthaginian, and knowing that Hasdrubal was noted, that in arranging the Army, placed his legions in the center, which constituted the strongest part of his Army, and therefore, when Hasdrubal was to proceed in this manner, afterwards, when he came to the engagement, changed the arrangement, and put his Legions in the wings of the Army, and placed his weakest forces in the center. Then when they came hand to hand, he quickly had those forces in the center to walk slowly, and the wings to move forward swiftly: so that only the wings of both armies fought, and the ranks in the center, being distant from each other, did not join (in battle), and thus the strongest part of (the army of) Scipio came to fight the weakest part of (that of) Hasdrubal, and defeated it. This method at that time was useful, but today, because of the artillery, could not be employed, because that space that existed between one and the other army, gives them time to fire, which is most pernicious. as we said above. This method, therefore, must be set aside, and be used, as was said a short time ago, when all the Army is engaged, and the weaker part made to yield. When a Captain finds himself to have an army larger than that of the enemy, and not wanting to be prevented from surrounding him, arranges his Army with fronts equal to those of the enemy: then when the battle is started, has his front retire and the flanks extend little by little, and it will always happen that the enemy will find himself surrounded without being aware of it. When a Captain wants to fight almost secure in not being routed, he arranges his army in a place where he has a safe refuge nearby, either amid swamps or mountains or in a powerful city; for, in this manner, he cannot be pursued by the enemy, but the enemy cannot be pursued by him. This means was employed by Hannibal when fortune began to become adverse for him, and he was apprehensive of the valor of Marcus Marcellus. Several, in order to disorganise the ranks of the enemy, have commanded those who are lightly armed, that they begin the fight, and having begun it, retire among the ranks; and when the Armies afterwards have joined fronts together, and each front is occupied in fighting, they have allowed them to issue forth from the flanks of the companies, and disorganised and routed them. If anyone finds himself inferior in cavalry, he can, in addition to the methods mentioned, place a company of pikemen behind his cavalry, and in the fighting, arrange for them to give way for the pikemen, and he will always remain superior. Many have accustomed some of the lightly armed infantry to get used to combat amidst the cavalry, and this has been a very great help to the cavalry. Of all those who have organised Armies for battle, the most praiseworthy have been Hannibal and Scipio when they were fighting in Africa: and as Hannibal had his Army composed of Carthaginians and auxiliaries of various kinds, he placed eighty Elephants in the first van, then placed the auxiliaries, after these he placed his Carthaginians, and in the rear, he placed the Italians, whom he trusted little. He arranged matters thusly, because the auxiliaries, having the enemy in front and their rear closed by his men, they could not flee: so that being compelled to fight, they should overcome or tire out the Romans, thinking afterwards with his forces of virtu, fresh, he could easily overcome the already tired Romans. In the encounter with this arrangement, Scipio placed the Astati, the Principi, and the Triari, in the accustomed fashion for one to be able to receive the other, and one to help the other. He made the vans of the army full of intervals; and so that they should not be seen through, but rather appear united, he filled them with Veliti, whom he commanded that, as soon as the Elephants arrived, they should give way, and enter through the regular spaces among the legions, and leave the way open to the Elephants: and thus come to render their attack vain, so that coming hand to hand with them, he was superior.

ZANOBI: You have made me remember in telling me of this engagement, that Scipio, during the fight, did not have the Astati retire into the ranks of the Principi, but divided them and had them retire into the wings of the army, so as to make room for the Principi, if he wanted to push them forward. I would desire, therefore, that you tell me what reason motivated him not to observe the accustomed arrangement.

FABRIZIO: I will tell you. Hannibal had placed all the virtu of his army in the second line; whence Scipio, in order to oppose a similar virtu to it, assembled the Principi and the Triari; so that the intervals of the Principi being occupied by the Triari, there was no place to receive the Astati, and therefore, he caused the Astati to be divided and enter the wings of the army, and did not bring them among the Principi. But take note that this method of opening up the first lines to make a place for the second, cannot be employed except when the other are superior, because then the convenience exists to be able to do it, as Scipio was able to. But being inferior and repulsed, it cannot be done except with your manifest ruin: and, therefore, you must have ranks in the rear which will receive you. But let us return to our discussion. The ancient Asiatics [among other things thought up by them to injure the enemy] used chariots which had scythes on their sides, so that they not only served to open up the lines with their attack, but also kill the adversary with the scythes. Provisions against these attacks were made in three ways. It was resisted by the density of the ranks, or they were received within the lines as were the Elephants, or a stalwart resistance was made with some stratagems, as did Sulla, the Roman, against Archelaus, who had many of those chariots which they called Falcati; he (Sulla), in order to resist them, fixed many poles in the ground behind the first ranks, by which the chariots, being resisted, lost their impetus. And note is to be taken of the new method which Sulla used against this man in arranging the army, since he put the Veliti and the cavalry in the rear, and all the heavily armed in front, leaving many intervals in order to be able to send those in the rear forward if necessity should require it; whence when the battle was started, with the aid of the cavalry, to whom he gave the way, he obtained the victory. To want to worry the enemy during the battle, something must be made to happen which dismays him, either by announcing new help which is arriving, or by showing things which look like it, so that the enemy, being deceived by that sight, becomes frightened; and when he is frightened, can be easily overcome. These methods were used by the Roman Consuls Minucius Rufus and Accilius Glabrius. Caius Sulpicius also placed many soldier-packs on mules and other animals useless in war, but in a manner that they looked like men-at-arms, and commanded that they appear on a hill while they were (in) hand to hand (combat) with the Gauls: whence his victory resulted. Marius did the same when he was fighting against the Germans. Feigned assaults, therefore, being of great value while the battle lasts, it happens that many are benefited by the real (assaults), especially if, improvised in the middle of the battle, it is able to attack the enemy from behind or on the sides. Which can be done only with difficulty, unless the (nature of the) country helps you; for if it is open, part of your forces cannot be speeded, as must be done in such enterprises: but in wooded or mountainous places, and hence capable of ambush, part of your forces can be well hidden, so that the enemy may be assaulted, suddenly and without his expecting it, which will always be the cause of giving you the victory. And sometimes it has been very important, while the battle goes on, to plant voices which announce the killed of the enemy Captain, or to have defeated some other part of the army; and this often has given the victory to whoever used it. The enemy cavalry may be easily disturbed by unusual forms (sights) or noises; as did Croesus, who opposed camels to the cavalry of his adversaries, and Pyrrhus who opposed elephants to the Roman cavalry, the sight of which disturbed and disorganised it. In our times, the Turk routed the Shah in Persia and the Soldan in Syria with nothing else than the noise of guns, which so affected their cavalry by their unaccustomed noises, that the Turk was able easily to defeat it. The Spaniards, to overcome the army of Hamilcar, placed in their first lines chariots full of tow drawn by oxen, and when they had come to battle, set fire to them, whence the oxen, wanting to flee the fire, hurled themselves on the army of Hamilcar and dispersed it. As we mentioned, where the country is suitable, it is usual to deceive the enemy when in combat by drawing him into ambushes: but when it is open and spacious, many have employed the making (digging) of ditches, and then covering them lightly with earth and branches, but leaving several places (spaces) solid in order to be able to retire between them; then when the battle is started, retire through them, and the enemy pursuing, comes to ruin in them. If, during the battle, some accident befalls you which dismays your soldiers, it is a most prudent thing to know how to dissimulate and divert them to (something) good, as did Lucius Sulla, who, while the fighting was going on, seeing that a great part of his forces had gone over to the side of the enemy, and that this had dismayed his men, quickly caused it to be understood throughout the entire army that everything was happening by his order, and this not only did not disturb the army, but so increased its courage that it was victorious. It also happened to Sulla, that having sent certain soldiers to undertake certain business, and they having been killed, in order that his army would not be dismayed said, that because he had found them unfaithful, he had cunningly sent them

into the hands of the enemy. Sertorious, when undertaking an engagement in Spain, killed one who had pointed out to him the slaving of one of his Heads, for fear that by telling the same to the others, he should dismay them. It is a difficult matter to stop an army already in flight, and return it to battle. And you have to make this distinction: either they are entirely in flight (motion), and here it is impossible to return them: or only a part are in flight, and here there is some remedy. Many Roman Captains, by getting in front of those fleeing, have stopped them, by making them ashamed of their flight, as did Lucius Sulla, who, when a part of his Legions had already turned, driven by the forces of Mithradates, with his sword in hand he got in front of them and shouted, "if anyone asks you where you have left your Captain, tell them, we have left him in Boetia fighting." The Consul Attilius opposed those who fled with those who did not flee, and made them understand that if they did not turn about, they would be killed by both friends and enemies. Phillip of Macedonia, when he learned that his men were afraid of the Scythian soldiers, put some of his most trusted cavalry behind his army, and commissioned them to kill anyone who fled; whence his men, preferring to die fighting rather than in flight, won. Many Romans, not so much in order to stop a flight, as to give his men an occasion to exhibit greater prowess, while they were fighting, have taken a banner out of their hands, and tossing it amid the enemy, offered rewards to whoever would recover it.

I do not believe it is out of order to add to this discussion those things that happen after a battle, especially as they are brief, and not to be omitted, and conform greatly to this discussion. I will tell you, therefore, how engagements are lost, or are won. When one wins, he ought to follow up the victory with all speed, and imitate Caesar in this case, and not Hannibal, who, because he had stopped after he had defeated the Romans at Cannae, lost the Empire of Rome. The other (Caesar) never rested after a victory, but pursued the routed enemy with great impetus and fury, until he had completely assaulted it. But when one loses, a Captain ought to see if something useful to him can result from this loss, especially if some residue of the army remains to him. An opportunity can arise from the unawareness of the enemy, which frequently becomes obscured after a victory, and gives you the occasion to attack him; as Martius, the Roman, attacked the Carthaginian army, which, having killed the two Scipios and defeated their armies, thought little of that remnant of the forces who, with Martius, remained alive; and was (in turn) attacked and routed by him. It is seen, therefore, that there is nothing so capable of success as that which the enemy believes vou cannot attempt, because men are often injured more when they are less apprehensive. A Captain ought, therefore, when he cannot do this, at least endeavor with industry to restrict the injury caused by the defeat. And to do this, it is necessary for you to take steps that the enemy is not able to follow you easily, or give him cause for delay. In the first case some, after they realize they are losing, order their Leaders to flee in several parts by different paths, having (first) given an order where they should afterward reassemble, so that the enemy, fearing to divide his forces, would leave all or a greater part of them safe. In the second case, many have thrown down their most precious possessions in front of the enemy, so that being retarded by plundering, he gave them more time for flight. Titus Dimius used not a little astuteness in hiding the injury received in battle; for, after he had fought until nightfall with a loss of many of his men, caused a good many of them to be buried during the night; whence in the morning, the enemy seeing so many of their dead and so few Romans, believing they had had the disadvantage, fled. I believe I have thus confused you, as I said, (but) satisfied your question in good part: it is true, that concerning the shape of the army, there remains for me to tell you how sometimes it is customary for some Captains to make the front in the form of a wedge, judging in that way to be able more readily to open (penetrate) the Army of the enemy. In opposition to this shape they customarily would use a form of a scissor, so as to be able to receive that wedge into that space, and surround and fight it from every side. On this, I would like you to have this general rule, that the greatest remedy used against the design of the enemy, is to do that willingly which he designs for you to do by force, because doing it willingly you do it with order and to your advantage, but to his disadvantage: if you should do it by force, it would be to your ruin. As to the fortifying of this. I would not care to repeat anything already said. Does the adversary make a wedge in order to open your ranks? if you proceed with yours open, you disorganise him, and he does not disorganise you. Hannibal placed Elephants in front of his Army to open that of the Army of Scipio; Scipio went with his open and was the cause of his own victory and the ruin of the former (Hannibal). Hasdrubal placed his most stalwart forces in the center of the van of his Army to push back the forces of Scipio: Scipio commanded in like fashion that they should retire, and defeated him. So that such plans, when they are put forward, are the cause for the victory of him against whom they were organised. It remains for me yet, if I remember well, to tell you what considerations a Captain

ought to take into account before going into battle: upon which I have to tell you first that a Captain never has to make an engagement, if he does not have the advantage, or if he is not compelled to. Advantages arise from the location, from the organisation, and from having either greater or better forces. Necessity, (compulsion) arises when you see that, by not fighting, you must lose in an event: for example, when you see you are about to lack money, and therefore your Army has to be dissolved in any case; when hunger is about to assail you. or when you expect the enemy to be reinforced again by new forces. In these cases, one ought always to fight, even at your disadvantage; for it is much better to try your fortune when it can favor you, than by not trying, see your ruin sure: and in such a case, it is as serious an error for a Captain not to fight, as it is to pass up an opportunity to win, either from ignorance, or from cowardice. The enemy sometimes gives you the advantage, and sometimes (it derives from) your prudence. Many have been routed while crossing a river by an alert enemy of theirs, who waited until they were in the middle of the stream, and then assaulted them on every side; as Caesar did to the Swiss, where he destroyed a fourth part of them. after they had been split by the river. Some time you may find your enemy tired from having pursued you too inconsiderately, so that, finding yourself fresh, and rested, you ought not to lose such an opportunity. In addition to this, if an enemy offers you battle at a good hour of the morning, you can delay going out of your encampment for many hours: and if he has been under arms for a long time, and has lost that first ardor with which he started, you can then fight with him. Scipio and Metellus employed this method in Spain, the first against Hasdrubal, and the other against Sertorius. If the enemy has diminished in strength, either from having divided the Armies, as the Scipios (did) in Spain, or from some other cause, you ought to try (your) fortune. The greater part of prudent Captains would rather receive the onrush of the enemy, who impetuously go to assault them, for their fury is easily withstood by firm and resolute men, and that fury which was withstood, easily converts itself into cowardice. Fabius acted thusly against the Samnites and against the Gauls, and was victorious, but his colleague, Decius was killed. Some who feared the virtu of their enemy, have begun the battle at an hour near nightfall, so that if their men were defeated, they might be able to be protected by its darkness and save themselves. Some, having known that the enemy Army, because of certain superstitions, does not want to undertake fighting at such a time, selected that time for battle, and won: which Caesar did in Gaul against Ariovistus, and Vespatianus in Svria against the Jews. The greater and more important awareness that a Captain ought to have, is (to see) that he has about him, men loyal and most expert in war, and prudent, with whom he counsels continually, and discusses his forces and those of the enemy with them: which are the greater in number, which are better armed or better trained, which are more apt to suffer deprivation, which to confide in more, the infantry or the cavalry. Also, they consider the location in which they are, and if it is more suitable for the enemy than for themselves; which of them has the better convenience of supply; whether it is better to delay the engagement or undertake it, and what benefit the weather might give you or take away from them; for often when the soldiers see the war becoming long, they become irritable, and weary from hard work and tedium, will abandon you. Above all, it is important for the Captain to know the enemy, and who he has around him: if he is foolhardy or cautious: if timid or audacious. See whether you can trust the auxiliary soldiers. And above all, you ought to guard against leading an army into battle which is afraid, or distrustful in any way of victory. for the best indication of defeat is when one believes he cannot win. And, therefore, in this case, you ought to avoid an engagement, either by doing as Fabius Maximus did, who, by encamping in strong places, did not give Hannibal courage to go and meet him, or by believing that the enemy, also in strong places, should come to meet you, you should depart from the field, and divide your forces among your towns, so that the tedium of capturing them will tire him.

ZANOBI: Can he not avoid the engagement in other ways than by dividing it (the army) into several parts, and putting them in towns?

FABRIZIO: I believe at another time I have discussed with some of you that whoever is in the field, cannot avoid an engagement if he has an enemy who wants to fight in any case; and he has but one remedy, and that is to place himself with his Army at least fifty miles distant from his adversary, so as to be in time to get out of his way if he should come to meet him. And Fabius Maximus never avoided an engagement with Hannibal, but wanted it at his advantage; and Hannibal did not presume to be able to overcome him by going to meet him in the places where he was encamped. But if he supposed he could defeat him, it was necessary for Fabius to undertake an engagement with him in any case, or to flee. Phillip, King of Macedonia, he who was the father of Perseus, coming to war with the Romans, placed his encampment on a very high mountain so as not to have an engagement with them; but the Romans went to meet him on that mountain, and routed him.

Vercingetorix, a Captain of the Gauls, in order to avoid an engagement with Caesar, who unexpectedly had crossed the river, placed himself miles distant with his forces. The Venetians in our times, if they did not want to come to an engagement with the King of France, ought not to have waited until the French Army had crossed the Adda, but should have placed themselves distant from him, as did Vercingetorix: whence, having waited for him, they did not know how to take the opportunity of undertaking an engagement during the crossing, nor how to avoid it; for the French being near to them, as the Venetians decamped, assaulted and routed them. And so it is, that an engagement cannot be avoided if the enemy at all events wants to undertake it. Nor does anyone cite Fabius, for he avoided an engagement in cases like that, just as much as did Hannibal. It often happens that your soldiers are not willing to fight, and you know that because of their number or the location, or from some other cause, you have a disadvantage, and would like them to change their minds. It also happens that necessity or opportunity constrains you to (come to) an engagement, and that your soldiers are discontent and little disposed to fight, whence it is necessary for you in one case to frighten them, and in the other to excite them. In the first instance, if persuasion is not enough, there is no better way to have both those who fight and those who would not believe you, than to give some of them over to the enemy as plunder. It may also be well to do with cunning that which happened to Fabius Maximus at home. The Army of Fabius desired [as you know] to fight with the Army of Hannibal: his Master of cavalry had the same desire. It did not seem proper to Fabius to attempt the battle, so that in order to dispel such (desires), he had to divide the Army. Fabius kept his men in the encampments: and the other (the Master of cavalry) going forth, and coming into great danger, would have been routed, if Fabius had not succored him. By this example, the Master of the cavalry, together with the entire army, realized it was a wise course to obey Fabius. As to exciting them to fight, it is well to make them angry at the enemy, by pointing out that (the enemy) say slanderous things of them, and showing them to have with their intelligence (in the enemy camp) and having corrupted some part, to encamp on the side where they see they enemy, and undertake some light skirmishes with them: because things that are seen daily are more easily disparaged. By showing yourself indignant, and by making an oration in which you reproach them for their laziness, you make them so ashamed by saying you want to fight only if they do not accompany you. And above every thing, to have this awareness if you want to make the soldiers obstinate in battle not to permit them to send home any of their possessions, or settle in any place, until the war ends, so that they understand that if flight saves them their lives, it will not save them their possessions, the love of the latter, not less than the former, renders men obstinate in defense.

ZANOBI: You have told how soldiers can be made to turn and fight, by talking to them. Do you mean by this that he has to talk to the entire Army, or to its Heads?

FABRIZIO: To persuade or dissuade a few from something, is very easy; for if words are not enough, you can use authority and force: but the difficulty is to take away a sinister idea from a multitude, whether it may be in agreement or contrary to your own opinion, where only words can be used, which, if you want to persuade everyone, must be heard by everyone. Captains, therefore, must be excellent Orators, for without knowing how to talk to the entire Army, good things can only be done with difficulty. Which, in these times of ours, is completely done away with. Read the life (biography) of Alexander the Great, and see how many times it was necessary to harangue and speak publicly to the Army; otherwise he could never have them led them [having become rich and full of plunder] through the deserts of Arabia and into India with so much hardship and trouble; for infinite numbers of things arose by which an Army is ruined if a Captain does not know how or is not accustomed to talking to it; for this speaking takes away fear, incites courage, increases obstinacy, and sweeps away deceptions, promises rewards, points out dangers and the ways to avoid them. reprimands, begs, threatens, fills with hope, praises, slanders, and does all those things by which human passion are extinguished or enkindled. Whence that Prince or Republic planning to raise a new army, and to give this army reputation, ought to accustom the soldiers to listen to the talk of the Captain, and the Captain to know how to talk to them. Religion was (also) of much value in keeping the ancient soldiers well disposed and an oath was given to (taken by) them when they came into the army; for whenever they made a mistake, they were threatened not only by those evils that can be feared by men, but also by those that can be expected from the Deity. This practice, mixed with other religious means. often made an entire enterprise easy for the ancient Captains. and would always be so whenever religion was feared and observed. Sertorius availed himself of this when he told of talking with a Hind (female stag), which promised him victory on the part of the Deity. Sulla was said to talk with a Statue which he had taken from the Temple of Apollo. Many have told of God appearing to them in their sleep, and admonishing them to fight. In the times of our fathers. Charles the seventh, King of France, in the war he waged against the English, was said to counsel with a young girl sent by God, who is called the Maid of France, and who was the cause for victory. You can also take means to make your (soldiers) value the enemy little, as Agesilaus the Spartan did. who showed his soldiers some Persians in the nude, so that seeing their delicate members, they should have no cause for being afraid of them. Some have constrained them to fight from necessity, by removing from their paths all hope of saving themselves, except through victory. This is the strongest and the best provision that can be made when you want to make your soldiers obstinate. Which obstinacy is increased by the confidence and the love either of the Captain or of the Country. Confidence is instilled by arms organisation, fresh victories, and the knowledge of the Captain. Love of Country springs from nature: that of the Captain from (his) virtu more than any other good event. Necessities can be many, but that is the strongest, which constrains you either to win or to die

MACHIAVELLI ART OF WAR, 5TH BOOK

FABRIZIO: I have shown you how to organise an army to battle another army which is seen posted against you, and I have told you how it is overcome, and also of the many circumstances which can occur because of the various incidents surrounding it, so that it appears to me now to be the time to show you how to organise an army against an enemy which is unseen, but which you are continually afraid will assault you. This happens when marching through country which is hostile, or suspected (of being so). And first you have to understand that a Roman Army ordinarily always sent ahead some groups of cavalry as observers for the march. Afterwards the right wing followed. After this came all the wagons which pertained to it. After those, another Legion, and next its wagons. After these come the left wing with its wagon in the rear, and the remainder of the cavalry followed in the last part. This was in effect the manner in which one ordinarily marched. And if it happened that the Army should be assaulted on the march in front or from the rear, they quickly caused all the wagons to be withdrawn either on the right, or on the left, according as it happened, or rather as best they could depending on the location, and all the forces together, free from their baggage, set up a front on that side from which the enemy was coming. If they were assaulted on the flank, they would withdraw the wagons to the side which was secure, and set up a front on the other. This method being good, and prudently conducted, appears to me ought to be imitated, sending cavalry ahead to observe the country, then having four battalions, having them march in line, and each with its wagons in the rear. And as the wagons are of two kinds, that is, those pertaining to individual soldiers, and the public ones for use by the whole camp, I would divide the public wagons into four parts, and assign a part to each Battalion, also dividing the artillery and all the unarmed men, so that each one of those armed should have its equal share of impedimenta. But as it sometimes happens that one marches in a country not only suspect, but hostile in fact, that you are afraid of being attacked hourly, in order to go on more securely, you are compelled to change the formation of the march, and go on in the regular way, so that in some unforeseen place, neither the inhabitants nor the Army can injure you. In such a case, the ancient Captains usually went on with the Army in squares, for such they called these formations, not because it was entirely square, but because it was capable of fighting on four sides, and they said that they were going prepared either for marching or for battle. I do not want to stray far from this method, and want to arrange my two Battalions, which I have taken as a rule for an Army, in this manner. If you want, therefore, to walk securely through the enemy country, and be able to respond from every side, if you had been assaulted by surprise, and wanting, in accordance with the ancients, to bring it into a square, I would plan to make a square whose hollow was two hundred arm lengths on every side in this manner. I would first place the flanks, each distant from the other by two hundred twelve arm lengths, and would place five companies in each flank in a file along its length, and distant from each other three arm lengths; these would occupy their own space, each company occupying (a space) forty arm lengths by two hundred twelve arm lengths. Between the front and rear of these two flanks. I would place another ten companies, five on each side, arranging them in such a way that four should be next to the front of the right flank, and five at the rear of the left flank, leaving between each one an interval (gap) of four arm lengths: one of which should be next to the front of the left flank, and one at the rear of the right flank. And as the space existing between the one flank and the other is two hundred twelve arm lengths, and these companies placed alongside each other by their width and not length, they would come to occupy, with the intervals, one hundred thirty four arm lengths, (and) there would be between the four companies placed on the front of the right flank, and one placed on the left, a

remaining space of seventy eight arm lengths, and a similar space be left among the companies placed in the rear parts; and there would be no other difference, except that one space would be on the rear side toward the right wing, the other would be on the front side toward the left wing. In the space of seventy eight arm lengths in front, I would place all the ordinary Veliti, and in that in the rear the extraordinary Veliti, who would come to be a thousand per space. And if you want that the space taken up by the Army should be two hundred twelve arm lengths on every side, I would see that five companies are placed in front, and those that are placed in the rear, should not occupy any space already occupied by the flanks, and therefore I would see that the five companies in the rear should have their front touch the rear of their flanks, and those in front should have their rear touch the front (of their flanks), so that on every side of that army, space would remain to receive another company. And as there are four spaces, I would take four banners away from the extraordinary pikemen and would put one on every corner: and the two banners of the aforementioned pikemen left to me, I would place in the middle of the hollow of their army (formed) in a square of companies, at the heads of which the general Captain would remain with his men around him. And as these companies so arranged all march in one direction, but not all fight in one, in putting them together, one has to arrange which sides are not guarded by other companies during the battle. And, therefore, it ought to be considered that the five companies in front protect all the other sides, except the front; and therefore these have to be assembled in an orderly manner (and) with the pikemen in front. The five companies behind protect all the sides, except the side in the back; and therefore ought to be assembled so that the pikemen are in the rear, as we will demonstrate in its place. The five companies on the right flank protect all the sides, from the right flank outward. The five on the left, engird all the sides, from the left flank outward: and therefore in arranging the companies, the pikemen ought to be placed so that they turn by that flank which in uncovered. And as the Heads of Ten are placed in the front and rear, so that when they have to fight, all the army and its members are in their proper places, the manner of accomplishing this was told when we discussed the methods of arranging the companies. I would divide the artillery, and one part I would place outside the right flank, and the other at the left. I would send the light cavalry ahead to reconnoiter the country. Of the men-at-arms, I would place part in the rear on the right wing, and part on the left, distant forty arms lengths from the companies. And no matter how you arrange your Army, you have to take up [as the cavalry] this general (rule), that you have to place them always either in the rear or on the flanks. Whoever places them ahead in front of the Army must do one of two things: either he places them so far ahead, that if they are repulsed they have so much room to give them time to be able to obtain shelter for themselves from your infantry and not collide with them; or to arrange them (the infantry) with so many intervals, that by means of them the cavalry can enter among them without disorganising them. Let not anyone think little of this instruction, because many, not being aware of this, have been ruined, and have been disorganised and routed by themselves. The wagons and the unarmed men are placed in the plaza that exists within the Army, and so compartmented, that they easily make way for whoever wants to go from one side to the other, or from one front of the Army to the other. These companies, without artillery and cavalry, occupy two hundred eighty two arm lengths of space on the outside in every direction. And as this square is composed of two Battalions, it must be devised as to which part one Battalion makes up, and which part the other. And since the Battalions are called by number, and each of them has [as you know] ten companies and a general Head, I would have the first Battalion place its first five companies in the front, the other five on the left flank, and the Head should be in the left angle of the front. The first five companies of the second Battalion then should be placed on the right flank, and the other five in the rear, and the Head should be in the right angle, who would undertake the office of the Tergiduttore.

The Army organised in this manner is ready to move, and in its movement should completely observe this arrangement: and without doubt it is secure from all the tumults of the inhabitants. Nor ought the Captain make other provisions against these tumultuous assaults, than sometime to give a commission to some cavalry or band of Veliti to put them in their place. Nor will it ever happen that these tumultuous people will come to meet you within the drawing of a sword or pike, because disorderly people are afraid of order; and it will always be seen that they make a great assault with shouts and noises without otherwise approaching you in the way of yelping dogs around a mastiff. Hannibal, when he came to harm from the Romans in Italy, passed through all of France, and always took little account of the tumults of the French When you want to march, you must have levellers and men with pick axes ahead who clear the road for you, and who are well protected by that cavalry sent ahead to reconnoiter. An Army will march in this order ten miles a day, and enough Sun (light will remain for them to dine and camp, since

ordinarily an Army marches twenty miles. If it happens that it is assaulted by an organised Army, this assault cannot arise suddenly, because an organised Army travels at its own rate (step), so that you are always in time to reorganise for the engagement, and quickly bring yourself to that formation, or similar to that formation of the Army, which I showed you above. For if you are assaulted on the front side, you do nothing except (to have) the artillery in the flanks and the cavalry behind come forward and take those places and with those distances mentioned above. The thousand Veliti who are forward, come forth from their positions, and dividing into groups of a hundred, enter into their places between the cavalry and the wings of the Army. Then, into the voids left by them, enter the two bands of extraordinary pikemen which I had placed in the plaza of the Army. The thousand Veliti that I had placed in the rear depart from there, and distribute themselves among the flanks of the companies to strengthen them: and from the open space they leave all the wagons and unarmed men issue forth and place themselves at the rear of the companies. The plaza, therefore, remains vacant as everyone has gone to their places, and the five companies that I placed in the rear of the Army come forward through the open void that exists between the one and the other flank, and march toward the company in the front, and the three approach them at forty arm lengths with equal intervals between one another, and two remain behind distant another forty arm lengths. This formation can be organised quickly. and comes to be almost the same as the first disposition of the Army which we described before: and if it becomes more straitened in the front, it becomes larger in the flanks, which does not weaken it. But as the five companies in the back have their pikemen in the rear for the reasons mentioned above, it is necessary to have them come from the forward part, if you want them to get behind the front of the Army; and, therefore, one must either make them turn company by company, as a solid body, or make them enter quickly between the ranks of the shield-bearers (swordsmen), and bring them forward; which method is more swift and less disorderly than to make them turn. And thus you ought to do with all those who are in the rear in every kind of assault, as I will show you. If it should happen that the enemy comes from the rear, the first thing that ought to be done is to have everyone turn to face the enemy, so that at once the front of the army becomes the rear, and the rear the front. Then all those methods of organising the front should be followed, which I mentioned above. If the enemy attacks on the right flank, the entire army ought to be made to face in that direction, and then those things ought to be done to strengthen that (new) front which were mentioned above, so that the cavalry, the Veliti, and the artillery are in the position assigned in this front. There is only this difference, that in the changing of fronts, of those who move about, some have to go further, and some less. It is indeed true that when a front is made of the right flank, the Veliti would have to enter the intervals (gaps) that exist between the wings of the Army, and the cavalry would be those nearer to the left flank, in the position of those who would have to enter into the two bands of extraordinary pikemen placed in the center. But before they enter, the wagons and unarmed men stationed at the openings, should clear the plaza and retire behind the left flank, which then becomes the rear of the army. And the other Veliti who should be placed in the rear according to the original arrangement, in this case should not be changed, as that place should not remain open, which, from being the rear, would become a flank. All the other things ought to be done as was said concerning the first front.

What has been said concerning making a front from the right flank, is intended also in making one from the left flank, since the same arrangements ought to be observed. If the enemy should happen to be large and organised to assault you on two sides, the two sides on which he assaults you ought to be strengthened from the two that are not assaulted, doubling the ranks in each one, and distributing the artillery, Veliti, and cavalry among each side. If he comes from three or four sides, it needs must be either you or he lacks prudence, for if vou were wise, vou would never put vourself on the side where the enemy could assault you from three or four sides with large and organised forces, and if he wanted to attach you in safety he must be so large and assault you on each side with a force almost as large as you have in your entire Army. And if you are so little prudent that you put yourself in the midst of the territory and forces of an enemy, who has three times the organised forces that you have, you cannot complain if evil happens to you, except of yourself. If it happens, not by your fault, but by some misadventure, the injury will be without shame, and it will happen to you as it did to the Scipios in Spain, and the Hasdrubal in Italy. But if the enemy has a much larger force than you, and in order to disorganise you wants to assault you on several sides, it will be his foolishness and his gamble; for to do this, he must go (spread) himself thin, that you can always attack on one side and resist on another, and in a brief time ruin him. This method of organising an Army which is not seen, but who is feared, is necessary, and it is a most useful thing to accustom your

soldiers to assemble, and march in such order, and in marching arrange themselves to fight according to the first front (planned), and then return to marching formation, from that make a front from the rear, and then from the flank, and from that return to the original formation. These exercises and accustomization are necessary matters if you want a disciplined and trained Army. Captains and Princes have to work hard at these things: nor is military discipline anything else, than to know how to command and how to execute these things, nor is a disciplined Army anything else, than an army which is well trained in these arrangements; nor would it be possible for anyone in these times who should well employ such discipline ever to be routed. And if this square formation which I have described is somewhat difficult, such difficulty is necessary, if you take it up as exercise; since knowing how to organise and maintain oneself well in this, one would afterwards know how to manage more easily those which not be as difficult

ZANOBI: I believe as you say, that these arrangements are very necessary, and by myself, I would not know what to add or leave out. It is true that I desire to know two things from you: the one, when you want to make a front from the rear or from a flank, and you want them to turn, whether the command is given by voice or by sound (bugle call): the other, whether those you sent ahead to clear the roads in order to make a path for the Army, ought to be soldiers of your companies, or other lowly people assigned to such practices.

FABRIZIO: Your first question is very important, for often the commands of the Captain are not very well understood or poorly interpreted, have disorganised their Army; hence the voices with which they command in (times of) danger, ought to be loud and clear. And if you command with sounds (bugle calls), it ought to be done so that they are so different from each other that one cannot be mistaken for another; and if you command by voice, you ought to be alert to avoid general words, and use particular ones, and of the particular ones avoid those which might be able to be interpreted in an incorrect manner. Many times saying "go back, go back", has caused an Army to be ruined: therefore this expression ought to be avoided, and in its place use "Retreat". If you want them to turn so as to change the front, either from the rear or from the flank, never use "Turn around", but say, "To the left", "To the right", "To the rear", "To the front". So too, all the other words have to be simple and clear, as "Hurry", "Hold still", "Forward", "Return". And all those things which can be done by words are done, the others are done by sounds (calls). As to the (road) clearers, which is your second question. I would have this job done by my own soldiers, as much because the ancient military did so, as also because there would be fewer unarmed men and less impediments in the army: and I would draw the number needed from every company, and I would have them take up the tools suitable for clearing, and leave their arms in those ranks that are closest to them, which would carry them so that if the enemy should come, they would have nothing to do but take them up again and return to their ranks.

ZANOBI: Who would carry the clearing equipment?

FABRIZIO: The wagons assigned to carry such equipment. ZANOBI: I'm afraid you have never led these soldiersof ours to dig.

FABRIZIO: Everything will be discussed in its place. For now I want to leave these parts alone, and discuss the manner of living of the Army, for it appears to me that having worked them so hard, it is time to refresh and restore it with food. You have to understand that a Prince ought to organise his army as expeditiously as possible, and take away from it all those things that add burdens to it and make the enterprise difficult. Among those that cause more difficulty, are to have to keep the army provided with wine and baked bread. The ancients did not think of wine, for lacking it, they drank water tinted with a little vinegar, and not wine. They did not cook bread in ovens, as is customary throughout the cities; but they provided flour, and every soldier satisfied himself of that in his own way, having lard and grease for condiment, which gave flavor to the bread they made, and which kept them strong. So that the provisions of living (eating) for the army were Flour, Vinegar, Lard (Bacon) and Grease (Lard), and Barley for the horses. Ordinarily, they had herds of large and small beasts that followed the Army, which [as they did not need to be carried] did not impede them much. This arrangement permitted an ancient Army to march, sometimes for many days, through solitary and difficult places without suffering hardship of (lack of) provisions, for it lived from things which could be drawn behind. The contrary happens in modern Armies, which, as they do not want to lack wine and eat baked bread in the manner that those at home do, and of which they cannot make provision for long, often are hungry; or even if they are provided, it is done with hardship and at very great expense. I would therefore return my Army to this form of living, and I would not have them eat other bread than that which they should cook for themselves. As to wine, I would not prohibit its drinking, or that it should come into the army, but I would not use either industry or any hard work to obtain it, and as to other provisions, I would govern myself entirely as the ancients. If you would consider this matter well, you will see how much difficulty is removed, and how many troubles and hardships an army and a Captain avoid, and what great advantage it will give any enterprise which you may want to undertake.

ZANOBI: We have overcome the enemy in the field, andthen marched on his country: reason wants that there be no booty, ransoming of towns, prisoners taken. Yet I would like to knowhow the ancients governed themselves in these matters.

FABRIZIO: Here, I will satisfy you. I believe you have considered [since I have at another time discussed this with some of you] that modem wars impoverish as much those Lords who win, as those who lose; for if one loses the State, the other loses his money and (movable) possessions. Which anciently did not happen, as the winner of a war (then) was enriched. This arises from not keeping track in these times of the booty (acquired), as was done anciently, but everything is left to the direction of the soldiers. This method makes for two very great disorders: the one, that of which I have spoken: the other that a soldier becomes more desirous of booty and less an observer of orders; and it has often been said that the cupidity for booty has made him lose who had been victorious. The Romans, however, who were Princes in this matter, provided for both these inconveniences, ordering that all the booty belong to the public, and that hence the public should dispense it as it pleased. And so they had Quaestors in the Army, who were, as we would say, chamberlains, to whom all the ransoms and booty was given to hold; from which the Consul served himself to give the soldiers their regular pay, to help the wounded and infirm, and to provide for the other needs of the army. The Consul could indeed, and often did, concede a booty to the soldiers, but this concession did not cause disorders; for when the (enemy) army was routed, all the booty was placed in the middle and was distributed to each person, according to the merits of each. This method made for the soldiers attending to winning and not robbing, and the Roman legions defeating the enemy but not pursuing him: for they never departed from their orders: only the cavalry and lightly armed men pursued him, unless there were other soldiers than legionnaires, which, if the booty would have been kept by whoever acquired it, it was neither possible nor reasonable to (expect to) hold the Legion firm, and would bring on many dangers. From this it resulted, therefore that the public was enriched, and every Consul brought, with his triumphs, much treasure into the Treasury, which (consisted) entirely of ransoms and booty. Another thing well considered by the ancients, was the pay they gave to each soldier: they wanted a third part to be placed next to him who carried the flag of the company, who never was given any except that furnished by the war. They did this for two reasons: The first so that the soldier would make capital (save) of his pay: for the greater part of them being young and irresponsible, the more they had, the more they spent without need to. The other part because, knowing that their movable possessions were next to the flag, they would be forced to have greater care, and defend it with greater obstinacy: and thus this method made them savers, and strong. All of these things are necessary to observe if you want to bring the military up to your standards

ZANOBI: I believe it is not possible for an army while marching from place to place not to encounter dangerous incidents, (and) where the industry of the Captain and the virtu of the soldier is needed if they are to be avoided; therefore, if you should have something that occurs to you, I would take care to listen.

FABRIZIO: I will willingly content you, especially as it is necessary, if I want to give you complete knowledge of the practice. The Captains, while they march with the Army, ought, above everything else, to guard against ambushes, which may happen in two ways: either you enter into them while marching, or the enemy cunningly draws you into them without your being aware of it. In the first case, if you want to avoid them, it is necessary to send ahead double the guard, who reconnoiter the country. And the more the country is suitable for ambush, as are wooded and mountainous countries, the more diligence ought to be used, for the enemy always place themselves either in woods or behind a hill. And, just as by not foreseeing an ambush you will be ruined, so by foreseeing it you will not be harmed. Birds or dust have often discovered the enemy, for where the enemy comes to meet you, he will always raise a great dust which will point out his coming to you. Thus often a Captain when he sees in a place whence he ought to pass, pigeons taking off and other birds flying about freely, circling and not setting, has recognised this to be the place of any enemy ambush, and knowing this has sent his forces forward, saving himself and injuring the enemy. As to the second case, being drawn into it [which our men call being drawn into a trap] you ought to look out not to believe readily those things that appear to be less reasonable than they should be: as would be (the case) if an enemy places some booty before you, you would believe that it to be (an act of) love, but would conceal deceit inside it. If many enemies are driven out by few of your man: if only a few

of the enemy assault you: if the enemy takes to sudden and unreasonable flight: in such cases, you ought always to be afraid of deceit; and you should never believe that the enemy does not know his business, rather, if you want to deceive yourself less and bring on less danger, the more he appears weak, the more enemy appears more cautious, so much the more ought you to esteem (be wary) of him. And in this you have to use two different means, since you have to fear him with your thoughts and arrangements, but by words and other external demonstrations show him how much you disparage him; for this latter method causes your soldiers to have more hope in obtaining the victory, the former makes you more cautious and less apt to be deceived. And you have to understand that when you march through enemy country, you face more and greater dangers than in undertaking an engagement. And therefore, when marching, a Captain ought to double his diligence, and the first thing he ought to do, is to have all the country through which he marches described and depicted, so that he will know the places, the numbers, the distances, the roads, the mountains, the rivers, the marshes, and all their characteristics. And in getting to know this, in diverse ways one must have around him different people who know the places, and question them with diligence, and contrast their information, and make notes according as it checks out. He ought to send cavalry ahead, and with them prudent Heads, not so much to discover the enemy as to reconnoiter the country, to see whether it checks with the places and with the information received from them. He ought also to send out guides, guarded (kept loyal) by hopes of reward and fear of punishment. And above all, he ought to see to it that the Army does not know to which sides he guides them, since there is nothing more useful in war, than to keep silent (about) the things that have to be done. And so that a sudden assault does not disturb your soldiers, you ought to advise them to be prepared with their arms, since things that are foreseen cause less harm. Many have lin order to avoid the confusion of the march] placed the wagons and the unarmed men under the banners, and commanded them to follow them, so that having to stop or retire during the march, they are able to do so more easily: which I approve very much as something useful. He ought also to have an awareness during the march, that one part of the Army does not detach itself from another, or that one (part) going faster and the other more slowly, the Army does not become compacted (jumbled), which things cause disorganisation. It is necessary, therefore, to place the Heads along the sides, who should maintain the steps uniform, restraining those which are too fast, and hastening the slow; which step cannot be better regulated than by sound (music). The roads ought to be widened, so that at least one company can always move in order. The customs and characteristics of the enemy ought to be considered, and if he wants to assault you in the morning, noon, or night, and if he is more powerful in infantry or cavalry, from what you have learned, you may organise and prepare yourself. But let us come to some incident in particular. It sometimes happens that as you are taking yourself away from in front of the enemy because you judge yourself to be inferior (to him), and therefore do not want to come to an engagement with him, he comes upon your rear as you arrive at the banks of a river, which causes you to lose times in its crossing, so that the enemy is about to join up and combat with you. There have been some who have found themselves in such a peril, their army girded on the rear side by a ditch, and filling it with tow, have set it afire, then have passed on with the army without being able to be impeded by the enemy, he being stopped by that fire which was in between.

ZANOBI: And it is hard for me to believe that this fire can check him, especially as I remember to have heard that Hanno, the Carthaginian, when he was besieged by the enemy, girded himself on that side from which he wanted to make an eruption with wood, and set fire to it. Whence the enemy not being intent to guard that side, had his army pass over the flames, having each (soldier) protect his face from the fire and smoke with his shield.

FABRIZIO: You say well; but consider what I have said and what Hanno did: for I said that he dug a ditch and filled it with tow, so that whoever wanted to pass had to contend with the ditch and the fire. Hanno made the fire without a ditch, and as he wanted to pass through it did not make it very large (strong), since it would have impeded him even without the ditch. Do you not know that Nabidus, the Spartan, when he was besieged in Sparta by the Romans, set fire to part of his own town in order to stop the passage of the Romans, who had already entered inside? and by those flames not only stopped their passage, but pushed them out. But let us return to our subject. Quintus Luttatius, the Roman, having the Cimbri at his rear, and arriving at a river, so that the enemy should give him time to cross, made as if to give him time to combat him, and therefore feigned to make camp there, and had ditches dug, and some pavilions raised, and sent some horses to the camps to be shod: so that the Cimbri believing he was encamping, they also encamped, and divided themselves into several parts to provide themselves with food: of which Luttatius becoming aware, he crossed the river without being

able to be impeded by them. Some, in order to cross a river, not having a bridge, have diverted it, and having drawn a part of it in their rear, the other then became so low that they crossed it easily. If the rivers are rapid, (and) desiring that the infantry should cross more safely, the more capable horses are placed on the side above which holds back the water, and another part below which succor the infantry if any, in crossing, should be overcome by the river. Rivers that are not forded, are crossed by bridges, boats, and rafts; and it is therefore well to have skills in your Armies capable of doing all these things. It sometimes happens that in crossing a river, the enemy on the opposite bank impedes you. If you want to overcome this difficulty there is no better example known than that of Caesar, who, having his army on the bank of a river in Gaul, and his crossing being impeded by Vercingetorix, the Gaul, who had his forces on the other side of the river, marched for several days along the river, and the enemy did the same. And Caesar having made an encampment in a woody place (and) suitable to conceal his forces, withdrew three cohorts from every Legion, and had them stop in that place, commanding then that as soon as he should depart, they should throw a bridge across and fortify it, and he with the rest of his forces continued the march: Whence Vercingetorix seeing the number of Legions, and believing that no part had remained behind, also continued the march: but Caesar, as soon as he thought the bridge had been completed, turned back, and finding everything in order, crossed the river without difficulty.

ZANOBI: Do you have any rule for recognising the fords? FABRIZIO: Yes, we have. The river, in that part between the stagnant water and the current, always looks like a line to whoever looks at it, is shallower, and is a place more suitable for fording than elsewhere, for the river always places more material, and in a pack, which it draws (with it) from the bottom. Which thing, as it has been experienced many times, is very true.

ZANOBI: If it happens that the river has washed away the bottom of the ford, so that horses sink, what remedy do you have?

FABRIZIO: Make grids of wood, and place them on the bottom of the river, and cross over those. But let us pursue our discussion. If it happens that a Captain with his army is led (caught) between two mountains, and has but two ways of saving himself, either that in front, or the one in the rear, and both being occupied by the enemy, has, as a remedy, to do what some have done in the past, which is to dig a large ditch, difficult to cross, and show the enemy that by it you want to be able to hold him with all his forces, without having to fear those forces in the rear for which the road in front remains open. The enemy believing this, fortifies himself on the side open, and abandons the (side) closed, and he then throws a wooden bridge, planned for such a result, over the ditch, and without any impediment, passes on that side and freed himself from the hands of the enemy. Lucius Minutius, the Roman Consul, was in Liguria with the Armies. and had been enclosed between certain mountains by the enemy, from which he could not go out. He therefore sent some soldiers of Numidia, whom he had in his army, who were badly armed, and mounted on small and scrawny horses, toward those places which were guarded by the enemy, and the first sight of whom caused the enemy to assemble to defend the pass: but then when they saw those forces poorly organised, and also poorly mounted, they esteemed them little and loosened their guard. As soon as the Numidians saw this, giving spurs to their horses and attacking them, they passed by without the enemy being able to take any remedy; and having passed, they wasted and plundered the country, constraining the enemy to leave the pass free to the army of Lucius. Some Captain, who has found himself assaulted by a great multitude of the enemy, has tightened his ranks, and given the enemy the faculty of completely surrounding him, and then has applied force to that part which he has recognised as being weaker, and has made a path in that way, and saved himself. Marcantonio, while retiring before the army of the Parthians, became aware that every day at daybreak as he moved, the enemy assaulted him, and infested him throughout the march: so that he took the course of not departing before midday. So that the Parthians, believing he should not want to decamp that day returned to their quarters, and Marcantonio was able then for the remainder of the day to march without being molested. This same man, to escape the darts of the Parthians, commanded that, when the Parthians came toward them, they should kneel, and the second rank of the company should place their shields on the heads of (those in the) first, the third on (those of the) second, the fourth on the third, and so on successively: so that the entire Army came to be as under a roof, and protected from the darts of the enemy. This is as much as occurs to me to tell you of what can happen to an army when marching: therefore, if nothing else occurs to you, I will pass on to another part.

MACHIAVELLI ART OF WAR, 6TH BOOK

ZANOBI: I believe it is well, since the discussion ought to be changed, that Battista take up his office, and I resign mine;

and in this case we would come to imitate the good Captains, according as I have already learned here from the Lord, who place the best soldiers in the front and in the rear of the Army, as it appears necessary to them to have those who bravely enkindle the battle, and those in the rear who bravely sustain it. Cosimo, therefore, begun this discussion prudently, and Battista will prudently finish it. Luigi and I have come in between these. And as each one of us has taken up his part willingly, so too I believe Battista is about to close it. BATTISTA: I have allowed myself to be governed up to now, so too I will allow myself (to be governed) in the future. Be content, therefore, (my) Lords, to continue your discussions, and if we interrupt you with these questions (practices), you have to excuse us.

FABRIZIO: You do me, as I have already told you, a very great favor, since these interruptions of yours do not take away my imagination, rather they refresh it. But if we want to pursue our subject I say, that it is now time that we quarter this Army of ours, since you know that everything desires repose, and safety; since to repose oneself, and not to repose safely, is not complete (perfect) repose. I am afraid, indeed, that you should not desire that I should first quarter them, then had them march, and lastly to fight, and we have done the contrary. Necessity has led us to this, for in wanting to show when marching, how an army turns from a marching formation to that of battle, it was necessary first to show how they were organised for battle. But returning to our subject I say, that if you want the encampment to be safe, it must be Strong and Organised. The industry of the Captain makes it organised: Arts or the site make it Strong. The Greeks sought strong locations, and never took positions where there was neither grottoes (caves), or banks of rivers, or a multitude of trees, or other natural cover which should protect them. But the Romans did not encamp safely so much from the location as by arts, nor ever made an encampment in places where they should not have been able to spread out all their forces, according to their discipline. From this resulted that the Romans were always able to have one form of encampment, for they wanted the site to obey them, and not they the site. The Greeks were not able to observe this, for as they obeyed the site, and the sites changing the formation, it behooved them that they too should change the mode of encamping and the form of their encampment. The Romans, therefore, where the site lacked strength, supplied it with (their) art and industry. And since in this narration of mine, I have wanted that the Romans be imitated, I will not depart from their mode of encamping, not, however, observing all their arrangements: but taking (only) that part which at the present time seems appropriate to me. I have often told you that the Romans had two Legions of Roman men in their consular armies, which comprised some eleven thousand infantry of forces sent by friends (allies) to aid them; but they never had more foreign soldiers in their armies than Romans, except for cavalry, which they did not care if they exceeded the number in their Legions; and that in every action of theirs, they place the Legions in the center, and the Auxiliaries on the sides. Which method they observed even when they encamped, as you yourselves have been able to read in those who write of their affairs; and therefore I am not about to narrate in detail how they encamped, but will tell you only how I would at present arrange to encamp my army, and then you will know what part of the Roman methods I have treated. You know that at the encounter of two Roman Legions I have taken two Battalions of six thousand infantry and three hundred cavalry effective for each Battalion, and I have divided them by companies, by arms, and names. You know that in organising the army for marching and fighting, I have not made mention of other forces, but have only shown that in doubling the forces, nothing else had to be done but to double the orders (arrangements).

Since at present I want to show you the manner of encamping, it appears proper to me not to stay only with two Battalions, but to assemble a fair army, and composed like the Roman of two Battalions and as many auxiliary forces. I know that the form of an encampment is more perfect, when a complete army is guartered: which matter did not appear necessary to me in the previous demonstration. If I want, therefore, to quarter a fair (sized) army of twenty four thousand infantry and two thousand cavalry effectives, being divided into four companies, two of your own forces and two of foreigners, I would employ this method. When I had found the site where I should want to encamp. I would raise the Captain's flag, and around it I would draw a square which would have each face distant from it fifty arm lengths, of which each should look out on one of the four regions of the sky, that is, east, west, south and north, in which space I would put the quarters of the Captain. And as I believe it prudent, and because thus the Romans did in good part, I would divide the armed men from the unarmed and separate the men who carry burdens from the unburdened ones. I would quarter all or a greater part of the armed men on the east side, and the unarmed and burdened ones on the west side, making the east the front and the west the rear of the encampment, and the south and north would be the flanks.

And to distinguish the quarters of the armed men, I would employ this method. I would run a line from the Captain's flag, and would lead it easterly for a distance of six hundred eighty (680) arm lengths. I would also run two other lines which l would place in the middle of it, and be of the same length as the former, but distant from each of them by fifteen arm lengths, at the extremity of which. I would want the east gate to be (placed): and the space which exists between the two extreme (end) lines. I would make a road that would go from the gate to the quarters of the Captain, which would be thirty arm lengths in width and six hundred thirty (630) long [since the Captain's quarters would occupy fifty arm lengths] and call this the Captain's Way. I would then make another road from the south gate up to the north gate, and cross by the head of the Captain's Way, and along the east side of the Captain's quarters which would be one thousand two hundred fifty (1250) arm lengths long [since it would occupy the entire width of the encampment] and also be thirty arm lengths wide and be called the Cross Way. The quarters of the Captain and these two roads having been designed, therefore the quarters of the two battalions of your own men should begin to be designed; and I would quarter one on the right hand (side) of the Captain's Way, and one on the left. And hence beyond the space which is occupied by the width of the Cross Way, I would place thirty two quarters on the left side of the Captain's Way, and thirty two on the right side, leaving a space of thirty arm lengths between the sixteenth and seventeenth quarters which should serve as a transverse road which should cross through all of the quarters of the battalions, as will be seen in their partitioning. Of these two arrangements of quarters, in the first tents that would be adjacent to the Cross Way, I would quarter the heads of menat-arms, and since each company has one hundred and fifty men-at-arms, there would be assigned ten men-at-arms to each of the quarters. The area (space) of the quarters of the Heads should be forty arm lengths wide and ten arm lengths long. And it is to be noted that whenever I say width, I mean from south to north, and when I say length, that from west to east. Those of the men-at-arms should be fifteen arm lengths long and thirty wide. In the next fifteen quarters which in all cases are next [which should have their beginning across the transverse road, and which would have the same space as those of the men-at-arms] I would quarter the light cavalry, which, since they are one hundred fifty, ten cavalrymen would be assigned to each quarter, and in the sixteenth which would be left, I would quarter their Head, giving him the same space which is given to the Head of men-at-arms. And thus the quarters of the cavalry of the two battalions would come to place the Captain's Way in the center and give a rule for the quarters of the infantry, as I will narrate. You have noted that I have quartered the three hundred cavalry of each battalion with their heads in thirty two quarters situated on the Captain's Way, and beginning with the Cross Way, and that from the sixteenth to the seventeenth there is a space of thirty arm lengths to make a transverse road. If I want, therefore, to quarter the twenty companies which constitute the two regular Battalions, I would place the quarters of every two companies behind the quarters of the cavalry, each of which should be fifteen arm lengths long and thirty wide, as those of the cavalry, and should be joined on the rear where they touch one another. And in every first quarter of each band that fronts on the Cross Way, I would quarter the Constable of one company, which would come to correspond with the quartering of the Head of the men-at-arms: and their quarters alone would have a space twenty arm lengths in width and ten in length. And in the other fifteen quarters in each group which follow after this up the Transverse Way, I would quarter a company of infantry on each side, which, as they are four hundred fifty, thirty would be assigned to each quarter. I would place the other fifteen quarters contiguous in each group to those of the cavalry with the same space, in which I would quarter a company of infantry from each group. In the last quarter of each group I would place the Constable of the company, who would come to be adjacent to the Head of the light cavalry, with a space of ten arm lengths long and twenty wide. And thus these first two rows of quarters would be half of cavalry and half of infantry.

And as I want [as I told you in its place] these cavalry to be all effective, and hence without retainers who help taking care of the horses or other necessary things, I would want these infantry quartered behind the cavalry should be obligated to help the owners (of the horses) in providing and taking care of them, and because of this should be exempt from other activities of the camp, which was the manner observed by the Romans. I would also leave behind these quarters on all sides a space of thirty arm lengths to make a road, and I would call one of the First Road on the right hand (side) and the other the First Road on the left, and in each area I would place another row of thirty two double quarters which should face one another on the rear, with the same spaces as those which I have mentioned, and also divided at the sixteenth in the same manner to create a Transverse Road, in which I would quarter in each area four companies of infantry with the Constables in the front at the head and foot (of each row). I would also leave

on each side another space of thirty arm lengths to create a road which should be called the Second Road on the right hand (side) and on the other side the Second Road to the left; I would place another row in each area of thirty two double quarters, with the same distances and divisions, in which I would quarter on every side four companies (of infantry) with their Constables. And thus there would come to be quartered in three rows of quarters per area the cavalry and the companies (of infantry) of the two regular battalions, in the center of which I would place the Captain's Way. The two battalions of auxiliaries [since I had them composed of the same men] I would quarter on each side of these two regular battalions with the same arrangement of double quarters, placing first a row of quarters in which I should quarter half with cavalry and half infantry, distant thirty arm lengths from each other, to create two roads which I should call, one the Third Road on the right hand (side), the other the Third on the left hand. And then I would place on each side two other rows of quarters, separate but arranged in the same way, which are those of the regular battalions, which would create two other roads, and all of these would be called by the number and the band (side) where they should be situated. So that all this part of the Army would come to be quartered in twelve rows of double quarters, and on thirteen roads, counting the Captain's Way and the Cross Way.

I would want a space of one hundred arm lengths all around left between the quarters and the ditch (moat). And if you count all those spaces, you will see, that from the middle of the quarters of the Captain to the east gate, there are seven hundred arm lengths. There remains to us now two spaces, of which one is from the quarters of the Captain to the south gate, the other from there to the north gate, each of which comes to be, measuring from the center point, six hundred thirty five (635) arm lengths. I then subtract from each of these spaces fifty arm lengths which the quarters of the Captain occupies, and forty five arm lengths of plaza which I want to give to each side, and thirty arm lengths of road, which divides each of the mentioned spaces in the middle, and a hundred arm lengths which are left on each side between the quarters and the ditch, and there remains in each area a space left for quarters four hundred arm lengths wide and a hundred long, measuring the length to include the space occupied by the Captain's quarters. Dividing the said length in the middle, therefore, there would be on each side of the Captain forty quarters fifty arm lengths long and twenty wide, which would total eighty quarters, in which would be quartered the general Heads of the battalions, the Chamberlains, the Masters of the camps, and all those who should have an office (duty) in the army, leaving some vacant for some foreigners who might arrive, and for those who should fight through the courtesy of the Captain. On the rear side of the Captain's quarters, I would create a road thirty arm lengths wide from north to south, and call it the Front Road, which would come to be located along the eighty quarters mentioned since this road and the Cross Way would have between them the Captain's quarters and the eighty quarters on their flanks. From this Front road and opposite to the Captain's quarters, I would create another road which should go from there to the west gate, also thirty arm lengths wide, and corresponding in location and length to the Captain's Way, and I should call it the Way of the Plaza. These two roads being located. I would arrange the plaza where the market should be made, which I would place at the head of the Way of the Plaza, opposite to the Captain's quarters, and next to the Front Road, and would want it to be square, and would allow it a hundred twenty one arm lengths per side. And from the right hand and left hand of the said plaza, I would make two rows of quarters, and each row have eight double quarters, which would take up twelve arm lengths in length and thirty in width so that they should be on each side of the plaza, in which there would be sixteen quarters, and total thirty two all together, in which I would quarter that cavalry left over from the auxiliary battalions, and if this should not be enough, I would assign them some of the quarters about the Captain, and especially those which face the ditch.

It remains for us now to quarter the extraordinary pikemen and Veliti, which every battalion has; which you know, according to our arrangement, in addition to the ten companies (of infantry), each has a thousand extraordinary pikemen, and five hundred Veliti; so that each of the two regular battalions have two thousand extraordinary pikemen. and a thousand extraordinary pikemen, and five hundred Veliti; so that each of the two regular battalions have two thousand extraordinary pikemen, and a thousand extraordinary Veliti, and the auxiliary as many as they; so that one also comes to have to quarter six thousand infantry, all of whom I would quarter on the west side along the ditches. From the point therefore of the Front Road and northward leaving the space of a hundred arm lengths from those (quarters) to the ditch, I would place a row of five double quarters which would be seventy five arm lengths long and sixty in width: so that with the width divided, each quarters would be allowed fifteen arm lengths for length and thirty for

width. And as there would be ten quarters, I would quarter three hundred infantry, assigning thirty infantry to each quarters. Leaving then a space of thirty one arm lengths, I would place another row of five double quarters in a similar manner and with similar spaces, and then another, so that there would be five rows of five double quarters, which would come to be fifty quarters placed in a straight line on the north side, each distant one hundred arm lengths from the ditches, which would quarter one thousand five hundred infantry. Turning then on the left hand side toward the west gate, I would want in all that tract between them and the said gate, five other rows of double quarters, in a similar manner and with the same spaces, [it is true that from one row to the other there would not be more than fifteen arm lengths of space] in which there would also be quartered a thousand five hundred infantry: and thus from the north gate to that on the west, following the ditches, in a hundred quarters, divided into ten rows of five double quarters per row, the extraordinary pikemen and Veliti of the regular battalions would be quartered. And so, too, from the west gate to that on the south, following the ditches, in exactly the same manner, in another ten rows of ten quarters per row, the extraordinary pikemen and Veliti of the auxiliary battalions would be quartered. Their Heads, or rather their Constables, could take those quarters on the side toward the ditches which appeared most convenient for themselves.

I would dispose the artillery all along the embankments of the ditches: and in all the other space remaining toward the west. I would quarter all the unarmed men and all the baggage (impedimenta) of the Camp. And it has to be understood that under this name of impedimenta [as you know] the ancients intended all those carriages (wagons) and all those things which are necessary to an Army, except the soldiers; as are carpenters (wood workers), smiths, blacksmiths, shoe makers, engineers, and bombardiers, and others which should be placed among the number of the armed: herdsmen with their herds of castrated sheep and oxen, which are used for feeding the Army: and in addition, masters of every art (trade), together with public wagons for the public provisions of food and arms. And I would not particularly distinguish their quarters: I would only designate the roads that should not be occupied by them. Then the other spaces remaining between the roads, which would be four, I would assign in general to all the impedimenta mentioned, that is, one to the herdsmen, another to Artificers and workmen, another to the public wagons for provisions, and the fourth to the armourers. The roads which I would want left unoccupied would be the Way of the Plaza, the Front Road, and in addition, a road that should be called the Center Road, which should take off at the north and proceed toward the south, and pass through the center of the Way of the Plaza, which, on the west side, should have the same effect as has the Transverse Road on the east side. And in addition to this a Road that should go around the rear along the quarters of the extraordinary pikemen and Veliti And all these roads should be thirty arm lengths wide. And I would dispose the artillery along the ditches on the rear of the camp.

BATTISTA: I confess I do not understand, and I also do not believe that to say so makes me ashamed, as this is not my profession. None the less, I like this organisation very much: I would want only that you should resolve these doubts for me. The one, why you make the roads and the spaces around the quarters so wide. The other, which annoys me more, is this, how are these spaces that you designate for quarters to be used.

FABRIZIO: You know that I made all the roads thirty arm lengths wide, so that a company of infantry is able to go through them in order (formation): which, if you remember well, I told you that each of these (formations) were twenty five to thirty arm lengths wide. The space between the ditch and the quarters, which is a hundred arm lengths wide, is necessary, since the companies and the artillery can be handled here, through which booty is taken, (and) when space is needed into which to retire, new ditches and embankments are made. The quarters very distant from the ditches are better, for they are more distant from the fires and other things that might be able to draw the enemy to attack them. As to the second question, my intention is not that every space designated by me is covered by only one pavilion, but is to be used as an all-round convenience for those who are quartered, with several or few tents, so long as they do not go outside its limits. And in designing these quarters, the men must be most experienced and excellent architects, who, as soon as the Captain has selected the site, know how to give it form, and divide it, and distinguishing the roads, dividing the quarters with cords and hatchets in such a practical manner, that they might be divided and arranged quickly. And if confusion is not to arise, the camp must always face the same way, so that everyone will know on which Road and in which space he has to find his quarters. And this ought to be observed at all times. in every place, and in a manner that it appears to be a movable City, which, wherever it goes, brings with it the same roads, the same houses, and the same appearance: which cannot be observed by those men who, seeking strong locations, have to change the form according to the variations in the sites. But

the Romans made the places strong with ditches, ramparts. and embankments, for they placed a space around the camp, and in front of it they dug a ditch and ordinarily six arm lengths wide and three deep, which spaces they increased according to the (length of) time they resided in the one place, and according as they feared the enemy. For myself, I would not at present erect a stockade (rampart), unless I should want to winter in a place. I would, however, dig the ditch and embankment, not less than that mentioned, but greater according to the necessity. With respect to the artillery, on every side of the encampment, I would have a half circle ditch, from which the artillery should be able to batter on the flanks whoever should come to attack the moats (ditches). The soldiers ought also to be trained in this practice of knowing how to arrange an encampment, and work with them so they may aid him in designing it, and the soldiers quick in knowing their places. And none of these is difficult, as will be told in its proper place. For now I want to pass on to the protection of the camp, which, without the distribution (assignment) of guards, all the other efforts would be useless.

BATTISTA: Before you pass on to the guards, I would want you to tell me, what methods are employed when others want to place the camp near the enemy, for I do not know whether there is time to be able to organise it without danger.

FABRIZIO: You have to know this, that no Captain encamps near the enemy, unless he is disposed to come to an engagement whenever the enemy wants; and if the others are so disposed, there is no danger except the ordinary, since two parts of the army are organised to make an engagement, while the other part makes the encampment. In cases like this, the Romans assigned this method of fortifying the quarters to the Triari, while the Principi and the Astati remained under arms. They did this, because the Triari, being the last to combat, were in time to leave the work if the enemy came, and take up their arms and take their places. If you want to imitate the Romans, you have to assign the making of the encampment to that company which you would want to put in the place of the Triari in the last part of the army.

But let us return to the discussion of the guards. I do not seem to find in connection with the ancients guarding the camp at night, that they had guards outside, distant from the ditches, as is the custom today, which they call the watch. I believe I should do this, when I think how the army could be easily deceived, because of the difficulty which exists in checking (reviewing) them, for they may be corrupted or attacked by the enemy, so that they judged it dangerous to trust them entirely or in part. And therefore all the power of their protection was within the ditches, which they dug with very great diligence and order, punishing capitally anyone who deviated from such an order. How this was arranged by them, I will not talk to you further in order not to tire you, since you are able to see it by yourselves, if you have not seen it up to now. I will say only briefly what would be done by me. I would regularly have a third of the army remain armed every night and a fourth of them always on foot who would be distributed throughout the embankments and all the places of the army, with double guards posted at each of its squares, where a part should remain, and a part continually go from one side of the encampment to the other. And this arrangement I describe, I would also observe by day if I had the enemy near. As to giving it a name, and renewing it every night, and doing the other things that are done in such guarding, since they are things (already) known, I will not talk further of them. I would only remind you of a most important matter, and by observing it do much good, by not observing it do much evil; which is, that great diligence be used as to who does not lodge within the camp at night, and who arrives there anew. And this is an easy matter, to review who is quartered there, with those arrangements we have designated, since every quarter having a predetermined number of men, it is an easy thing to see if there are any men missing or if any are left over; and when they are missing without permission, to punish them as fugitives, and if they are left over, to learn who they are, what they know, and what are their conditions. Such diligence results in the enemy not being able to have correspondence with your Heads, and not to have co-knowledge of your counsels. If this had not been observed with diligence by the Romans, Claudius Nero could not, when he had Hannibal near to him, have departed from the encampment he had in Lucania, and go and return from the Marches, without Hannibal having been aware of it. But it is not enough to make these good arrangements, unless they are made to be observed by great security, for there is nothing that wants so much observance as any required in the army. Therefore, the laws for their enforcement should be harsh and hard, and the executor very hard. The Roman punished with the capital penalty whoever was missing from the guard, whoever abandoned the place given him in combat, whoever brought anything concealed from outside the encampment; if anyone should tell of having performed some great act in battle, and should not have done it; if anyone should have fought except at the command of the Captain, if anyone from fear had thrown aside his arms. And if it occurred that an entire Cohort or an entire Legion had made a similar error, in

order that they not all be put to death, they put their names in a purse, and drew the tenth part, and those they put to death. Which penalty was so carried out, that if everyone did not hear of it, they at least feared it. And because where there are severe punishments, there also ought to be rewards, so that men should fear and hope at the same time, they proposed rewards for every great deed; such as to him who, during the fighting, saved the life of one of its citizens, to whoever first climbed the walls of enemy towns, to whoever first entered the encampment of the enemy, to whoever in battle wounded or killed an enemy, to whoever had thrown him from his horse. And thus any act of virtu was recognised and rewarded by the Consuls, and publicly praised by everyone: and those who received gifts for any of these things, in addition to the glory and fame they acquired among the soldiers, when they returned to their country, exhibited them with solemn pomp and with great demonstrations among their friends and relatives. It is not to marvel therefore, if that people acquired so much empire, when they had so great an observance of punishment and reward toward them, which operated either for their good or evil, should merit either praise or censure; it behooves us to observe the greater part of these things. And it does not appear proper for me to be silent on a method of punishment observed by them, which was, that as the miscreant was convicted before the Tribune or the Consul, he was struck lightly by him with a rod: after which striking of the criminal, he was allowed to flee, and all the soldiers allowed to kill him, so that immediately each of them threw stones or darts, or hit him with other arms, of a kind from which he went little alive, and rarely returned to camp; and to such that did return to camp, he was not allowed to return home except with so much inconvenience and ignominy, that it was much better for him to die. You see this method almost observed by the Swiss, who have the condemned publicly put to death by the other soldiers. Which is well considered and done for the best, for if it is desired that one be not a defender of a criminal, the better remedy that is found, is to make him the punisher of him (the criminal); for in some respects he favors him while from other desires he longs for his punishment, if he himself is the executioner, than if the execution is carried out by another. If you want, therefore, that one is not to be favored in his mistakes by a people, a good remedy is to see to it that the public judged him. In support of this, the example of Manlius Capitol that can be cited, who, when he was accused by the Senate, was defended so much by the public up to the point where it no longer became the judge: but having become arbiter of his cause, condemned him to death. It is, therefore, a method of punishing this, of doing away with tumults, and of having justice observed. And since in restraining armed men, the fear of laws, or of men, is not enough, the ancients added the authority of God: and, therefore, with very great ceremony, they made their soldiers swear to observe the military discipline, so that if they did the contrary, they not only had to fear the laws and men, but God; and they used every industry to fill them with Religion.

BATTISTA: Did the Romans permit women to be in their armies, or that they indulge in indolent games that are used to day?

FABRIZIO: They prohibited both of them, and this prohibition was not very difficult, because the exercises which they gave each day to the soldiers were so many, sometimes being occupied all together, sometimes individually, that no time was left to them to think either of Venery, or of games, or of other things which make soldiers seditious and useless.

BATTISTA: I like that. But tell me, when the army had to take off, what arrangements did they have?

FABRIZIO: The captain's trumpet was sounded three times: at the first sound the tents were taken down and piled into heaps, at the second they loaded the burdens, and at the third they moved in the manner mentioned above, with the impedimenta behind, the armed men on every side, placing the Legions in the center. And, therefore, you would have to have a battalion of auxiliaries move, and behind it its particular impedimenta, and with those the fourth part of the public impedimenta, which would be all those who should be quartered in one of those (sections of the camp) which we showed a short while back. And, therefore, it would be well to have each one of them assigned to a battalion, so that when the army moved, everyone would know where his place was in marching. And every battalion ought to proceed on its way in this fashion with its own impedimenta, and with a quarter of the public (impedimenta) at its rear, as we showed the Roman army marched.

BATTISTA: In placing the encampment, did they have other considerations than those you mentioned?

FABRIZIO: I tell you again, that in their encampments, the Romans wanted to be able to employ the usual form of their method, in the observance of which, they took no other consideration. But as to other considerations, they had two principal ones: the one, to locate themselves in a healthy place: to locate themselves where the enemy should be unable to besiege them, and cut off their supply of water and provisions. To avoid this weakness, therefore, they avoided marshy places, or exposure to noxious winds. They recognised these, not so much from the characteristics of the site, but from the looks of the inhabitants: and if they saw them with poor color, or short winded, or full of other infections, they did not encamp there. As to the other part of not being besieged, the nature of the place must be considered, where the friends are, and where the enemy, and from these make a conjecture whether or not you can be besieged. And, therefore, the Captain must be very expert concerning sites of the countries, and have around him many others who have the same expertness. They also avoided sickness and hunger so as not to disorganise the army; for if you want to keep it healthy, you must see to it that the soldiers sleep under tents, that they are quartered, where there are trees to create shade, where there is wood to cook the food, and not to march in the heat. You need, therefore, to consider the encampment the day before you arrive there, and in winter guard against marching in the snow and through ice without the convenience of making a fire, and not lack necessary clothing, and not to drink bad water. Those who get sick in the house, have them taken care of by doctors; for a captain has no remedy when he has to fight both sickness and the enemy. But nothing is more useful in maintaining an army healthy than exercise: and therefore the ancients made them exercise every day. Whence it is seen how much exercise is of value, for in the quarters it keeps you healthy, and in battle it makes you victorious. As to hunger, not only is it necessary to see that the enemy does not impede your provisions, but to provide whence you are to obtain them, and to see that those you have are not lost. And, therefore, you must always have provisions (on hand) for the army for a month, and beyond that to tax the neighbouring friends that they provide you daily, keep the provisions in a strong place, and, above all, dispense it with diligence, giving each one a reasonable measure each day, and so observe this part that they do not become disorganised; for every other thing in war can be overcome with time, this only with time overcomes you. Never make anyone your enemy, who, while seeking to overcome you with the sword (iron), can overcome you by hunger, because if such a victory is not as honourable, it is more secure and more certain. That army, therefore, cannot escape hunger which does not observe justice, and licentiously consume whatever it please, for one evil causes the provisions not to arrive, and the other that when they arrive, they are uselessly consumed: therefore the ancients arranged that what was given was eaten, and in the time they assigned, so that no soldier ate except when the Captain did. Which, as to being observed by the modern armies, everyone does (the contrary), and deservedly they cannot be called orderly and sober as the ancients, but licentious and drunkards.

BATTISTA: You have said in the beginning of arranging the encampment, that you did not want to stay only with two battalions, but took up four, to show how a fair (sized) army was quartered. Therefore I would want you to tell me two things: the one, if I have more or less men, how should I quarter them: the other, what number of soldiers would be enough to fight against any enemy?

FABRIZIO: To the first question, I reply, that if the army has four or six thousand soldiers more or less, rows of quarters are taken away or added as are needed, and in this way it is possible to accommodate more or fewer infinitely. None the less, when the Romans joined together two consular armies, they made two encampments and had the parts of the disarmed men face each other. As to the second question, I reply, that the regular Roman army had about twenty four thousand soldiers: but when a great force pressed them, the most they assembled were fifty thousand. With this number they opposed two hundred thousand Gauls whom they assaulted after the first war which they had with the Carthaginians. With the same number, they opposed Hannibal. And you have to note that the Romans and Greeks had made war with few (soldiers), strengthened by order and by art; the westerners and easterners had made it with a multitude: but one of these nations serves itself of natural fury, as are the westerners; the other of the great obedience which its men show to their King. But in Greece and Italy, as there is not this natural fury, nor the natural reverence toward their King, it has been necessary to turn to discipline; which is so powerful, that it made the few able to overcome the fury and natural obstinacy of the many. I tell you, therefore, if vou want to imitate the Romans and Greeks, the number of fifty thousand soldiers ought not to be exceeded, rather they should actually be less: for the many cause confusion, and do not allow discipline to be observed nor the orders learned. And Pyrrhus used to say that with fifteen thousand men he would assail the world.

But let us pass on to another part. We have made our army win an engagement, and I showed the troubles that can occur in battle; we have made it march, and I have narrated with what impedimenta it can be surrounded while marching: and lastly we have quartered it: where not only a little repose from past hardship ought to be taken, but also to think about how the war ought to be concluded; for in the quarters, many things are discussed, especially if there remain enemies in the field, towns under suspicion, of which it is well to reassure oneself, and to capture those which are hostile. It is necessary, therefore, to come to these demonstrations, and to pass over this difficulty with that (same) glory with which we have fought up to the present. Coming down to particulars, therefore, that if it should happen to you that many men or many peoples should do something, which might be useful to you and very harmful to them, as would be the destruction of the walls of their City, or the sending of many of themselves into exile, it is necessary that you either deceive them in a way that everyone should believe he is affected, so that one not helping the other, all find themselves oppressed without a remedy, or rather, to command everyone what they ought to do on the same day, so that each one believing himself to be alone to whom the command is given, thinks of obeying it, and not of a remedy; and thus, without tumult, your command is executed by everyone. If you should have suspicion of the loyalty of any people, and should want to assure yourself and occupy them without notice, in order to disguise your design more easily, you cannot do better than to communicate to him some of your design, requesting his aid, and indicate to him you want to undertake another enterprise and to have a mind alien to every thought of his: which will cause him not to think of his defense, as he does not believe you are thinking of attacking him, and he will give you the opportunity which will enable you to satisfy your desire easily If you should have present in your army someone who keeps the enemy advised of your designs, you cannot do better if you want to avail yourself of his evil intentions, than to communicate to him those things you do not want to do, and keep silent those things you want to do, and tell him you are apprehensive of the things of which you are not apprehensive, and conceal those things of which you are apprehensive: which will cause the enemy to undertake some enterprise, in the belief that he knows your designs, in which you can deceive him and defeat him. If you should design [as did Claudius Nerol to decrease your army, sending aid to some friend, and they should not be aware of it, it is necessary that the encampment be not decreased, but to maintain entire all the signs and arrangements, making the same fires and posting the same guards as for the entire army. Likewise, if you should attach a new force to your army, and do not want the enemy to know you have enlarged it, it is necessary that the encampment be not increased, for it is always most useful to keep your designs secret. Whence Metellus, when he was with the armies in Spain, to one who asked him what he was going to do the next day, answered that if his shirt knew it, he would bum it. Marcus Crassus, to one who asked him when he was going to move his army, said: "do you believe you are alone in not hearing the trumpets?" If you should desire to learn the secrets of your enemy and know his arrangement, some used to send ambassadors, and with them men expert in war disguised in the clothing of the family, who, taking the opportunity to observe the enemy army, and consideration of his strengths and weaknesses, have given them the occasion to defeat him. Some have sent a close friend of theirs into exile and through him have learned the designs of their adversary. You may also learn similar secrets from the enemy if you should take prisoners for this purpose. Marius, in the war he waged against Cimbri, in order to learn the loyalty of those Gauls who lived in Lombardy and were leagued with the Roman people, sent them letters, open and sealed: and in the open ones he wrote them that they should not open the sealed ones except at such a time: and before that time, he called for them to be returned, and finding them opened, knew their loyalty was not complete. Some Captains, when they were assaulted have not wanted to go to meet the enemy, but have gone to assail his country, and constrain him to return to defend his home. This often has turned out well, because your soldiers begin to win and fill themselves with booty and confidence, while those of the enemy become dismayed, it appearing to them that from being winners, they have become losers. So that to whoever has made this diversion, it has turned out well. But this can only be done by that man who has his country stronger than that of the enemy, for if it were otherwise, he would go on to lose. It has often been a useful thing for a Captain who finds himself besieged in the quarters of the enemy, to set in motion proceedings for an accord, and to make a truce with him for several days; which only any enemy negligent in every way will do, so that availing yourself of his negligence, you can easily obtain the opportunity to get out of his hands. Sulla twice freed himself from his enemies in this manner, and with this same deceit. Hannibal in Spain got away from the forces of Claudius Nero, who had besieged him.

It also helps one in freeing himself from the enemy to do something in addition to those mentioned, which keeps him at bay. This is done in two ways: either by assaulting him with part of your forces, so that intent on the battle, he gives the rest of your forces the opportunity to be able to save themselves, or to have some new incident spring up, which, by the novelty of the thing, makes him wonder, and for this reason to become apprehensive and stand still, as you know Hannibal did, who, being trapped by Fabius Maximus, at night placed some torches between the horns of many oxen, so that Fabius is suspense over this novelty, did not think further of impeding his passage. A Captain ought, among all the other actions of his, endeavor with every art to divide the forces of the enemy, either by making him suspicious of his men in whom he trusted, or by giving him cause that he has to separate his forces, and, because of this, become weaker. The first method is accomplished by watching the things of some of those whom he has next to him, as exists in war, to save his possessions, maintaining his children or other of his necessities without charge. You know how Hannibal, having burned all the fields around Rome, caused only those of Fabius Maximus to remain safe. You know how Coriolanus, when he came with the army to Rome, saved the possessions of the Nobles, and burned and sacked those of the Plebs. When Metellus led the army against Jugurtha, all me ambassadors, sent to him by Jugurtha, were requested by him to give up Jugurtha as a prisoner; afterwards, writing letters to these same people on the same subject, wrote in such a way that in a little while Jugurtha became suspicious of all his counsellors, and in different ways, dismissed them. Hannibal, having taken refuge with Antiochus, the Roman ambassadors frequented him so much at home, that Antiochus becoming suspicious of him, did not afterwards have any faith in his counsels. As to dividing the enemy forces, there is no more certain way than to have one country assaulted by part of them (your forces), so that being constrained to go to defend it, they (of that country) abandon the war. This is the method employed by Fabius when his Army had encountered the forces of the Gauls, the Tuscans. Umbrians, and Samnites. Titus Didius, having a small force in comparison with those of the enemy, and awaiting a Legion from Rome, the enemy wanted to go out to meet it; so that in order that it should not do so, he gave out by voice throughout his army that he wanted to undertake an engagement with the enemy on the next day; then he took steps that some of the prisoners he had were given the opportunity to escape, who carried back the order of the Consul to fight on the next day, (and) caused the enemy, in order not to diminish his forces, not to go out to meet that Legion: and in this way, kept himself safe. Which method did not serve to divide the forces of the enemy, but to double his own. Some, in order to divide his (the enemy) forces, have employed allowing him to enter their country, and (in proof) allowed him to take many towns so that by placing guards in them, he diminished his forces, and in this manner having made him weak, assaulted and defeated him. Some others, when they wanted to go into one province, feigned making an assault on another, and used so much industry, that as soon as they extended toward that one where there was no fear they would enter have overcome it before the enemy had time to succor it. For the enemy, as he is not certain whether you are to return back to the place first threatened by you, is constrained not to abandon the one place and succor the other, and thus often he does not defend either. In addition to the matters mentioned, it is important to a Captain when sedition or discord arises among the soldiers, to know how to extinguish it with art. The better way is to castigate the heads of this folly (error); but to do it in a way that you are able to punish them before they are able to become aware of it. The method is, if they are far from you, not to call only the guilty ones, but all the others together with them, so that as they do not believe there is any cause to punish them, they are not disobedient, but provide the opportunity for punishment. When they are present, one ought to strengthen himself with the guiltless, and by their aid, punish them. If there should be discord among them, the best way is to expose them to danger, which fear will always make them united. But, above all, what keeps the Army united, is the reputation of its Captain, which only results from his virtu, for neither blood (birth) or authority attain it without virtu. And the first thing a Captain is expected to do, is to see to it that the soldiers are paid and punished; for any time payment is missed, punishment must also be dispensed with, because you cannot castigate a soldier you rob, unless you pay him; and as he wants to live, he can abstain from being robbed. But if you pay him but do not punish him, he becomes insolent in every way, because you become of little esteem, and to whomever it happens, he cannot maintain the dignity of his position; and if he does not maintain it, of necessity, tumults and discords follow, which are the ruin of an Army. The Ancient Captains had a molestation from which the present ones are almost free, which was the interpretation of sinister omen to their undertakings; for if an arrow fell in an army, if the Sun or the Moon was obscured, if an earthquake occurred, if the Captain fell while either mounting or dismounting from his horse, it was interpreted in a sinister fashion by the soldiers, and instilled so much fear in them, that when they came to an engagement, they were easily defeated. And, therefore, as soon as such an incident occurred, the ancient Captains either demonstrated the cause of it or reduced it to its natural causes. or interpreted it to (favor) their own purposes. When Caesar went to Africa, and having fallen while he was putting out to sea, said, "Africa, I have taken you": and many have profited from an eclipse of the Moon and from earthquakes: these things cannot happen in our time, as much because our men are not as superstitious, as because our Religion, by itself,

Copyright © 2018 by Lord Henfield, Guildford Scientific Press PAGE 3393 entirely takes away such ideas. Yet if it should occur, the orders of the ancients should be imitated. When, either from hunger, or other natural necessity, or human passion, your enemy is brought to extreme desperation, and, driven by it, comes to fight with you, you ought to remain within your quarters, and avoid battle as much as you can. Thus the Lacedemonians did against the Messinians: thus Caesar did against Afranius and Petreius. When Fulvius was Consul against the Cimbri, he had the cavalry assault the enemy continually for many days, and considered how they would issue forth from their quarters in order to pursue them; whence he placed an ambush behind the quarters of the Cimbri, and had them assaulted by the cavalry, and when the Cimbri came out of their quarters to pursue them, Fulvius seized them and plundered them. It has been very effective for a Captain, when his army is in the vicinity of the enemy army, to send his forces with the insignia of the enemy, to rob and burn his own country: whence the enemy, believing they were forces coming to their aid, also ran out to help them plunder, and, because of this, have become disorganised and given the adversary the faculty of overcoming them. Alexander of Epirus used these means fighting against the Illirici, and Leptenus the Syracusan against the Carthaginians, and the design succeeded happily for both. Many have overcome the enemy by giving him the faculty of eating and drinking beyond his means, feigning being afraid, and leaving his quarters full of wine and herds, and when the enemy had filled himself beyond every natural limit, they assaulted him and overcome him with injury to him. Thus Tamirus did against Cyrus, and Tiberius Gracchus against the Spaniards. Some have poisoned the wine and other things to eat in order to be able to overcome them more easily. A little while ago, I said I did not find the ancients had kept a night Watch outside, and I thought they did it to avoid the evils that could happen, for it has been found that sometimes, the sentries posted in the davtime to keep watch for the enemy, have been the ruin of him who posted them; for it has happened often that when they had been taken, and by force had been made to give the signal by which they called their own men, who, coming at the signal, have been either killed or taken. Sometimes it helps to deceive the enemy by changing one of your habits, relying on which, he is ruined: as a Captain had already done, who, when he wanted to have a signal made to his men indicating the coming of the enemy, at night with fire and in the daytime with smoke, commanded that both smoke and flame be made without any intermission; so that when the enemy came, he should remain in the belief that he came without being seen, as he did not see the signals (usually) made to indicate his discovery, made [because of his going disorganised] the victory of his adversary easier. Menno Rodius, when he wanted to draw the enemy from the strong places, sent one in the disguise of a fugitive, who affirmed that his army was full of discord, and that the greater part were deserting, and to give proof of the matter, had certain tumults started among the quarters: whence to the enemy, thinking he was able to break him, assaulted him and was routed.

In addition to the things mentioned, one ought to take care not to bring the enemy to extreme desperation; which Caesar did when he fought the Germans, who, having blocked the way to them, seeing that they were unable to flee, and necessity having made them brave, desired rather to undergo the hardship of pursuing them if they defended themselves. Lucullus, when he saw that some Macedonian cavalry who were with him, had gone over to the side of the enemy, quickly sounded the call to battle, and commanded the other forces to pursue it: whence the enemy, believing that Lucullus did not want to start the battle, went to attack the Macedonians with such fury, that they were constrained to defend themselves, and thus, against their will, they became fighters of the fugitives. Knowing how to make yourself secure of a town when you have doubts of its loyalty once you have conquered it, or before, is also important; which some examples of the ancients teach you. Pompey, when he had doubts of the Catanians, begged them to accept some infirm people he had in his army, and having sent some very robust men in the disguise of infirm ones, occupied the town. Publius Valerius, fearful of the loyalty of the Epidaurians, announced an amnesty to be held, as we will tell you, at a Church outside the town, and when all the public had gone there for the amnesty, he locked the doors, and then let no one out from inside except those whom he trusted. Alexander the Great, when he wanted to go into Asia and secure Thrace for himself, took with him all the chiefs of this province, giving them provisions, and placed lowborn men in charge of the common people of Thrace; and thus he kept the chiefs content by paying them, and the common people quiet by not having Heads who should disquiet them. But among all the things by which Captains gain the people over to themselves, are the examples of chastity and justice, as was that of Scipio in Spain when he returned that girl, beautiful in body, to her husband and father, which did more than arms in gaining over Spain. Caesar, when he paid for the lumber that he used to make the stockades around his army in Gaul, gained such a name for himself of being just, that he facilitated the acquisition of that

province for himself. I do not know what else remains for me to talk about regarding such events, and there does not remain any part of this matter that has not been discussed by us. The only thing lacking is to tell of the methods of capturing and defending towns, which I am about to do willingly, if it is not painful for you now.

BATTISTA: Your humaneness is so great, that it makes us pursue our desires without being afraid of being held presumptuous, since you have offered it willingly, that we would be ashamed to ask you. Therefore we say only this to you, that you cannot do a greater or more thankful benefit to us than to furnish us this discussion. But before you pass on to that other matter, resolve a doubt for us: whether it is better to continue the war even in winter, as is done today, or wage it only in the summer, and go into quarters in the winter, as the ancients did.

FABRIZIO: Here, if there had not been the prudence of the questioner, some part that merits consideration would have been omitted. I tell you again that the ancients did everything better and with more prudence than we; and if some error is made in other things, all are made in matters of war. There is nothing more imprudent or more perilous to a Captain than to wage war in winter, and more dangerous to him who brings it, than to him who awaits it. The reason is this: all the industry used in military discipline, is used in order to be organised to undertake an engagement with your enemy, as this is the end toward which a Captain must aim, for the engagement makes you win or lose a war. Therefore, whoever know how to organise it better, and who has his army better disciplined, has the greater advantage in this, and can hope more to win it. On the other hand, there is nothing more inimical to organisation than the rough sites, or cold and wet seasons; for the rough side does not allow you to use the plentitude (of your forces) according to discipline, and the cold and wet seasons do not allow you to keep your forces together, and you cannot have them face the enemy united, but of necessity, you must quarter them separately, and without order, having to take into account the castles, hamlets, and farm houses that receive you; so that all the hard work employed by you in disciplining your army is in vain. And do not marvel if they war in winter time today, for as the armies are without discipline, and do not know the harm that is done to them by not being quartered together, for their annoyance does not enable those arrangements to be made and to observe that discipline which they do not have. Yet, the injury caused by campaigning in the field in the winter ought to be observed, remembering that the French in the year one thousand five hundred three (1503) were routed on the Garigliano by the winter, and not by the Spaniards. For, as I have told you, whoever assaults has even greater disadvantage, because weather harms him more when he is in the territory of others, and wants to make war. Whence he is compelled either to withstand the inconveniences of water and cold in order to keep together, or to divide his forces to escape them. But whoever waits, can select the place to his liking, and await him (the enemy) with fresh forces, and can unite them in a moment, and go out to find the enemy forces who cannot withstand their fury. Thus were the French routed, and thus are those always routed who assault an enemy in winter time, who in itself has prudence. Whoever, therefore, does not want the forces, organisation, discipline, and virtu, in some part, to be of value, makes war in the field in the winter time. And because the Romans wanted to avail themselves of all of these things, into which they put so much industry, avoided not only the winter time, but rough mountains and difficult places, and anything else which could impede their ability to demonstrate their skill and virtu. So this suffices to (answer) your question; and now let us come to treat of the attacking and defending of towns, and of the sites, and of their edifices.

MACHIAVELLI ART OF WAR, 7TH BOOK

You ought to know that towns and fortresses can be strong either by nature or industry. Those are strong by nature which are surrounded by rivers or marshes, as is Mantua or Ferrara, or those situated on a rock or sloping mountain, as Monaco and San Leo: for those situated on mountains which are not difficult to climb, today are [with respect to caves and artillery] very weak. And, therefore, very often today a plain is sought on which to build (a city)to make it strong by industry. The first industry is, to make the walls twisted and full of turned recesses; which pattern results in the enemy not being able to approach them, as they will be able to be attacked easily not only from the front, but on the flanks. If the walls are made too high, they are excessively exposed to the blows of the artillery; if they are made too low, they are very easily scaled. If you dig ditches (moats) in front of them to make it difficult (to employ) ladders, if it should happen that the enemy fills them [which a large army can do easily]the wall becomes prev to the enemy. I believe, therefore, [subject to a better judgement] that if you want to make provision against both evils the wall ought to be made high, with the ditches inside and not outside. This is the strongest way to build that is possible, for it protects you from artillery and ladders, and does not give the enemy the faculty of filling the

ditches. The wall, therefore, ought to be as high as occurs to you, and not less than there from lengths wide, to make it more difficult to be ruined. It ought to have towers placed at intervals of two hundred arm lengths. The ditch inside ought to be at least thirty arm lengths wide and twelve deep, and all the earth that is excavated in making the ditch is thrown toward the city, and is sustained by a wall that is part of the base of the ditch, and extends again as much above the ground, as that a man may take cover behind it: which has the effect of making the depth of the ditch greater. In there as of the ditch, every two hundred arm lengths, there should be a matted enclosure, which with the artillery, causes injury to anyone who should descend into it. The heavy artillery which defends the city, are placed behind the wall enclosing the ditch; for to defend the wall from the front, as it is high, it is not possible to use conveniently anything else other than small or middle sized guns. If the enemy comes to scale your wall, the height of the first wall easily protects you. If he comes with artillery, he must first batter down the first wall: but onceit is battered down, because the nature of all batterings is to cause the wall to fall toward the battered side, the ruin of the wall will result [since it does not find a ditch which receives and hides it] in doubling the depth of the ditch, so that it is not possible for you to pass on further as you will find aruin that holds you back and a ditch which will impede you, and from the wall of the ditch, in safety, the enemy artillery kills you. The only remedy there exists for you, is to fill up the ditch: which is very difficult, as much because its capacity is large, as from the difficulty you have in approaching it, since the walls being winding and recessed, you can enter among them only with difficulty, for the reasons previously mentioned; and then, having to climb over the ruin with the material in hand, causes you a very great difficulty: so that I know a city so organised is completely indestructible.

BATTISTA: If, in addition to the ditch inside, there should be one also on the outside, wouldn't (the encampment) be stronger?

FABRIZIO: It would be, without doubt; but my reasoning is, that if you want to dig one ditch only, it is better inside than outside.

BATTISTA: Would you have water in the ditch, or would you leave them dry?

FABRIZIO: Opinions are different; for ditches full of water protect you from (subterranean) tunnels, the ditches without water make it more difficult for you to fill them in again. But, considering everything, I would have them without water; for they are more secure, and, as it has been observed that in winter time the ditches ice over, the capture of a city is made easy, as happene dat Mirandola when Pope Julius besieged it. And to protect your self from tunnels, I would dig them so deep, that whoever should want to go (tunnel) deeper, should find water. I would also build the fortresses in a way similar to the walls and ditches, so that similar difficulty would be encountered in destroying it I want to call to mind one good thing to anyone who defends a city. This is, that they do not erect bastions outside, and they be distant from its wall. And another to anyone who builds the fortresses: And this is, that he not build any redoubts in them, into which who ever is inside can retire when the wall is lost. What makes me give the first counsel is, that no one ought to do anything, through the medium of which, you begin to lose your reputation without any remedy, the loss of which makes others esteem vouless. and dismay those who undertake your defense. And what I say will always happen to you if you erect bastions outside the town you have to defend, for you will always lose them, as you are unable to defend small things when they are placed under the fury of the artillery; so that in losing them, they become the beginning and the cause of your ruin. Genoa, when it rebelled from King Louis of France, erected some bastions on the hills outside the City, which, as soon as they were lost, and they were llost quickly, also caused the city to be lost. As to the second counsel, I affirm there is nothing more dangerous concerning a fortress, than to be able to retire into it, for the hope that men have (lose) when they abandon a place, cause it to be lost, and when it is lost, it then causes the entire fortress to be lost. For an example, there is the recent loss of the fortress of Forli when the Countess Catherine defended it against Caes are Borgia, son of Pope Alexander the Sixth, who had led the army of the King of France. That entire fortress was full of places by both of them: For it was originally a citadel. There was amoat before coming to the fortress, so that it was entered by means of a draw bridge. The fortress was divided into three parts, and each part separated by a ditch, and with water between them; and one passed from one place to another by means of bridges:whence the Duke battered one of those parts of the fortress with artillery, and opened up part of a wall; whence Messer Giovanni Da Casale, who was in charge of the garrison, did not think of defending that opening, but abandoned to retire into the other places; so that the forces of the Duke, having entered that part without opposition, immediately seized all of it, for they became masters of the bridges that connected the members (parts) with each other. He lost the fort which was held to be indestructible because of two mistakes: one, because it had so

many redoubts: the other, because no one was made master of his bridges (they were unprotected). The poorly built fortress and the little prudence of the defender, therefore, brought disgrace to the magnanimous enterprise of the Countess, who had the courage to face an army which neither the King of Naples, nor the Duke of Milan, had faced. And although his (the Duke) efforts did not have a good ending, none the less, he became noted for those honours which his virtumerited. Which was testified to by the many epigrams made in those times praising him. If I should therefore have to build a fortress, I would make its walls strong, and ditches in the manner we have discussed, nor would I build anything else to live in but houses, and they would be weak and low, so that they would not impede the sight of the walls to anyone who might be in the plaza, so that the Captain should be able to see with (his own) eyes where he could be of help, and that everyone should understand that if the walls and the ditch were lost, the entire fortress would be lost. And even if I should build some redoubts, I would have the bridges so separated, that each part should be master of (protect)the bridge in its own area, arranging that it be buttressed on its pilasters in the middle of the ditch.

BATTISTA: You have said that, today, the little thing scan not be defended, and it seems to me I have understood the opposite, that the smaller the thing was, the better it was defended.

FABRIZIO: You have not understood well, for today that place can not be called strong, where he who defends it does not have room to retire among new ditches and ramparts: for such is the fury of the artillery, that he who relies on the protection of only one wall or rampart, deceives himself. And as the bastions [if you want them not to exceed their regular measurements, for then they would be terraces and castles] are not made so that others can retire into them, they are lost quickly. And therefore it is a wise practice to leave these bastions outside, and fortify the entrances of the terraces, and cover their gates with revets, so that one does not go in or out of the gate in a straight line, and there is a ditch with a bridge over it from the revet to the gate. The gates are also fortified with shutters, so as to allow your men to reenter, when, after going out to fight, it happens that the enemy drives them back, and in the ensuing mixing of men, the enemy does not enter with them. And therefore, these things have also been found which the ancients called "cataracts", which, being let down, keep out the enemy but saves one's friends; for in such cases, one can not avail himself of anything else, neither bridges, or the gate, since both are occupied by the crowd.

BATTISTA: I have seen these shutters that you mention, made of small beams, in Germany, in the form of iron grids, while those of ours are made entirely of massive planks. I would want to know whence this difference arises, and which is stronger.

FABRIZIO: I will tell you again, that the methods and organisations of war in all the world, with respect to those of the ancients, are extinct; but in Italy, they are entirely lost, and if there is something more powerful, it results from the examples of the Ultra montanes. You may have heard, and these others can remember, how weakly things were built before King Charles of France crossed into Italy in the year one thousand four hundred ninety four (1494). The battlements were made a half arm length thin (wide), the places for the cross-bowmen and bombardiers (gunners)were made with a small aperture outside and a large one inside, and with many other defects, which I will omit, not to be tedious; for the defenses are easily taken away from slender battlements; the (places for) bombardiers built that way are easily opened(demolished). Now from the French, we have learned to make the battlements wide and large, and also to make the (places of the)bombardiers wide on the inside, and narrow it at the center of the wall, and then again widen it up to the outside edge: and this results in the artillery being able to demolish its defenses only with difficulty, The French, moreover, have many other arrangements such as these, which, because they have not been seen thus, have not been given consideration. Among which, is this method of the shutters made in the form of a grid, which is by far a better method than yours; for if you have to repair the shutters of agate such as yours, lowering it if you are locked inside, and hence are unable to injure the enemy, so that they can attack it safely either in the dark or with a fire. But if it is made in the shape of a grid, you can, once it is lowered, by those weaves and intervals, to be able to defend it with lances, cross-bows, and every other kind of arms.

BATTISTA: I have also seen another Ultra montane custom in Italy, and it is this, making the carriages of the artillery with the spokes of the wheels bent toward the axles. I would like to know why they make them this way, as it seems to me they would be stronger straight, as those of our wheels.

FABRIZIO: Never believe that things which differ from the ordinary are made at home, but if you would believe that I should make them such as to be more beautiful, you would err;for where strength is necessary, no account is taken of beauty;but they all arise from being safer and stronger than ours. There a son is this. When the carriage is loaded, it either

goes on a level, or inclines to the right or left side. When it goes level, the wheels equally sustain the weight, which, being divided equally between them, does not burden them much; when it inclines, it comes to have all the weight of the load upon that wheel on which it inclines. If its spokes are straight, they can easily collapse, since the wheel being inclined, the spokes also come to incline, and do not sustain the weight in a straight line. And, thus, when the carriage rides level and when they carry less weight, they come to be stronger; when the carriage rides inclined and when they carry more weight, they are weaker. The contrary happens to the bent spokes of the French carriages; for when the carriageinc lines to one side, it points (leans straight) on them, since being ordinarily bent, they then come to be (more) straight (vertical), and can sustain all the weight strongly; and when the carriage goes level and they (the spikes) are bent, they sustain half the weight.

But let us return to our Cities and Fortresses. The French, for the greater security of their towns, and to enable them during sieges to put into and withdraw forces from them more easily, also employ, in addition to the things mentioned, another arrangement, of which I have not yet seen any example in Italy: and it is this, that they erect two pilasters at the outside point of a draw-bridge, and upon each of them they balance a beam so that half of it comes over the bridge, and the other half outside. Then they join small beams to the part outside, which are woven together from one beam to another in the shape of a grid, and on the inside they attach a chain to the end of each beam. When they want to close the bridge from the outside, therefore, they release the chains and allow all that gridded part to drop, which closes the bridge when it is lowered, and when they want to open it, they pull on the chains, and they (gridded beams) come to be raised; and they can be raised so that a man can pass under, but not a horse, and also so much that a horse with the man can pass under, and also can be closed entirely, for it is lowered and raised like a lace curtain. This arrangement is more secure than the shutters: for it can be impeded by the enemy so that it cannot come down only with difficulty,(and) it does not come down in a straight line like the shutters which can easily be penetrated. Those who want to build a City, therefore, ought to have all the things mentioned installed; and in addition. they should want at least one mile around the wall where either farming or building would not be allowed, but should be open field where no bushes, embankments, trees, or houses, should exist which would impede the vision, and which should be in the rear of a besieging enemy. It is to be noted that a town which has its ditches outside with its embankments higher than the ground, is very weak; for they provide a refuge for the enemy who assaults you, but does not impede him in attacking you, because they can be easily forced (opened) and give his artillery an emplacement.

But let us pass into the town. I do not want to waste much time in showing you that, in addition to the things mentioned previously, provisions for living and fighting supplies must also be included, for they are the things which everyone needs. and without them, every other provision is in vain. And, generally, two things ought to be done, provision yourself, and deprive the enemy of the opportunity to avail himself of the resources of your country. Therefore, any straw, grain, and cattle, which you cannot receive in your house, ought to be destroyed. Whoever defends a town ought to see to it that nothing is done in a tumultuous and disorganised manner, and have means to let everyone know what he has to do in any incident. The manner is this, that the women, children, aged. and the public stay at home, and leave the town free to the young and the brave: who armed, are distributed forde fense. part being on the walls, part at the gates, part in the principal places of the City, in order to remedy those evils which might arise within: another part is not assigned to any place, but is prepared to help anyone requesting their help. And when matters are so organised, only with difficulty can tumults arise which disturb you. I want you to note also that in attacking and defending Cities, nothing gives the enemy hope of being able to occupy a town, than to know the inhabitants are not in the habit of looking for the enemy; for often Cities are lost entirely from fear, without any other action. When one assaults such a City, he should make all his appearances (ostentatious) terrible. On the other hand, he who is assaulted ought to place brave men, who are not afraid of thoughts, but by arms, on the side where the enemy (comes to) fight; for if the attempt proves vain, courage grows in the besieged, and then the enemy is forced to overcome those inside with his virtu and his reputation.

The equipment with which the ancients defended the towns were many, such as, Ballistas, Onagers, Scorpions, Arc-Ballistas, Large Bows, Slingshots; and those with which they assaulted were also many, such as, Battering Rams, Wagons, Hollow Metal Fuses (Muscoli), Trench Covers (Plutei), Siege Machines (Vinee), Scythes, Turtles(somewhat similar to present day tanks). In place of these things, today there is the artillery, which serves both attackers and defenders, and, hence, I will not speak further about it. But let us return to our discussion, and come to the details of the siege (attack).

and not to be forced (to capitulate) by assaults. As to hunger. it has been said that it is necessary, before the siege arrives, to be well provided with food. But when it is lacking during a long siege, some extraordinary means of being provided by friends who want to save you, have been observed to be employed, especially if a river runs in the middle of the besieged City, as were the Romans, when their castle of Casalino was besieged by Hannibal, who, not being able to send them anything else byway of the river, threw great quantities of nuts into it, which being carried by the river without being able to be impeded, fed the Casalinese for some time. Some, when they were besieged, in order to show the enemy they had grain left over, and to make them despair of being able to besiege (defeat) them by hunger, have either thrown bread outside the walls, or have given a calf grain to eat, and then allowed it to be taken, so that when it was killed, and being found full of grain, gave signs of an abundance which they do not have. On the other hand, excellent Captains have used various methods to enfamish the enemy. Fabius allowed the Campanians to sow so that they should lack that grain which they were sowing. Dionysius, when he was besieged at Reggio, feigned wanting to make an accord with them, and while it was being drawn, had himself provided with food, and then when, by this method, had depleted them of grain, pressed them and starved them. Alexander the Great, when he wanted to capture Leucadia, captured all the surrounding castles, and allowed the men from them to take refuge in it (the City), and thus by adding a great multitude. he starved them. As to assaults, it has been said that one ought to guard against the first onrush, with which the Romans often occupied many towns, assaulting them all at once from every side, and they called it attacking the city by its crown: as did Scipio when he occupied new Carthage in Spain. If this onrush is withstood, then only with difficulty will you be overcome. And even if it should occur that the enemy had entered inside the city by having forced the walls, even the small terraces give you some remedy if they are not abandoned; for many armies have, once they have entered into a town, been repulsed or slain. The remedy is, that the towns people keep themselves in high places, and fight them from their houses and towers. Which thing, those who have entered in the City, have endeavored to win in two ways: the one, to open the gates of the City and make a way for the townspeople by which they can escape in safety: the other, to send out a (message)by voice signifying that no one would be harmed unless armed, and whoever would throw his arms on the ground, they would pardon. Which thing has made the winning of many Cities easy. In addition to this, Cities are easy to capture if you fall on them unexpectedly, which you can do when you find yourself with your army far away, so that they do not believe that you either want to assault them, or that you can do it without your presenting yourself, because of the distance from the place. Whence, if you assault them secretly and quickly, it will almost always happen that you will succeed in reporting the victory. I unwillingly discuss those things which have happened in our times, as I would burden you with myself and my (ideas), and I would not know what to say in discussing other things. None the less, concerning this matter, I can not but cite the example of Cesare Borgia, called the Duke Valentine, who, when he was at Nocera with his forces, under the pretext of going to harm Camerino, turned toward the State of Urbino, and occupied a State in one day and without effort, which some other, with great time and expense, would barely have occupied. Those who are besieged must also guard themselves from the deceit and cunning of the enemy, and, therefore, the besieged should not trust anything which they see the enemy doing continuously, but always believe they are being done by deceit, and can change to injure them. When Domitius Calvinus was besieging a town, heunder took habitually to circle the walls of the City every day with a good part of his forces. Whence the townspeople, believing he was doing this for exercise, lightened the guard: when Domitius became aware of this, he assaulted them, and destroyed them. Some Captains, when they heard beforehand that aid was to come to the besieged. have clothed their soldiers with the insignia of those who were to come, and having introduced them inside, have occupied the town. Chimon, the Athenian, one night set fire to a Temple that was outside the town, whence, when the townspeople arrived to succor it, they left the town to the enemy to plunder. Some have put to death those who left the besieged castle to blacksmith(shoe horses), and redressing their soldiers with the clothes of the blacksmiths, who then surrendered the town to him. The ancient Captains also employed various methods to despoil the garrisons of the towns they want to take. Scipio, when he was in Africa, and desiring to occupy several castles in which garrisons had been placed by Carthaginians feigned several times wanting to assault them, but then from fear not only abstained, but drew away from them. Which Hannibal believing to be true, in order to pursue him with a larger force and be able to attack him more easily, withdrew all the garrisons from them: (and) Scipio becoming aware of this, sent Maximus, his Captain, to

being able to capture it, and turning to other places, caused her, in order to succor them, to empty herself of the garrison, so that it became easy to be forced (captured). Many have polluted the water and diverted rivers to take a town. even though they then did not succeed. Sieges and surrenders are also easily accomplished, by dismaying them by pointing out an accomplished victory, or new help which is come to their disfavor. The ancient Captains sought to occupy towns by treachery, corrupting some inside, but have used different methods. Some have sent one of their men under the disguise of a fugitive, who gained authority and confidence with the enemy, which he afterward used for his own benefit. Many by this means have learned the procedures of the guards, and through this knowledge have taken the town. Some have blocked the gate so that it could not be locked with a cart or a beam under some pretext, and by this means, made the entry easy to the enemy. Hannibal persuaded one to give him a castle of the Romans, and that he should feign going on a hunt at night, to show his inability to go by day for fear of the enemy, and when he returned with the game, placed his men inside with it, and killing the guard, captured the gate. You also deceive the besieged by drawing them outside the town and distant from it, by feigning flight when they assault you. And many [among whom was Hannibal] have, in addition, allowed their quarters to betaken in order to have the opportunity of placing them in their midst, and take the town from them. They deceive also by feigning departure, as did For minus, the Athenian, who having plundered the country of the Calcidians, afterwards received their ambassadors, and filled their City with promises of safety and good will, who, as men of little caution, were shortly after captured by Forminus. The besieged ought to look out for men whom they have among them that are suspect, but sometimes they may want to assure themselves of these by reward, as well as by punishment. Marcellus, recognising that Lucius Bancius Nolanus had turned to favor Hannibal, employed so much humanity and liberality toward him, that, from an enemy, he made him a very good friend. The besieged ought to use more diligence in their guards when the enemy is distant, than when he is near. And they ought to guard those places better which they think can be attacked less; for many towns have been lost when the enemy assaulted them on a side from which they did not believe they would be assaulted. And this deception occurs for two reasons: either because the place is strong and they believe it is inaccessible, or because the enemy cunningly assaults him on one side with feigned uproars, and on the other silently with the real assaults. And, therefore, the besieged ought to have a great awareness of this, and above all at all times, but especially at night, have good guards at the walls, and place there not only men, but dogs; and keep them ferocious and ready, which by smell, detect the presence of the enemy, and with their baying discover him. And, in addition to dogs, it has been found that geese have also saved a City, as happened to the Romans when the Gauls besieged the Capitol. When Athens was besieged by the Spartans, Alcibiades, in order to see if the guards were awake, arranged that when alight was raised at night, all the guards should rise, and inflicted a penalty on those who did not observe it. Hissicratus, the Athenian, slew a guard who was sleeping, saying he was leaving him as he had found him. Those who are besieged have had various ways of sending news to their friends, and in order not to send embassies by voice, wrote letters in cipher, and concealed them in various ways. The ciphers are according to the desires of whoever arranges them, the method of concealment is varied. Some have written inside the scabbard of a sword. Others have put these letters inside raw bread, and then baked it, and gave it as food to him who brought it. Others have placed them in the most secret places of the body. Others have put them in the collar of a dog known to him who brings it. Others have written ordinary things in a letter, and then have written with water (invisible ink) between one line and another, which afterwards by wetting or scalding (caused) the letter to appear. This method has been very astutely observed in our time, where some wanting to point out a thing which was to be kept secret to their friends who lived inside a town, and not wanting to trust it in person, sent communications written in the customary manner, but interlined as I mentioned above, and had them hung at the gates of a Temple; which were then taken and read by those who recognised them from the countersigns they knew. Which is a very cautious method, because whoever brings it can be deceived by you, and you do not run any danger. There are infinite other ways by which anyone by himself likewise can find and read them. But one writes with more facility to the besieged than the besieged do to friends outside for the latter can not send out such letters except by one who leaves the town under the guise of a fugitive, which is a doubtful and dangerous exploit when the enemy is cautious to a point. But as to those that are sent

inside, he who is sent can, under many pretexts, go into the

capture them. Pyrrhus, when he was waging war in Sclavonia,

in one of the Chief Cities of that country, where a large force

had been brought in to garrison it, feigned to be desperate of

camp that is besieged, and from here await a convenient opportunity to jump into the town.

But let us come to talk of present captures, and I say that, if they occur when you are being fought in your City, which is not arranged with ditches inside, as we pointed out a little while ago, when you do not want the enemy to enter by the breaks in the wall made by artillery [as there is no remedy for the break which it makes], it is necessary for you, while the artillery is battering, to dig a ditch inside the wall that is being hit, at least thirty arm lengths wide, and throw all (the earth) that is excavated toward the town, which makes embankments and the ditch deeper: and you must do this quickly, so that if the wall falls, the ditch will be excavated at least five or six arm lengths deep. While this ditch is being excavated, it is necessary that it be closed on each side by a block house. And if the wall is so strong that it gives you time to dig the ditches and erect the block houses, that part which is battered comes to be stronger than the rest of the City, for such a repair comes to have the form that we gave to inside ditches. But if the wall is weak and does not give you time, then there is need to show virtu, and oppose them with armed forces, and with all your strength. This method of repair was observed by the Pisans when you went to besiege them, and they were able to do this because they had strong walls which gave them time, and the ground firm and most suitable for erecting ramparts and making repairs. Which, had they not had this benefit, would have been lost. It would always be prudent, therefore, first to prepare yourself, digging the ditches inside your City and throughout all its circuit, as we devised a little while ago; for in this case, as the defenses have been made, the enemy is awaited with leisure and safety. The ancients often occupied towns with tunnels in two ways: either they dug a secret tunnel which came out inside the town and through which they enter edit, in the way in which the Romans took the City of the Veienti:or, by tunnelling they undermined a wall, and caused it to be ruined. This last method is more effective today, and causes Cities located high up to be weaker, for they can be undermined more easily, and then when that powder which ignites in an instant is placed inside those tunnels, it not only ruins the wall, but the mountains are opened, and the fortresses are entirely disintegrated into several parts. The remedy for this is to build on a plain, and make the ditch which girds your City so deep, that the enemy can not excavate further below it without finding water, which is the only enemy of these excavations. And even if you find a knoll within the town that you defend, you cannot remedy it otherwise than to dig many deep wells within your walls which are as outlets to those excavations which the enemy might be able to arrange against it. Another remedy is to make an excavation opposite to where you learn he is excavating: which method readily impedes him, but is very difficult to foresee, when you are besieged by a cautious enemy. Whoever is besieged, above all, ought to take care not to be attacked in times of repose, as after having engaged in battle, after having stood guard, that is, at dawn, the evening between night and day, and, above all at dinner time, in which times many towns have been captured, and many armies ruined by those inside. One ought, therefore, to be always on guard with diligence on every side, and in good part well armed. I do not want to miss telling you that what makes defending a City or an encampment difficult, is to have to keep all the forces you have in them disunited; for the enemy being able all together to as sault you at his discretion, you must keep every place guarded on all sides, and thus he assaults you with his entire force, and you defend it with part of yours. The besieged can also be completely overcome, while those outside cannot unless repulsed; whence many who have been besieged either in their encampment or in a town. although inferior in strength, have suddenly issued forth with all their forces, and have overcome the enemy. Marcellus did this at Nola, and Caesar did this in Gaul, where his encampment being as saulted by a great number of Gauls, and seeing he could not defend it without having to divide this forces into several parts, and unable to stay within the stockade with the driving attack of the enemy, opened the encampment on one side, and turning to that side with all his forces, attacked them with such fury, and with such virtu, that he overcame and defeated them. The constancy of the besieged has also often displeased and dismayed the besieger. And when Pompey was affronting Caesar, and Caesar's army was suffering greatly from hunger, some of his bread was brought to Pompey, who, seeing it made of grass, commanded it not be shown to his army in order not to frighten it, seeing what kind of enemies he had to encounter. Nothing gave the Romans more honour in the war against Hannibal, as their constancy; for, in whatever more inimical and adverse fortune. they never asked for peace, (and)never gave any sign of fear: rather, when Hannibal was around Rome, those fields on which he had situated his quarters were sold at a higher price than they would ordinarily have been sold in other times; and they were so obstinate in their enterprises, that to defend Rome, they did not leave off attacking Capua, which was being besieged by the Romans at the same time Rome was being besieged.

have been able to understand and consider by yourselves; none the less, I have done this [as I also told you today] to be able to show you, through them, the better kind of training, and also to satisfy those, if there should be any, who had not had that opportunity to learn, as you have. Nor does it appear tome there is anything left for me to tell you other than some general rules, with which you should be very familiar: which are these. What benefits the enemy, harms you; and what benefits you, harm the enemy. Whoever is more vigilant in observing the designs of the enemy in war, and endures much hardship in training his army, will incur fewer dangers, and can have greater hope for victory. Never lead your soldiers into an engagement unless you are assured of their courage, know they are without fear, and are organised, and never make an attempt unless you see they hope for victory. It is better to defeat the enemy by hunger than with steel; in such victory fortune counts more than virtu. No proceeding is better than that which you have concealed from the enemy until the time you have executed it. To know how to recognise an opportunity in war, and take it, benefits you more than anything else. Nature creates few men brave, industry and training makes many. Discipline in war counts more than fury. If some on the side of the enemy desert to come to your service, if they be loyal, they will always make you a great acquisition; for the forces of the adversary diminish more with the loss of those who flee, than with those who are killed, even though the name of the fugitives is suspect to the new friends, and odious to the old. It is better in organising an engagement to reserve great aid behind the front line, than to spread out your soldiers to make a greater front. He is overcome with difficulty, who knows how to recognise his forces and those of the enemy. The virtu of the soldiers is worth more than a multitude, and the site is often of more benefit than virtu. New and speedy things frighten armies, while the customary and slow things are esteemed little by them: you will therefore make your army experienced, and learn (the strength) of a new enemy by skirmishes, before you come to an engagement with him. Whoever pursues a routed enemy in a disorganised manner, does nothing but become vanquished from having been a victor. Whoever does not make provisions necessary to live (eat), is overcome without steel. Whoever trusts more in cavalry than in infantry, or more in infantry than in cavalry, must settle for the location. If you want to see whether any spy has come into the camp during the day, have no one go to his quarters. Change your proceeding when you become aware that the enemy has foreseen it. Counsel with many on the things you ought to do and confer with few on what you do afterwards. When soldiers are confined to their quarters, they are kept there by fear or punishment; then when they are led by war, (they are led) by hope and reward. Good Captains never come to an engagement unless necessity compels them, or the opportunity calls them. Act so your enemies do not know how you want to organise your army for battle, and in what ever way you organise them, arrange it so that the first line can be received by the second and by the third. In a battle, never use a company for some other purpose than what you have assigned it to, unless you want to cause disorder. Accidents are remedied with difficulty, unless you quickly take the facility of thinking. Men, steel, money, and bread, are the sinews of war; but of these four, the first two are more necessary, for men and steel find find money and bread, but money and bread do not find men and steel. The unarmed rich man is the prize of the poor soldier. Accustom your soldiers to despise delicate living and luxurious clothing. This is as much as occurs to me generally to remind you,

and I know I could have told you of many other things in my discussion, as for example, how and in how many ways the ancients organised their ranks, how they dressed, and how they trained in many other things: and to give you many other particulars, which I have not judged necessary to narrate, as much because you are able to see them, as because my intention has not been to show you in detail how the ancient army was created, but how an army should be organised in these times, which should have more virtu than they now have. Whence it does not please me to discuss the ancient matters further than those I have judged necessary to such an introduction. I know I should have enlarged more on the cavalry, and also on naval warfare; for whoever defines the military, says, that it is an army on land and on the sea, on foot and on horseback. Of naval matters, I will not presume to talk, not because of not being in formed, but because I should leave the talk to the Genoese and Venetians, who have made much study of it, and have done great things in the past. Of the cavalry, I also do not want to say any thing other than what I have said above, this part being [as I said] less corrupted. In addition to this, if the infantry, who are the nerve of the army, are well organised, of necessity it happens that good cavalry be created. I would only remind you that whoever organises the military in his country, so as to fill(the quota) of cavalry, should make two provisions: the one, tha the should distribute horses of good breed throughout his countryside, and accustom his men to make a round-up of fillies, as you do in this country with calves and mules: the

Copyright © 2018 by Lord Henfield, Guildford Scientific Press PAGE 3396 other, [so that the round-up men find a buyer] I would prohibit anyone to keep mules who did not keep a horse; so that whoever wanted to keep a mount only, would also be constrained to keep a horse; and, in addition, none should be able to dress in silk, except whoever keeps a horse. I understand this arrangement has been done by some Princes of our times, and to have resulted in an excellent cavalry being produced in their countries in a very brief time. About other things, how much should be expected from the cavalry. I will go back to what I said to you today, and to that which is the custom. Perhaps you will also desire to learn what parts a Captain ought to have. In this, I will satisfy you in a brief manner; for I would not knowingly select any other man than one who should knowhow to do all those things which we have discussed today. And these would still not be enough for him if he did not know how to find them out by himself, for no one without imagination was ever very great in his profession; and if imagination makes for honour in other things, it will, above all, honour you in this one. And it is to be observed, that every creation (imagination), even though minor, is celebrated by the writers, as is seen where they praised Alexander the Great, who, in order to break camp more secretly, did not give the signal with the trumpet, but with a hat on the end of a lance. He is also praised for having ordered his soldiers, when coming to battle with the enemy, to kneel with the left foot (knee) so that they could more strongly with stand the attack (of the enemy); which not only gave him victory, but also so much praise that all the statues erected in his honour show him in that pose.

But as it is time to finish this discussion, I want to return to the subject, and so, in part, escape that penalty which, in this town, custom decrees for those who do not return. If you remember well, Cosimo, you said to me that I was, on the one hand, an exalter of antiquity, and a censurer of those who did not imitate them in serious matters, and, on the other (hand), in matters of war in which I worked very hard, I did not imitate them, you were unable to discover the reason: to that I replied, that men who want to do something must first prepare themselves to knowhow to do it in order to be able afterwards to do it when the occasion permits it. whether or not I would know how to bring the army to the ancient ways, I would rather you be the judge, who have heard me discuss on this subject at length; whence you have been able to know how much time I have consumed on these thoughts, and I also believe you should be able to imagine how much desire there is in me to put them into effect. Which you can guess, if I was ever able to do it, or if ever the opportunity was given to me. Yet, to make you more certain, and for my greater justification, I would like also to cite you the reasons, and in part, will observe what I promised you, to show you the ease and the difficulty that are present in such imitation. I say to you, therefore, that no activity among men today is easier tore store to its ancient ways than the military; but for those only who are Princes of so large a State, that they are able to assemble fifteen or twenty thousand young men from among their own subjects. On the other hand, nothing is more difficult than this to those who do not have such a convenience. And, because I want you to under stand this part better, you have to know that Captains praised are of two kinds. The one includes those, who, with an army (well) ordered through its own natural discipline, haved one great things, such as were the greater part of the Roman Citizens, and others, who have led armies, who have not had any hardship in maintaining them good, and to see to it that they were safely led. The other includes those who not only had to overcome the enemy, but before they came to this, had been compelled to make their army good and well ordered, (and) who, without doubt, deserve greater praise that those others merited who with a army which was (naturally) good have acted with so much virtu. Such as these were Pelopidas, Epaminondas, Tullus Hostilius, Phillip of Macedonia father of Alexander, Cyrus King of the Persians, and Gracchus the Roman. All these had first to make the army good, and then fight with it. All of these were able to do so, as much by their prudence, as by having subjects capable of being directed in such practices. Nor would it have been possible for any of them to accomplish any praiseworthy deed, no matter how good and excellent they might have been, should they have been in an alien country, full of corrupt men, and not accustomed to sincere obedience. It is not enough, therefore, in Italy, to govern an army already trained, but it is necessary first to know how to do it, and then how to command it. And of these, there need to be those Princes, who because they have a large State and many subjects, have the opportunity to accomplish this. Of whom, I cannot be one, forI have never commanded, nor can I command except armies of foreigners, and men obligated to others and not to me. Whether or not it is possible to introduce into them (those Princes) some of the things we discussed today. I want to leave to your judgement. Would I make one of these soldiers who practice today carry more arms than is customary, and in addition, food for two or three days, and a shovel? Should I make him dig, or keep him many hours everyday under arms in feigned exercises, so that in real (battles)afterward he could be of value to me? Would

they abstain from gambling, lasciviousness, swearing, and insolence, which they do daily? Would they be brought to so much discipline, obedience, and respect, that a tree full of apples which should be found in the middle of an encampment, would be left intact, as is read happened many times in the ancient armies? What can I promise them, by which they well respect, love, or fear me, when, with a war ended, they no longer must come to me for anything? Of what can I make them ashamed, who are born and brought up without shame?By what Deity or Saints do I make them take an oath? By those they adore, or by those they curse? I do not know any whom they adore; but I well know that they curse them all. How can I believe they will observe the promises to those men, for whom they show their contempt hourly? How can those who deprecate God, have reverence for men? What good customs, therefore, is it possible to instill in such people? And if you should tell me the Swiss and the Spaniards are good, I should confess they are far better than the Italians:but if you will note my discussion, and the ways in which both proceeded, you will see that there are still many things missing among them (the Swiss and Spaniards) to bring them up to the perfection of the ancients. And the Swiss have been good from their natural customs, for the reasons I told you today, and the others (Spaniards)from necessity; for when they fight in a foreign country, it seems to them they are constrained to win or die, and as no place appeared to them where they might flee, they became good. But it is a goodness defective in many parts, for there is nothing good in them except that they are accustomed to await the enemy up to the point of the pike and of the sword. Nor would there be anyone suitable to teach them what they lack, and much less anyone who does not(speak) their language.

But let us turn to the Italians, who, because they have not wise Princes, have not produced any good army; and because they did not have the necessity that the Spaniards had, have not undertaken it by themselves, so that they remain the shame of the world. And the people are not to blame, but their Princes are, who have been castigated, and by their ignorance have received a just punishment, ignominously losing the State, (and) without any show of virtu. Do you want to see if what I tell you is true? Consider how many wars have been waged in Italy, from the passage of King Charles(of France) until today; and wars usually make men warlike and acquire reputations; these, as much as they have been great (big)and cruel, so much more have caused its members and its leaders to lose reputation. This necessarily points out, that the customary orders were not, and are not, good, and there is no one who knowhow to take up the new orders. Nor do you ever believe that reputation will be acquired by Italian arms. except in the manner I have shown, and by those who have large States in Italy, for this custom can be instilled in men who are simple, rough, and your own, but not to men who are malignant, have bad habits, and are foreigners. And a good sculptor will never be found who believes he can make a beautiful statue from a piece of marble poorly shaped, even though it may be a rough one. Our Italian Princes, before they tasted the blows of the ultramontane wars, believed it was enough for them to know what was written, think of a cautious reply, write a beautiful letter, show wit and promptness in his sayings and in his words, know how to weave a deception, ornament himself with gems and gold, sleep and eat with greater splendor than others, keep many lascivious persons around, conduct himself avariciously and haughtily toward his subjects, become rotten with idleness, hand out military ranks at his will, express contempt for anyone who may have demonstrated any praiseworthy manner, want their words should be the responses of oracles; nor were these little men aware that they were preparing themselves to be the prey of anyone who assaulted them. From this, then, in the year one thousand four hundred ninety four (1494), there arose the great frights, the sudden flights, and the miraculous (stupendous) losses: and those most powerful States of Italy were several times sacked and despoiled in this manner. But what is worse is, that those who remained persist in the same error, and exist in the same disorder: and they do not consider that those who held the State anciently, had done all those things we discussed, and that they concentrated on preparing the body for hardships and the mind not to be afraid of danger. Whence it happened that Caesar, Alexander, and all those excellent men and Princes, were the first among the combatants, went around on foot, and even if they did lose their State, wanted also to lose their lives: so that they lived and died with virtu. And if they, or part of them, could be accused of having too much ambition to rule, there never could be found in them any softness or anything to condemn, which makes men delicate and cowardly. If these things were to be read and believed by these Princes, it would be impossible that they would not change their way of living, and their countries not change in fortune. And as, in the beginning of our discussion, you complained of your organisation, I tell you, if you had organised it as we discussed above, and it did not give a good account for itself, then you have reason to complain; but if it is not organised and trained as I have said, (the Army) it can have reason to

complain of you, who have made an abortion, and not a perfect figure (organisation). The Venetians also, and the Duke of Ferrara, begun it, but did not pursue it; which was due to their fault, and not of their men. And I affirm to now, that any of them who have States in Italy today, will begin in this way, he will be the Lord higher than any other in this Province; and it will happen to his State as happened to the Kingdom of the Macedonians, which, coming under Phillip, who had learned the manner of organising the armies from Epaminondas, the The ban, became, with these arrangements and practices [while the rest of Greece was in idleness, and attended to reciting comedies] so powerful, that in a few years, he was able to occupy it completely, and leave such a foundation to his son, that he was able to make himself Prince of the entire world. Whoever disparages these thoughts, therefore, if he be a Prince, disparages his Principality, and if he be a Citizen, his City. And I complain of nature, which either ought to make me a recogniser of this, or ought to have given me the faculty to be able to pursue it. Nor, even today when I am old, do I think I can have the opportunity: and because of this, I have been liberal with you, who, being young and qualified, when the things I have said please you, could, at the proper time, in favour of your Princes, aid and counsel them. I do not want you to be afraid or mistrustful of this, because this country appears to be born (to be destined) to resuscitate the things which are dead, as has been observed with Poetry, Painting, and Sculpture. But as for waiting for me, because of my years, do not rely on it. And. truly. if in the past fortune had conceded to me what would have sufficed for such an enterprise, I believe I would, in a very brief time, have shown the world how much the ancient institutions were of value, and, without doubt, I would have enlarged it with glory, or would have lost it without shame.

> LETTER ON SECRET MARK The Mar Saba Letter A Letter Attributed to Clement of Alexandria Found at the Mar Saba monastary, Israel Translation: Morton Smith, 1973 Estimated Range of Dating: 1700-1800 A.D.

(In 1958, a hand-written copy of an unknown letter of Clement of Alexandria (c. 150–215 AD) was found at the Mar Saba monastary which is 20 km / 13 mi south-east of Jerusalem. It was discovered by Morton Smith in 1958 when he, as a graduate student of Columbia University, was cataloguing the manuscript collection of the Mar Saba Monastery south of Jerusalem. Morton Smith made a formal announcement of its discovery in 1960. The letter copy was written down by an unknown person, perhaps a student, into 3 empty pages at the end of a printed book, Isaac Voss' 1646 edition of the Epistolae genuinae S. Ignatii Martyris, the "Genuine Letters of Ignatius of Antioch."

Smith made some black and white photographs of that copy. The book itself with the hand-written letter copy was subsequently transferred to the library of the Greek Orthodox Church in Jerusalem, and sometime after 1990, it was lost.

What follows is Morton Smith's translation as it appears in his book Clement of Alexandria and a Secret Gospel of Mark (Harvard University Press, 1973). According to script analysis, the copy was written in 18th century Greek minuscule. In his introduction in The Complete Gospels, Stephen Patterson notes: "The handwriting can be dated to around 1750. It caused interest not because Clement of Alexandria talks in it "to Theodore" about a dispute with the Carpocratians, an heterodox Christian sect, but because it mentions an unknown Secret Gospel of Mark!

The revelation of the letter caused a sensation at the time but was soon met with accusations of forgery and misrepresentation. Early discussion of it was marred by accusations of forgery and fraud, no doubt owing in part to its controversial comments. Although most Clement scholars have accepted the letter as genuine, there is no consensus on the authenticity among biblical scholars, and the opinion is split.

For many years it was thought that only Smith had seen the manuscript. However, in 2003 Guy Stroumsa reported that he and a group of other scholars saw it in 1976. Stroumsa, along with the late Hebrew University professors David Flusser and Shlomo Pines and Greek Orthodox Archimandrite Meliton, went to Mar Saba to look for the book. With the help of a Mar Saba monk, they relocated it where Smith presumably had left it 18 years earlier, and with "Clement's letter written on the blank pages at the end of the book". Stroumsa, Meliton, and company determined that the manuscript might be safer in Jerusalem than in Mar Saba. They took the book back with them, and Meliton subsequently brought it to the Patriarchate library. The group looked into having the ink tested but the only entity in the area with such technology was the Jerusalem police. Meliton did not want to leave the manuscript with the police, so no test was taken. Stroumsa published his account upon

learning that he was the "last known living Western scholar" to have seen the letter.

Subsequent research has uncovered more about the manuscript [see: Secret Gospel of Mark, Wikipedia]. Around 1977, librarian Father Kallistos Dourvas removed the two pages containing the text from the book for the purpose of photographing and re-cataloguing them. Colour photographs were made in 1983 by Dourvas at a photo studio. However, the re-cataloguing obviously never happened. Kallistos Dourvas gave colour photographs of the manuscript to Olympiou, and Hedrick and Olympiou published them in The Fourth R in 2000. The letter's whereabouts are unknown.

In the letter, addressed to one otherwise unknown Theodore (Theodoros), Clement says that "when Peter died a martyr, Mark [i.e. Mark the Evangelist] came over to Alexandria, bringing both his own notes and those of Peter, from which he transferred to his former book [i.e. the Gospel of Mark] the things suitable to whatever makes for progress toward knowledge." He further says that Mark left this extended version, known today as the Secret Gospel of Mark, "to the church in Alexandria, where it even yet is most carefully guarded, being read only to those who are being initiated into the great mysteries." Clement quotes two passages from this Secret Gospel of Mark, where Jesus in the longer passage is said to have raised a rich young man from the dead in Bethany, a story which shares many similarities with the story of the raising of Lazarus in the Gospel of John.

The text of the letter attributed to Clement of Alexandria about a "Secret Gospel of Mark" is presented in a simple paragraphed format and in the original annotated manuscript version.)

MAR SABA LETTER PAGE 1 [Folio 1 recto] From the letters of the most holy Clement, the author of the Stromateis.

To Theodore.

You did well in silencing the unspeakable teachings of the Carpocrations. For these are "wandering stars" referred to in the prophecy, who wander from the narrow road of the commandments into a boundless abyss of the carnal and bodily sins. For, priding themselves in knowledge, as they say, "of the deep things of Satan, they do not know that they are casting themselves away into "the netherworld of darkness" of falseness, and boasting that they are free, they have become slaves of servile desires. Such men are to be opposed in all ways and alltogether. For, even if they should say something true, one who loves the truth should not, even so, agree with them. For not all true things are the truth, nor should that truth which merely seems true according to human opinions be prefered to the true truth, that according to the faith

Now of the things they keep saying about the divinely inspired Gospel according to Mark, some are altogether falsifications, and others, even if they do contain some true elements, nevertheless are not reported truely. For the true things being mixed with inventions, are falsified, so that, as the saying goes, even the salt loses its savor.

As for Mark, then, during Peter's stay in Rome he wrote an account of the Lord's doings, not, however, declaring all of them, nor yet hinting at the secret ones, but selecting what he thought most useful for increasing the faith of those who were being instructed. But when Peter died a martyr, Mark came over to Alexandria, bringing both his own notes and those of Peter, from which he transferred to his former books the things suitable to whatever makes for progress toward knowledge. Thus he composed a more spiritual Gospel for the use of those who were being perfected. Nevertheless, he yet did not divulge the things not to be uttered, nor did he write down the hierophantic teaching of the Lord, but to the stories already written he added yet others and, moreover, brought in certain sayings of which he knew the interpretation would, as a mystagogue, lead the hearers into the innermost sanctuary of truth hidden by seven veils. Thus, in sum, he prepared matters, neither grudgingly nor incautionously, in mv

MAR SABA LETTER PAGE 2 [Folio 1 verso]

opinion, and, dying, he left his composition to the church in 1, verso Alexandria, where it even yet is most carefully guarded, being read only to those who are being initated into the great mysteries.

But since the foul demons are always devising destruction for the race of men, Carpocrates, instructed by them and using deceitful arts, so enslaved a certain presbyter of the church in Alexandria that he got from him a copy of the secret Gospel, which he both interpreted according to his blasphemous and carnal doctrine and, moreover, polluted, mixing with the spotless and holy words utterly shameless lies. From this mixture is withdrawn off the teaching of the Carpocratians.

To them, therefore, as I said above, one must never give way; nor, when they put forward their falsifications, should one concede that the secret Gospel is by Mark, but should even deny it on oath. For, "For not all true things are to be

Copyright © 2018 by Lord Henfield, Guildford Scientific Press PAGE 3398

said to all men". For this reason the Wisdom of God, through Solomon, advises, "Answer the fool with his folly,", teaching that the light of the truth should be hidden from those who are mentally blind. Again it says, "From him who has not shall be taken away" and "Let the fool walk in darkness". But we are "children of Light" having been illuminated by "the dayspring" of the spirit of the Lord "from on high", and "Where the Spirit of the Lord is", it says, "there is liberty", for "All things are pure to the pure". To you, therefore, I shall not hesitate to answer the

To you, therefore, I shall not hesitate to answer the questions you have asked, refuting the falsifications by the very words of the Gospel. For example, after "And they were in the road going up to Jerusalem" and what follows, until "After three days he shall arise", the secret Gospel brings the following material word for word:

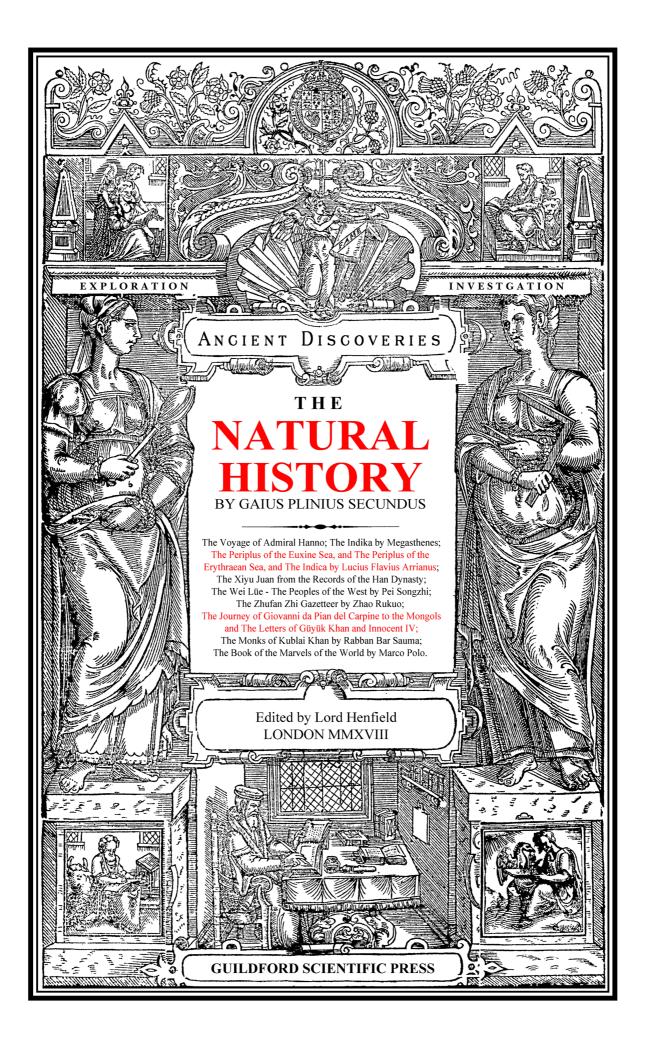

"And they come into Bethany. And a certain woman whose brother had died was there. And, coming, she prostrated herself before Jesus and says to him, "son of David, have mercy on me". But the disciples rebuked her. And Jesus, being angered, went off with her into the garden where

MAR SABA LETTER PAGE 3 [Folio 2 recto]

The tomb was, and straightway, going in where the youth was, he stretched forth his hand and raised him, seizing his hand. But the youth, looking upon him, loved him and began to beseech him that he might be with him. And going out of the tomb they came into the house of the youth, for he was rich. And after six days Jesus told him what to do and in the evening the youth comes to him, wearing a linen cloth over his naked body. And he remained with him that night, for Jesus thaught him the mystery of the Kingdom of God. And thence, arising, he returned to the other side of the Jordan."

And these words follow the text, "And James and John come to him" and all that section. But "naked man with naked man" and the other things about which you wrote, are not found.

And after the words,"And he comes into Jericho," the secret Gospel adds only, "And the sister of the youth whom Jesus loved and his mother and Salome were there, and Jesus did not receive them." But many other things about which you wrote both seem to be and are falsifications. Now the true explanation and that which accords with the true philosophy... [Here the document ends.]

EXPLORATION ACCOUNTS AND THE EXCHANGE OF RELIGIOUS AND PHILOSOPHICAL IDEAS

(One may think that the Grand Bible goes off topic with this section on discoveries. Exploration and migration go hand in hand. For at least 2 or 3 million years, humans explored new areas to feed their families. Homo Erectus then burst out of Africa to Asia and Europe. In Europe and the west of Asia they adapted to the cold climate and changed into humans we call Neanderthals. They existed for hundreds of thousands of years and spread also to the East of Asia. About 50,000 years ago, a new group of humans, the Cro-Magnons, modern humans, again, burst out of Africa, intermarried with Neanderthals, and this new and climatehardened bread spread out to all the continents.

Historians say that exploration have had its most dramatic rise during the Age of Discovery when European explorers sailed and charted much of the rest of the world. That, however, is not the entire truth. History books cover mainly wars, politics, catastrophes, and some daily life. Exploring and migrating people have had a much more dramatic impact on other civilisations than most of us would expect. Whether the explorers have been traders, merchants, scientists, or just people who look for a better life, they all have one thing in common. Each of them brings his own language into the new lands and with it all the baggage of thoughts and beliefs that he once has learned via his mother tongue. This includes also religion, habits, attitudes and traditions, good and bad. This is why we ought to pay attention to explorers and their mind set for they are the pioneers of the newcomers.

Phoenician Explorations

The Phoenicians (also known as Canaanites, may be, from 2000 BC, surely from 1550 BC to 300 BC) traded throughout the Mediterranean Sea and Asia Minor though many of their routes are still unknown today. They were accompanied by people whom the Egyptians called Hyksos [invaders from foreign lands], and who called themselves Habiru or Apiru [meaning "Hebrew"]. The presence of tin in some Phoenician artifacts suggests that they may have traveled to Britain. According to Virgil's Aeneid and other ancient sources, the legendary Queen Dido was a Phoenician from Tyre who sailed to North Africa and founded the city of Carthage.

The Phoenicians had a civilisation that existed in the coastal region of the Levant as early as the 3rd millennium BC. They were not a significant culture until about 1100 BC. By the 9th century BC the Phoenicians had became the dominant culture in the Mediterranean Sea. They grew wealthy through trade. Instead of war they used trade agreements and alliances to expand their colonies. The Phoenicians developed advanced navigational skills and had the best ships in the Mediterranean built in a unit construction system. They explored over land routes and developed caravan routes to trade with distant places. Carthage got its start as a Phoenician colony on the north coast of Africa. It grew to be their largest and most successful colony.

Gradually the western Mediterranean Phoenician colonies all came under the control of Carthage. The Carthaginians were explorers too. Two major explorations are are mentioned by early writers. Both took place around 500 BC. Pliny the Elder wrote that Carthage sent an explorer named Himilco to explore the remote parts of Europe. The report, or periplus (sailing record), has not survived but other early writers have seen it. He had as many as 60 ships in his fleet. He would have traveled along the Iberian Peninsula up the coast of Gaul. Avienus, a Roman writer of the 4th century AD, wrote about the expedition. Himilco moved north from Brittany to the British Isles. It is likely he was looking for tin, a rare metal at the time. He reached a land called Latin: insula sacra, "The Holy Island", generally believed to be Ireland.

Two major explorations are are mentioned by early writers. About the same time, The Carthaginean Phoenicians sent Admiral Hanno [also known as Hanno the Navigator, c. 500 BC, a navigator from Carthage who explored the Western Coast of Africa. Hanno the Navigator was sent to explore the western coast of Africa. His periplus has survived and is one of the earliest surviving manuscripts. The periplus records landmarks, ports and saling distance between them. It is a guide for other ship captains to follow. Hanno's 60 ships moved south along the African coast. He may have reached as far as an island off the coast of Sierra Leone. There is no record of any other explorations of the west Africa coast until the time of Henry the Navigator, the Portuguese explorer.

Greek and Roman Explorations

The Greek explorer from Marseille, Pytheas of Massalia (c. 380–310 BC) was the first to circumnavigate Great Britain, explore Germany, and reach Thule (most commonly thought to be the Shetland Islands or Iceland). He made a voyage to northwestern Europe in about 325 BC. Pytheas was the first person on record to describe the Midnight Sun and the Arctic polar ice. His account of the tides is the earliest known to suggest the Moon as their cause.

Under General Gaius Julius Caesar, Romans conquered Gallia [France], went deep into Germany, and built the first outposts in Britain. Under Emperor Augustus [Gaius Julius Caesar Octavianus, Julius Caesars nephew, adopted son and heir], they reached and explored all the Baltic Sea. The Romans organised expeditions to cross the Sahara desert with five different routes: (1st) through the western Sahara, toward the River Niger and actual Timbuktu; (2nd) through the Tibesti mountains, toward Lake Chad and actual Nigeria: (3rd) through the Nile river, toward actual Uganda; (4th) through the western coast of Africa, towards the Canary Islands and the Cape Verde islands; (5th) through the Red Sea, toward actual Somalia and perhaps Tanzania. All these expeditions were supported by legionaries and had mainly a commercial purpose. Only the one done by emperor Nero seemed to be a preparative for the conquest of Ethiopia or Nubia: in 62 AD two legionaries explored the sources of the River Nile. One of the main reasons of the explorations was to get gold using the camel to transport it. The explorations near the African western and eastern coasts were supported by Roman ships and deeply related to the naval commerce (mainly toward the Indian Ocean). The Romans also organised several explorations into Northern Europe, and explored as far as China in Asia.

From 30 BC to 640 AD: With the acquisition of Ptolemaic Egypt, The Romans begin trading with India. The Empire now has a direct connexion to the Spice trade Egypt had established beginning in 118 BC. Between 100-166 AD, the Roman-Chinese relations begin on a larger scale. Claudius Ptolemy writes of the Golden Chersonese (i.e. Malay Peninsula) and the trade port of Kattigara, now identified as Óc Eo in northern Vietnam, then part of Jiaozhou, a province of the Chinese Han Empire. The Chinese historical texts describe Roman embassies, from a land they called Dagin or Da Qin [speak: Da Chin], respectfully meaning "Greater Chinese Empire." In the 2nd century AD, Roman traders reach Thailand, Cambodia, Sumatra, and Java. In 161 AD, an embassy from Roman Emperor Antoninus Pius or his successor Marcus Aurelius [who regned together] reaches Chinese Emperor Huan of Han at his capital Luoyang. In 226 AD, a Roman diplomat or merchant lands in northern Vietnam and visits Nanjing [meaning "South Capital"], China and the court of Sun Quan, ruler of Eastern Wu.

Chinese exploration of Central Asia

Following the spectacular conquests of Alexander the Great, the Chinese were forced to pay attention to the new political situation. Persia had changed over night into a Greek Empire streching far into the northwest of India and into the Ferghana Valley, very nearby Kashgar, the westernmost outpost of the Chinese sphere of influence. During the 2nd century BC, the Han Dynasty explored much of the Eastern Northern Hemisphere. Starting in 139 BC, the Han diplomat Zhang Oian traveled west in an unsuccessful attempt to secure an alliance with the Da Yuezhi against the Xiongnu (the Yuezhi had been evicted from Gansu by the Xiongnu in 177 BC); however, Zhang's travels discovered entire countries which the Chinese were unaware of, including the remnants of the conquests of Alexander the Great (r. 336-323 BC). He had traveled as far as the Indus River in northwestern India. When Zhang returned to China in 125 BC, he reported on his visits to Dayuan ("Great Ionia," the "Great Greek Empire, Fergana), Kangju (Sogdiana), and Daxia (The formerly the Greek Kingdom of Bactria which had just been subjugated by the Da Yuezhi, the "White Huns."). Zhang described Dayuan and Daxia as agricultural and urban countries like China, and although he did not venture there, described Shendu (the Indus River valley of Northwestern India) and Anxi (Arsacid territories) further west.

Austronesian Explorations

Austronesians [Polynesians if they live in the East] were a maritime people, who populated and explored the central and south Pacific for around 5,000 years, up to about 1280 when they discovered New Zealand. The key invention to their successful exploration was the outrigger double-canoe, the catamaran [Tamil: kattumaram "tied timber or canoe"], which provided a swift and stable platform for carrying goods and people. Mathematical modelling based on DNA genome studies, using state-of-the-art techniques, have shown that a large number of Austronesian migrants (100-200), including women, arrived in New Zealand around the same time, in about 1280 AD. Austronesians may have used the prevailing north easterly trade winds to reach New Zealand in about three weeks. They did the very same technique to reach the Easter Islands far in the East and Madagascar far in the West, just off the coast of eastern Africa. Austronesians had all sea routes in the Pacific as well as the Indian Ocean in their hands. They used sea maps denoting sea currents, main winds, locations, and the distances of one location to another.

Viking Explorations

From about 800 AD to 1040 AD, the Vikings explored Iceland and much of the Western Northern Hemisphere via rivers and oceans. For example, it is known that the Norwegian Viking explorer, Erik the Red (950–1003), sailed to and settled in Greenland after being expelled from Iceland, while his son, the Icelandic explorer Leif Ericson (980–1020), reached Newfoundland and the nearby North American coast, and is believed to be the first European to land in North America.

Chinese Exploration of the Indian Ocean

The Chinese explorer, Wang Dayuan (fl. 1311–1350) made two major trips by ship to the Indian Ocean. During 1328– 1333, he sailed along the South China Sea and visited many places in Southeast Asia and reached as far as South Asia, landing in Sri Lanka and India, and he even went to Australia. Then in 1334–1339, he visited North Africa and East Africa. Later, the Chinese admiral Zheng He (1371–1433) made seven voyages to Arabia, East Africa, India, Indonesia and Thailand.

What follows now are first-hand eye witness accounts. We clearly can read in them how important the rule of religion is in thoughts of those who left these documents behind for us to discover; that applies even for the merchant Marco Polo.)

THE VOYAGE OF HANNO COMMANDER OF THE CARTHAGINIANS

or The Periplous of Captain Hanno or The Circumnavigation of Africa by Phoenicians in Egyptian Service recorded by Herodotus of Halikarnassos Ist Source: Palatinus Graecus 398, University Library of Heidelberg, Germany. 2nd Source: Codex Vatopedinus 655, Vatopedi monastery, Mount Athos, Greece Translation: Two versions, Anonymus. Estimated Range of Dating: c. 480 – 425 B.C.

(In his history, Herodotus recounts the remarkable circumnavigation of Africa by Phoenicians in Egyptian service. The Phoenicians of Carthage also made expeditions down the west coast of Africa. The text is a description of one of these explorations. Hanno the Navigator [Punic-Phoenician: H-N-' [guttural H like in Scots "loch"]; Greek: Hannon) was a Carthaginian explorer of the sixth or fifth century BC, best known for his naval exploration of the western coast of Africa. The only source of his voyage is a Greek periplous, a journey description. The periplus is the sole survivor of a larger Phoenician text. This is due to the Roman custom to systematically destroy any written material of their enemies. It happened likewise with any records of, by, or about the druids in Britain and all texts of the Persian Zoroastrians they could find, and texts of all other enemies. This habit was continued by the Roman Christians who destroyed all texts of the Ebionites, Essenes, Marcionites, Arians, and all other texts. All texts of the Jewish Messianic Movement (that engulfed the Empire in total war from 66 to 73 AD) were also distroyed. This is the reason why archaeologist consider finds such the Dead Sea Scroll from Qumran, the Nag Hammadi Library, any cuneiform or Papyrus book a fortunate event.

According to some modern analyses of his route, Hanno's expedition have taken him no further than southern Morocco, according to conservative scholars. However, according to modern scholars, Hanno's expedition could have reached as far south as Gabon or Kongo.

Expedition: Carthage dispatched Hanno at the head of a fleet of 60 ships to explore and colonise the northwestern coast of Africa. He sailed through the straits of Gibraltar, founded or repopulated seven colonies along the African coast of what is now Morocco, and explored significantly farther along the Atlantic coast of the continent. Hanno encountered various indigenous peoples on his journey and met with a variety of welcomes.

Gorillai: At the terminus of Hanno's voyage, the explorer found an island heavily populated with what were described as hirsute (hairy) and savage people. Attempts to capture the men failed, but three of the women were taken. These were so ferocious that they were killed, and their skins preserved for transport home to Carthage. The skins were kept in the Temple of Juno (Tanit or Astarte) on Hanno's return and, according to Pliny the Elder, survived until the Roman destruction of Carthage in 146 BC, some 350 years after Hanno's expedition. The interpreters travelling with Hanno called the people Gorillai (in the Greek text $\Gamma \circ \rho i \lambda \lambda \alpha i$). When the American physician and missionary Thomas Staughton Savage and naturalist Jeffries Wyman first described gorillas in the 19th century, the apes were named Troglodytes gorilla after the description in Hanno: "In its inmost recess was an island similar to that formerly described. which contained in like manner a lake with another island inhabited by a rude description of people. The females were much more numerous than the males, and had rough skins: our interpreters called them Gorillae. We pursued but could take none of the males; they all escaped to the top of precipices, which they mounted with ease, and threw down stones; we took three of the

females, but they made such violent struggles, biting and tearing their captors, that we killed them, and stripped off the skins, which we carried to Carthage: being out of provisions we could go no further." — (The Periplus of Hanno)

The primary source for Hanno's expedition is a Greek periplous, supposedly a translation of a tablet Hanno is reported to have hung up on his return to Carthage in the temple of Ba'al Hammon, whom Greek writers identified with Kronos. The full title translated from Greek is The Voyage of Hanno, commander of the Carthaginians, round the parts of Libya beyond the Pillars of Heracles, which he deposited in the Temple of Kronos.

In the fifth century, the text was translated into a rather mediocre Greek. It was not a complete rendering; several abridgments were made. The abridged translation was copied several times by Greek and Greek-speaking Roman clerks. Currently, there are only two copies, dating back to the ninth and the fourteenth centuries.

The first of these manuscripts is known as the Palatinus Graecus 398 and can be studied in the University Library of Heidelberg. The other text is in the Codex Vatopedinus 655, found in the Vatopedi monastery in Mount Athos, Greece, and dated to the beginning of the 14th century; the codex is divided between the British Library and the French Bibliothèque Nationale. Ancient authors' accounts:

Source: "The Voyage of Hanno, commander of the Carthaginians, round the parts of Libya beyond the Pillars of Herakles / Hercules [Gibraltar], which he deposited in the temple of Saturn" in A.H. L. Heeren, Historical researches into the Politics, Intercourse and Trade of the Cathaginians, Ethiopians, and Egyptians, anonymus translator [Oxford: D. A. Talboys, 1832, pp. 492-501.]. The text was known to Herodotus, Pliny the Elder, and Flavius Arrianus of Nicomedia.

Herodotus' account: The Greek historian Herodotus (c. 480 - 425 BC) gives a story based probably upon Hanno's original report: "The Carthaginians tell us that they trade with a race of men who live in a part of Libya beyond the Pillars of Herakles. On reaching this country, they unload their goods, arrange them tidily along the beach, and then, returning to their boats, raise a smoke. Seeing the smoke, the natives come down to the beach, place on the ground a certain quantity of gold in exchange for the goods, and go off again to a distance. The Carthaginians then come ashore and take a look at the gold; and if they think it presents a fair price for their wares, they collect it and go away; if, on the other hand, it seems too little, they go back aboard and wait, and the natives come and add to the gold until they are satisfied. There is perfect honesty on both sides; the Carthaginians never touch the gold until it equals in value what they have offered for sale, and the natives never touch the goods until the gold has been taken away." -Herodotus of Halicarnassus.

Pliny the Elder's account: According to Pliny the Elder, Hanno started his journey at the same time that Himileo started to explore the European Atlantic coast. Pliny reports that Hanno actually managed to circumnavigate the African continent, from Gades to Arabia.

Flavius Arrianus ' Account: Arrian mentions Hanno's voyage at the end of his Anabasis of Alexander VIII (Indica): "Moreover, Hanno the Libyan started out from Carthage and passed the Pillars of Heracles and sailed into the outer Ocean, with Libya on his port side, and he sailed on towards the east, five-and-thirty days all told. But when at last he turned southward, he fell in with every sort of difficulty, want of water, blazing heat, and fiery streams running into the sea." — (Flavius Arrianus of Nicomedia.)

Modern Analysis of the Route: A number of modern scholars have commented upon Hanno's voyage. In many cases, the analysis has been to refine information and interpretation of the original account. William Smith points out that the complement of personnel totalled 30,000, and that the core mission included the intent to found Carthaginian (or in the older parlance 'Libyophoenician') towns. Some scholars have questioned whether this many people accompanied Hanno on his expedition, and suggest 5,000 is a more accurate number. Robin Law notes that "It is a measure of the obscurity of the problem that while some commentators have argued that Hanno reached the Gabon area, others have taken him no further than southern Morocco."

Harden reports a general consensus that the expedition reached at least as far as Senegal. Some agree he could have reached Gambia. However, Harden mentions disagreement as to the farthest limit of Hanno's explorations: Sierra Leone, Cameroon, or Gabon. He notes the description of Mount Cameroon, a 4,040-metre (13,250 ft) volcano, more closely matches Hanno's description than Guinea's 890-metre (2,920 ft) Mount Kakulima. Warmington prefers Mount Kakulima, considering Mount Cameroon too distant.

Warmington suggests that difficulties in reconciling the account's specific details with present geographical understanding are consistent with classical reports of Carthaginian determination to maintain sole control of trade into the Atlantic: "This report was the object of criticism by some ancient writers, including the Pliny the Elder, and in modern times a whole literature of scholarship has grown up around it. The account is incoherent and at times certainly incorrect, and attempts to identify the various places mentioned on the basis of the sailing directions and distances almost all fail. Some scholars resort to textual emendations, justified in some cases; but it is probable that what we have before us is a report deliberately edited so that the places could not be identified by the competitors of Carthage. From everything we know about Carthaginian practice, the resolute determination to keep all knowledge of and access to the western markets from the Greeks, it is incredible that they would have allowed the publication of an accurate description of the voyage for all to read. What we have is an official version of the real report made by Hanno which conceals or falsifies vital information while at the same time gratifying the pride of the Carthaginians in their achievements. The very purpose of the voyage, the consolidation of the route to the gold market, is not even mentioned."

The historian Raymond Mauny, in his 1955 article "La navigation sur les côtes du Sahara pendant l'antiquité", argued that the ancient navigators (Hannon, Euthymène, Scylax, etc.) could not have sailed south in the Atlantic farther than Cape Bojador. He pointed out that antique geographers knew of the Canary Islands but nothing further south. Ships with square sails, without stern rudder, might navigate south, but the winds and currents throughout the vear would prevent the return trip from Senegal to Morocco. Oared ships might be able to achieve the return northward. but only with very great difficulties. Mauny assumed that Hanno did not get farther than the Drâa. He attributed artifacts found on Mogador Island to the expedition described in the Periplous of Pseudo-Scylax and notes that no evidence of Mediterranean trade further south had yet been found. The author ends by suggesting archaeological investigation of the islands along the coast, such as Cape Verde, or the île de Herné [Dragon Island near Dakhla, Western Sahara) where ancient adventurers may have been stranded and settled.]

The Locations and Stops along the way were proposed by Heeres but the publisher of this text version wrote: "In my opinion. I disagree with Heeres on these descriptions. Calculating the times and landmarks observed myself. it does not add up that Hanno only reached as far as the Gambia River." He refered then to his map and satellite images. According to that, Hanno could have reached the region of modern Gabon. In the 1980s, Boris Rankov from Royal Holloway University of London and Professor John Morrison have demontrated on a 1:1 size replica of a trieme that the main driving power of ships in Antiquity were not only applied by the one or two sparse square sails but by athletic men and as many oars as available. The mentioned 50 oars per ship could develop a driving push two or three times higher than all the sails. This is the reason why they were mentioned in Hanno's Periplous.

These are two Different Translations of the Account of the Trip of Hanno around Africa. There is also a map of my compilation that tracks down the different possible locations of this trip, based solely on visual recon, instead of following the suggested locations through old research.)

The Voyage Of Hanno Commander Of The Carthaginians

(Translation No. 1: from: Oxford: D. A. Talboys, 1832, pp. 492-501. Heeren, A. H. L., Historical researches into the Politics.)

It was decreed by the Carthaginians, that Hanno should undertake a voyage beyond the Pillars of Hercules, and found Liby-Phoenician cities. He sailed accordingly with sixty ships of fifty oars each, and a body of men and women to the number of thirty thousand, and provisions and other necessaries

When we had passed the Pillars [The straits of Gibraltar.] on our voyage, and had sailed beyond them for two days, we founded the first city which we named Thymiaterium [according to Heeres, between El Haratch and Marmora in Morocco.]. Below it lay an extensive plain. Proceeding thence towards the west, we came to Soloeis [according to Heeres, Cape Blanco, near Azimur in Morocco.], a promontory of Libya, a place thickly covered with trees, where we erected a temple to Neptune; and again proceeded for the space of half a day towards the east, until we arrived at a lake lying not far from the sea. and filled with abundance of large reeds. Here elephants, and a great number of other wild beasts, were feeding.

Having passed the lake about a day's sail, we founded cities near the sea, called Cariconticos, and Gytte, and Acra, and Melitta, and Arambys [according to Heeres, in the districts of Safy [or Asafy.]. Thence we came to the great river Lixus [according to Heeres, perhaps this is the river Tersif or Maroc.], which flows from Libya. On its banks the Lixitae, a shepherd tribe, were feeding flocks, amongst whom we continued some time on friendly terms. Beyond the Lixitae dwelt the inhospitable Ethiopians, who pasture a wild country intersected by large mountains, from which they say the river Lixus flows. In the neighbourhood of the mountains lived the Troglodytae, men of various appearances, whom the Lixitae described as swifter in running than horses.

Having procured interpreters from them, we coasted along a desert country towards the south two days. Thence we proceeded towards the east the course of a day. Here we found in a recess of a certain bay a small island, containing a circle of five stadia, where we settled a colony, and called it Cerne [according to Heeres, either near Mogador or Santa Cruz.]. We judged from our voyage that this place lay in a direct line with Carthage; for the length of our voyage from Carthage to the Pillars, was equal to that from the Pillars to Cerne.

We then came to a lake, which we reacted by sailing up a large river called Chretes [according to Heeres, the Senegal River.] This lake had three islands, larger than Cerne from which proceeding a day's sail, we came to the extremity of the lake, that was overhung by large mountains, inhabited by savage men clothed in skins of wild beasts, who drove us away by throwing stones, and hindered us from landing. Sailing thence we came to another river, that was large and broad, and full of crocodiles, and river horses [Hippopotamae.]; whence returning back we came again to Cerne

Thence we sailed towards the south twelve days, coasting the shore, the whole of which is inhabited by Ethiopians, who would not wait our approach, but fled from us. Their language was not intelligible even to the Lixitae who were with us. Towards the last day we approached some large mountains covered with trees, the wood of which was sweetscented and variegated. Having sailed by these mountains for two days, we came to an immense opening of the sea; on each side of which, towards the continent, was a plain; from which we saw by night fire arising at intervals in all directions, either more or less.

Having taken in water there, we sailed forwards five days near the land, until we came to a large bay, which our interpreters informed us was called the Western Horn [according to Heeres, the mouth of the Senegal River.]. In this was a large island, and in the island a saltwater lake, and in this another island, where, when we had landed, we could discover nothing in the daytime except trees; but in the night we saw many fires burning, and heard the sound of pipes, cymbals, drums, and confused shouts. We were then afraid, and our diviners ordered us to abandon the island.

Sailing quickly away thence we passed a country burning with fires and perfumes; and streams of fire supplied from it fell into the sea. The country was impassable on account of the heat. We sailed quickly thence, being much terrified; and passing on for four days, we discovered at night a country full of fire. In the middle was a lofty fire, larger than the rest, which seemed to touch the stars. When day came we discovered it to be a large hill, called the Chariot of the Gods. On the third day after our departure thence, having sailed by those streams of fire, we arrived at a bay called the Southern Horn [according to Heeres, the mouth of the Gambia River.]; at the bottom of which lay an island like the former, having a lake, and in this lake another island, full of savage people, the greater part of whom were women, whose bodies were hairy, and whom our interpreters called Gorillae. Though we pursued the men we could not seize any of them; but all fled from us, escaping over the precipices, and defending themselves with stones. Three women were however taken: but they attacked their conductors with their teeth and hands. and could not be prevailed upon to accompany us. Having killed them, we flayed them, and brought their skins with us to Carthage. We did not sail farther on, our provisions failing

The Voyage Of Hanno Commander Of The Carthaginians

(Translation No. 2, from 'The Phoenicians' by Donald Harden, published in 1962 by Thames and Hudson:)

This is the story of the long voyage of Hanno king of the Carhaginians into Libyan (African) lands beyond the Pillars of Heracles (Straits of Gibraltar), which he dedicated on a tablet in the temple of Kronos:

1. The Carthaginians decided that Hanno should sail beyond the Pillars of Heracles and found cities of Libyphoenicians. He set sail with 60 penteconters and about 30,000 men and women, and provisions and other necessaries.

2.After sailing beyond the Pillars for two days we founded the first city which we called Thymiaterion. Below it was a large plain.

3. Sailing thence westward we came to Soloeis, a Libyan promontory covered with trees. There we founded a temple to Poseidon.

4. Journeying eastward for half a day we reached a lake not far from the sea, covered with a great growth of tall reeds, where elephants and many other wild animals fed.

5. A day's sea journey beyond this lake we founded cities on the coast called Karikon Teichos, Bytte, Akra, Melitta and Arambys.

6. Passing on from there we came to the large river Lixos, flowing from Libya, beside which nomads called Lixitae

pastured their flocks. We stayed some time with them and became friends.

7. Inland from there dwelt inhospitable Ethiopians in a land ridden with wild beasts and hemmed in by great mountains. They say that the Lixos flows down from there and that amongst these mountains Troglodytes of strange appearance dwell, who according to the Lixitae can run more swiftly than horses.

8. Taking interpreters from the Lixitae we sailed south along the desert shore for two days and then for one day eastward and found a small island 5 stades (about 1 km) in circumference at the further end of a gulf. We made a settlement there and called it Cerne. We judged from our journey that it was directly opposite Carthage, for the voyage from Carthage to the Pillars and from there to Cerne seemed alike.

9. From here sailing up a big river called Chretes we reached a lake, in which were three islands bigger than Cerne. Completing a day's sail from here we came to the end of the lake, overhung by some very high mountains crowded with savages clad in skins of wild beasts, who stoned us and beat us off and prevented us from disembarking.

10.Sailing from there we came to another big wide river, teeming with crocodiles and hippopotamuses. We turned again from there and came back to Cerne.

11. We sailed south for twelve days from there, clinging to the coast, which was all along occupied by Ethiopians who did not stay their ground, but fled from us. Their speech was unintelligible, even to our Lixitae.

12. On the last day we came to anchor by some high mountains clad with trees whose wood was sweet smelling and mottled.

13. Sailing round these for two days we reached an immense gulf, on either shore of which was a plain where by night we saw big and little fires flaming up at intervals everywhere.

14. Taking on water here, we sailed on for five days along the coast until we came to a great bay which our interpreters called the Horn of the West. In it was a large island and in the island a salt-water lake, within which was another island where we disembarked. By day we could see nothing but a forest, but by night we saw many fires burning and we heard the sound of flutes and of beating of cymbals and drums and a great din of voices. Fear came upon us and the soothsayers bade us leave the island.

15. We sailed thence in haste and skirted a fiery coast replete with burning incense. Great streams of fire and lava poured down into the sea and the land was unapproachable because of the heat.

16. We left there hurriedly in fear and sailing for four days we saw the land by night full of flames. In the middle was a high flame taller than the rest, reaching, as it seemed, the stars. By day it was seen to be a very high mountain called the Chariot of the Gods.

17. Thence sailing for three days past fiery lava flows we reached a gulf called the Horn of the South.

18. At the farther end of this bay was an island, like the first, with a lake, within which was another island full of savages. By far the greater number were women with shaggy bodies, whom our interpreters called Gorillas. Chasing them we were unable to catch any of the men, all of whom, being used to climbing precipices, got away, defending themselves by throwing stones. But we caught three women, who bit and mangled those who carried them off, being unwilling to follow them. We killed them, however, and flayed them and brought their skins back to Carthage. For we did not sail further as our supplies gave out.'

THE INDIKA BY MEGASTHENES

From: Ancient India as Described by Megasthenes Calcutta and Bombay: Thacker, Spink, 1877, 30-174. Translation: John Watson McCrindle, 1887 Estimated Range of Dating: 330 - 250 B.C.

(Indika is an account of Mauryan India by the Greek writer Megasthenes. The original book is now lost, but its fragments have survived in later Greek and Latin works. The earliest of these works are those by Diodorus Siculus, Strabo (Geographica), Pliny, Titus Flavius Josephus and Lucius Flavius Arrianus (in short Arrian).

The Indika by the Greek writer Megasthenes is written with the Greek letter "k" In order to make a difference to Arrianus' work Indica which is written with the Roman letter "c". Arrianus' work is part of his book the Alexandrou Anabasis of Anabasis of Alexander [The Military Campaign of Alexander the Great.]. Arrian of Nicomedia (Greek: Arrianos; name of Roman citizenship: Lucius Flavius Arrianus; c. 89–160 AD) was a Greek-Roman historian, public servant, military commander and philosopher.

John Watson McCrindle published a reconstructed version of Indica in 1887. However, this reconstruction is not universally accepted because McCrindle attributed several fragments in the writings of the 1st century BC writer Diodorus to Megasthenes although he was not explicitly mentioned. However, McCrindle's collection gives us an idea who Romans saw India. After this Indika, we also will show the Indica of Arrianus. These two documents are important as they show that the Roman and Indian civilisations were by no means isolated but interacted with one another. Over a long period in Antiquity, they did only exchanged goods and people, but also ideas and ethics, a fact that is particularly shown by Buddhist disciples who travelled not only east to Indochina and to China but also to Greece, the philosophial centre of the Roman civilisation.)

Project South Asia editor's note: We have removed the footnotes that appeared in J. W. McCrindle's original text for clarity. Serious students and scholars who wish to see the footnotes are encouraged to refer to the original text.)

MEGASTHENES FRAGMENT 1.a

AN EPITOME OF MEGASTHENES. (Diod. 2. 35-42.)

India, which is in shape quadrilateral*, has its eastern as well as its western side bounded by the great sea [Indian Ocean], but on the northern side it is divided by Mount Hemodos from that part of Skythia which is inhabited by those Skythians who are called the Sakai, while the fourth or western side is bounded by the river called the Indus, which is perhaps the largest of all rivers in the world after the Nile. [* here it is obvious that Megathenes had no correct map at hand. He would have seen by then that India's shape is triangular. The other descriptions however are quite correct.] The extent of the whole country from east to west is said to be 28,000 stadia, and from north to south 32,000. [1 stadion is about 1/10 of a mile; so 28,000 stadia are 2,800 mi [4,500 km], and 32,000 stadia are 3,200 mi [5,000 km]. That is a correct approximation if we take the entire area of Indian culture into consideration.] Being thus of such vast extent, it seems wellnigh to embrace the whole of the northern tropic zone of the earth, and in fact at the extreme point of India the gnomon of the sundial may frequently be observed to cast no shadow. while the constellation of the Bear is by night invisible, and in the remotest parts even Arcturus disappears from view. Consistently with this, it is also stated that shadows there fall to the southward.

India has many huge mountains which abound in fruit-trees of every kind, and many vast plains of great fertility-more or less beautiful, but all alike intersected by a multitude of rivers.

The greater part of the soil, moreover, is under irrigation, and consequently bears two crops in the course of the year. It teems at the same time with animals of all sorts,--beasts of the field and fowls of the air,--of all different degrees of strength and size. It is prolific, besides, in elephants, which are of monstrous bulk, as its soil supplies food in unsparing profusion, making these animals far to exceed in strength those that are bred in Libya. It results also that, since they are caught in great numbers by the Indians and trained for war, they are of great moment in turning the scale of victory.

The inhabitants, in like manner, having abundant means of subsistence, exceed in consequence the ordinary stature, and are distinguished by their proud bearing. They are also found to be well skilled in the arts, as might be expected of men who inhale a pure air and drink the very finest water. And while the soil bears on its surface all kinds of fruits which are known to cultivation, it has also under ground numerous veins of all sorts of metals, for it contains much gold and silver, and copper and iron in no small quantity, and even tin and other metals, which are employed in making articles of use and ornament, as well as the implements and accoutrements of war.

In addition to cereals, there grows throughout India much millet, which is kept well watered by the profusion of riverstreams, and much pulse of different sorts, and rice also, and what is called bosporum, as well as many other plants useful for food, of which most grow spontaneously. The soil yields, moreover, not a few other edible products fit for the subsistence of animals, about which it would be tedious to write. It is accordingly affirmed that famine has never visited India, and that there has never been a general scarcity in the supply of nourishing food. For, since there is a double rainfall in the course of each year, -- one in the winter season, when the sowing of wheat takes place as in other countries, and the second at the time of the summer solstice, which is the proper season for sowing rice and bosporum, as well as sesamum and millet -- the inhabitants of India almost always gather in two harvests annually; and even should one of the sowings prove more or less abortive they are always sure of the other crop. The fruits, moreover, of spontaneous growth, and the esculent roots which grow in marshy places and are of varied sweetness, afford abundant sustenance for man. The fact is, almost all the plains in the country have a moisture which is alike genial, whether it is derived from the rivers, or from the rains of the summer season, which are wont to fall every year at a stated period with surprising regularity; while the great heat which prevails ripens the roots which grow in the marshes, and especially those of the tall reeds.

But, farther, there are usages observed by the Indians which contribute to prevent the occurrence of famine among them; for whereas among other nations it is usual, in the contests of war, to ravage the soil, and thus to reduce it to an uncultivated waste, among the Indians, on the contrary, by whom husbandmen are regarded as a class that is sacred and inviolable, the tillers of the soil, even when battle is raging in their neighbourhood, are undisturbed by any sense of danger, for the combatants on either side in waging the conflict make carnage of each other, but allow those engaged in husbandry to remain quite unmolested. Besides, they neither ravage an enemy's land with fire, nor cut down its trees.

India, again, possesses many rivers both large and navigable, which, having their sources in the mountains which stretch along the northern frontier, traverse the level country, and not a few of these, after uniting with each other, fall into the river called the Ganges. Now this river, which at its source is 30 stadia broad, flows from north to south, and empties its waters into the ocean forming the eastern boundary of the Gangaridai, a nation which possesses a vast force of the largest-sized elephants. Owing to this, their country has never been conquered by any foreign king: for all other nations dread the overwhelming number and strength of these animals. [Thus Alexander the Macedonian, after conquering all Asia, did not make war upon the Gangaridai, as be did on all others: for when he had arrived with all his troops at the river Ganges. and had subdued all the other Indians, he abandoned as hopeless an invasion of the Gangaridai when he learned that they possessed four thousand elephants well trained and equipped for war.] Another river, about the same size as the Ganges, called the Indus, has its sources, like its rival, in the north, and falling into the ocean forms on its way the boundary of India: in its passage through the vast stretch of level country it receives not a few tributary streams which are navigable, the most notable of them being the Hupanis, the Hudaspes, and the Akesines. Besides these rivers there are a great many others of every description, which permeate the country, and supply water for the nurture of garden vegetables and crops of all sorts. Now to account for the rivers being so numerous, and the supply of water so superabundant, the native philosophers and proficients in natural science advance the following reasons: -- They say that the countries, which surround India--those of the Skythians and Baktrians and also of the Aryans--are more elevated than India, so that their waters, agreeably to natural law, flow down together from all sides to the plains beneath, where they gradually saturate the soil with moisture, and generate a multitude of rivers.

A peculiarity is found to exist in one of the rivers of India,-that called the Sillas, which flows from a fountain bearing the same name. It differs from all other rivers in this respect,--that nothing cast into it will float, but everything, strange to say, sinks down to the bottom.

It is said that India, being of enormous size when taken as a whole, is peopled by races both numerous and diverse, of which not even one was originally of foreign descent, but all were evidently indigenous; and moreover that India neither received a colony from abroad, nor sent out a colony to any other nation. The legends further inform us that in primitive times the inhabitants subsisted on such fruits as the earth yielded spontaneously, and were clothed with the skins of the beasts found in the country, as was the case with the Greeks; and that, in like manner as with them, the arts and other appliances which improve human life were gradually invented, Necessity herself teaching them to an animal at once docile and furnished not only with hands ready to second all his efforts, but also with reason and a keen intelligence.

The men of greatest learning among the Indians tell certain legends, of which it may be proper to give a brief summary. They relate that in the most primitive times, when the people of the country were still living in villages, Dionusos made his appearance coming from the regions lying to the west and at the head of a considerable army. He overran the whole of India, as there was no great city capable of resisting his arms. The heat, however, having become excessive, and the soldiers of Dionusos being afflicted with a pestilence, the leader, who was remarkable for his sagacity, carried his troops away from the plains up to the hills. There the army, recruited by the cool breezes and the waters that flowed fresh from the fountains, recovered from sickness. The place among the mountains where Dionusos restored his troops to health was called Meros; from which circumstance, no doubt, the Greeks have transmitted to posterity the legend concerning the god, that Dionusos was bred in his father's thigh. Having after this turned his attention to the artificial propagation of useful plants, he communicated the secret to the Indians, and taught them the way to make wine, as well as other arts conducive to human well-being. He was, besides, the founder of large cities, which he formed by removing the villages to convenient sites, while he also showed the people how to worship the deity, and introduced laws and courts of justice. Having thus achieved altogether many great and noble works, he was regarded as a deity and. gained immortal honours. It is related also of him that he led about with his army a great host of women and employed, in marshalling his troops for battle, drums and cymbals, as the trumpet had not in his days been invented; and that after reigning over the whole of India for two and fifty years he died of old age, while his sons, succeeding to the

government, transmitted the sceptre in unbroken succession to their posterity. At last, after many generations had come and. gone, the sovereignty, it is said, was dissolved, and democratic governments were set up in the cities.

Such, then, are the traditions regarding Dionusos and his descendants current among the Indians who inhabit the hillcountry. They further assert that Herakles also was born among them. They assign to him, like the Greeks, the club and the lion's skin. He far surpassed other men in personal strength and prowess, and cleared sea and land of evil beasts. Marrying many wives he begot many sons, but one daughter only. The sons having reached man's estate, he divided all India into equal portions for his children, whom he made kings in different parts of his dominions. He provided similarly for his only daughter, whom be reared up and made a queen. He was the founder, also, of no small number of cities, the most renowned and greatest of which he called Palibothra. He built therein many sumptuous palaces, and settled within its walls a numerous population. The city he fortified with trenches of notable dimensions, which were filled with water introduced from the river. Herakles, accordingly, after his removal from among men, obtained immortal honour: and his descendants, having reigned for many generations and signalized themselves by great achievements, neither made any expedition beyond the confines of India, nor sent out any colony abroad. At last, however, after many years had gone, most of the cities adopted the democratic form of government. though some retained the kingly until the invasion of the country by Alexander. Of several remarkable customs existing among the Indians, there is one prescribed by their ancient philosophers which one may regard as truly admirable: for the law ordains that no one among them shall, under any circumstances, be a slave, but that, enjoying freedom, they shall respect the equal right to it which all possess: for those they thought, who have learned neither to domineer over nor to cringe to others will attain the life best adapted for all vicissitudes of lot: for it is but fair and reasonable to institute laws which bind all equally, but allow property to be unevenly distributed.

The whole population of India is divided into seven castes, of which the first is formed by the collective body of the Philosophers, which in point of number is inferior to the other classes, but in point of dignity preeminent over all. For the philosophers, being exempted from all public duties, are neither the masters nor the servants of others. They are, however, engaged by private persons to offer the sacrifices due in lifetime, and to celebrate the obsequies of the dead: for they are believed to be most dear to the gods, and to be the most conversant with matters pertaining to Hades. In requital of such services they receive valuable gifts and privileges. To the people of India at large they also render great benefits, when, gathered together at the beginning of the year, they forewarn the assembled multitudes about droughts and. wet weather, and also about propitious winds, and diseases, and other topics capable of profiting-the hearers. Thus the people and the sovereign, learning beforehand what is to happen, always make adequate provision against a coming deficiency, and never fail to prepare beforehand what will help in a time of need. The philosopher who errs in his predictions incurs no other penalty than obloquy, and he then observes silence for the rest of his life

The second caste consists of the Husbandmen, who appear to be far more numerous than the others. Being, moreover, exempted from fighting and other public services, they devote the whole of their time to tillage; nor would an enemy coming upon a husbandman at work on his land do him any harm, for men of this class, being regarded as public benefactors, are protected from all injury. The land, thus remaining unravaged, and producing heavy crops, supplies the inhabitants with all that is requisite to make life very enjoyable. The husbandmen themselves, with their wives and children, live in the country, and entirely avoid going into town. They pay a land-tribute to the king, because all India is the property of the crown, and no private person is permitted to own land. Besides the land-tribute, they pay into the royal treasury a fourth part of the produce of the soil.

The third caste consists of the Neatherds and Shepherds and in general of all herdsmen who neither settle in towns nor in villages, but live in tents. By hunting and trapping they clear the country of noxious birds and wild beasts. As they apply themselves eagerly and assiduously to this pursuit, they free India from the pests with which it abounds,--all sorts of wild beasts, and birds which devour the seeds sown by the husbandmen.

The fourth caste consists of the Artizans. Of these some are armourers, while others make the implements which husbandmen and others find useful in their different callings. This class is not only exempted from paying taxes, but even receives maintenance from the royal excheduer.

The fifth caste is the Military. It is well organized and equipped for war, holds the second place in point of numbers, and gives itself up to idleness and amusement in the times of peace. The entire force--men-at-arms, war-horses, warelephants, and all--are maintained at the king's expense. The sixth caste consists of the Overseers. It is their province to inquire into and superintend all that goes on in India, and make report to the king, or, where there is not a king, to the magistrates.

The seventh caste consists of the Councillors and Assessors,of those who deliberate on public affairs. It is the smallest class, looking to number, but the most respected, on account of the high character and wisdom of its members; for from their ranks the advisers of the king are taken, and the treasurers, of the state, and the arbiters who settle disputes. The generals of the army also, and the chief magistrates, usually belong to this class.

Such, then, are about the parts into which the body politic in India is divided. No one is allowed to marry out of his own caste, or to exercise any calling or art except his own: for instance, a soldier cannot become a husbandman, or an artizan a philosopher.

India possesses a vast number of huge elephants, which far surpass those found elsewhere both in strength and size. This animal does not cover the female in a peculiar way, as some affirm, but like horses and other quadrupeds. The period of gestation is at shortest sixteen months, and at furthest eighteen. Like mares, they generally bring forth but one young one at a time, and this the dam suckles for six years. Most elephants live to be as old as an extremely old man, but the most aged live two hundred years.

Among the Indians officers are appointed even for foreigners whose duty is to see that no foreigner is wronged. Should any of them lose his health, they send physicians to attend him, and take care of him otherwise, and if he dies they bury him, and deliver over such property as he leaves to his relatives. The judges also decide cases in which foreigners are concerned, with the greatest care, and come down sharply on those who take unfair advantage of them. [What we have now said regarding India and its antiquities will suffice, for our present purpose.]

MEGASTHENES FRAGMENT 1.b

Concerning Dionusos. (Diod. 3. 63.)

Now some, as I have already said, supposing that there were three individuals of this name, who lived in different ages. assign to each appropriate achievements. They say, then, that the most ancient of them was Indos, and that as the country, with its genial temperature, produced spontaneously the vinetree in great abundance, he was the first who crushed grapes and discovered the use of the properties of wine. In like manner he ascertained what culture was requisite for figs and other fruit trees, and transmitted this knowledge to aftertimes: and, in a word, it was he who found out how these fruits should be gathered in, whence also he was called Lenaios. This same Dionusos, however, they call also Katapogon, since it is a custom among the Indians to nourish their beards with great care to the very end of their life. Dionusos then, at the head of an army, marched to every part of the world, and taught mankind the planting of the vine, and how to crush grapes in the winepress, whence he was called Lenaios. Having in like manner imparted to all a knowledge of his other inventions, he obtained after his departure from among men immortal honour from those who had benefited by his labours. It is further said that the place is pointed out in India even to this day where the god had been, and that cities are called by his name in the vernacular dialects. and that many other important evidences still exist of his having been born in India, about which it would be tedious to

INDIKA BOOK 1.

MEGASTHENES FRAGMENT 2

Of the Boundaries of India, its General Character, and its Rivers. (Lucius Flavius Arrianus, The Indica, from The Expedition of Alexander, 5. 6. 2-11.)

According to Eratosthenes, and Megasthenes who lived with Siburtios the satrap of Arachosia, and who, as he himself tells us, often visited Sandrakottos the king of the Indians, India forms the largest of the four parts into which Southern Asia is divided, while the smallest part is that region which is included between the Euphrates and our own sea. The two remaining parts, which are separated from the others by the Euphrates and. the Indus, and lie between these rivers, are scarcely of sufficient size to be compared with India, even should they be taken both together. The same writers say that India is bounded on its eastern side, right onwards to the south, by the great ocean; that its northern frontier is formed by the Kaukasos range as far as the junction of that range with Tauros; and that the boundary towards the west and the north-west, as far as the great ocean, is formed by the river Indus. A considerable portion of India consists of a level plain, and this, as they conjecture, has been formed from the alluvial deposits of the river, -- inferring this from the fact that in other countries plains which are far away from the sea are generally formations of their respective rivers, so that in old times a country was even called by the name of its river. As an instance, there is the so-called plain of the Hermos--a river in Asia (Minor), which, flowing from the Mount of Mother

Dindymene, falls into the sea near the Aeolian city of Smyrna. There is also the Lydian plain of Kaustros, named after that Lydian river; and another, that of the Kaikos, in Mysia; and one also in Karia, -- that of the Maiandros, which extends even to Miletos, which is an Ionian city. [As for Egypt, both the historians Herodotus and Hekataios (or at any rate the author of the work on Egypt if he was other than Hekataios) alike agree in declaring it to be the gift of the Nile, so that that country was perhaps even called after the river; for in early times Aigyptos was the name of the river which now-adays both the Egyptians and other nations call the Nile, as the words of Homer clearly prove, when he says that Menelaos stationed his ships at the mouth of the river Aigyptos. If, then, there is but a single river in each plain, and these rivers, though by no means large, are capable of forming, as they flow to the sea, much new land, by carrying down silt from the uplands, where their sources are, it would be unreasonable to reject the belief in the case of India that a great part of it is a level plain, and that this plain is formed from the silt deposited by the rivers, seeing that the Hermos, and the Kaüstros, and the Kaïkos, and the Maiandros, and all the many rivers of Asia which fall into the Mediterranean, even if united, would not be fit to be compared in volume of water with an ordinary Indian river, and much less with the greatest of them all, the Ganges, with which neither the Egyptian Nile, nor the Danube which flows through Europe, can for a moment be compared. Nay, the whole of these if combined all into one are not equal even to the Indus, which is already a large river where it rises from its fountains, and which after receiving as tributaries fifteen rivers all greater than those of Asia, and bearing off from its rival the honour of giving name to the country, falls at last into the sea.]

MEGASTHENES FRAGMENT 3

Of the Boundaries of India (Lucius Flavius Arrianus, The Indica, 2. 1. 7.) (See translation of Arrian.)

MEGASTHENES FRAGMENT 4

Of the Boundaries and Extent of India. (Strabo, 15. 1. 11, p.689.)

India is bounded on the north by the extremities of Tauros. and from Ariana to the Eastern Sea by the mountains which are variously called by the natives of these regions Parapamisos, and Hemodos, and Himaos, and other names, but by the Macedonians Kaukasos. The boundary on the west is the river Indus, but the southern and eastern sides, which are both much greater than the others, run out into the Atlantic Ocean. The shape of the country is thus rhomboïdal, since each of the greater sides exceeds its opposite side by 3000 Stadia, which is the length, of the promontory common to the south and the east coast, which projects equally in these two directions. [The length of the western side, measured from the Kaukasian mountains to the southern sea along the course of the river Indus to its mouths, is said-to be 13,000 stadia, so that the eastern side opposite, with the addition of the 3000 stadia of the promontory, will be somewhere about 16.000 stadia. This is the breadth of India where it is both smallest and greatest.] The length from west to east, as far as Palibothra can be stated with greater certainty, for the royal road which leads to that city bas been measured by schoeni, and is in length 10,000 stadia. The extent of the parts beyond can only be conjectured from the time taken to make voyages from the sea to Palibothra by the Ganges, and may be about 6000 stadia. The entire length, computed at the shortest, will be 16,000 stadia. This is the estimate of Eratosthenes, who says he derived it principally from the authoritative register of the stages on the Royal Road. Herein Megasthenes agrees with him. [Patrokles, however, makes the length less by 1000 stadia.1

MEGASTHENES FRAGMENT 5

Of the Size of India. (Strabo, 2. 1. 7, p.69.)

Again, Hipparchos, in the 2nd volume of his commentary, charges Eratosthenes himself with throwing discredit on Patrokles for differing from Megasthenes about the length of India on its northern side, Megasthenes making it 16,000 stadia, and Patrokles 1000 less.

MEGASTHENES FRAGMENT 6

Of the Size of India. (Strabo, 15. 1. 12, pp.689-690.) [From this, one can readily see, how the accounts of the other writers vary from one another. Thus Ktesias says that India is not of less size than the rest of Asia; Onesikritos regards it as the third part of the habitable World; and Nearchos says it takes one four months to traverse the plain only.] Megasthenes and Deimachos incline to be more moderate in their estimate, for according to them the distance from the Southern Sea to Kaukasos is over 20,000 stadia. [Deimachos, however, allows that the distance in some places exceeds 30,000 stadia. Of these notice has been taken in an earlier part of the work.]

MEGASTHENES FRAGMENT 7

Of the Size of India. (Strabo, 2. 1. 4, pp.68-69.)

Hipparchos controverts this view, urging the futility of the proofs on which it rests. Patrokles, he says, is unworthy of trust, opposed as he is by two competent authorities. Deimachos and Megasthenes, who state that in some places the distance from the southern sea is 20,000 stadia, and in others 30,000. Such, he says, is the account they give, and it agrees with the ancient charts of the country.

MEGASTHENES FRAGMENT 8

Of the, Size, of India. (Lucius Flavius Arrianus, The Indica, 3.7-8.)

With Megasthenes the breadth of India is its extent from east to west, though this is called by others its length. His account is that the breadth at shortest is 16,000 stadia, and its length-by which he means its extent from north to south--is at the narrowest 22,300 stadia.

MEGASTHENES FRAGMENT 9

Of the setting of the Bear, and shadows falling in contrary

directions. (Strabo, II. L19,--p. 76.) Again, he [Eratosthenes] wished to show the ignorance of Deimachos, and his want of a practical knowledge of such subjects, evidenced as it was by his thinking that India lay between the autumnal equinox and the winter tropic, and by his contradicting the assertion of Megasthenes that in the southern parts of India the constellation of the Bear disappeared from view, and shadows fell in opposite directions,--phenomena which he assures us are never seen in India, thereby exhibiting the sheerest ignorance. He does not agree in this opinion, but accuses Deimachos of ignorance for directions, as Megasthenes supposed.

MEGASTHENES FRAGMENT 10

Of the Setting of the Bear. (Pliny the Elder, Natural History, 6. 22.6.)

Next [to the Prassi] in the interior are the Monedes and the Suari, to whom belongs Mount Maleus, on which shadows fall towards the north in winter, and in summer to the south, for six months alternately. The Bears, Baeton says, in that part of the country are only once visible in the course of the year, and not for more than fifteen clays. Megasthenes says that this takes place in many parts of India. [Conf. Solin, 52.13:--Beyond Palibrotha is Mount Maleus, on which shadows fall in winter towards the north, and in summer towards the south, for six months alternately. The North Pole is visible in that part of the country once in the course of the year, and not for longer than fifteen days as Baeton informs us who allows that this occurs in many parts of India.]

MEGASTHENES FRAGMENT 11

Of the Fertility of India. (Strabo, 15. 1. 20, p.693.)

Megasthenes indicates the fertility of India by the fact of the soil producing two crops every year both of fruits and grain. Eratosthenes writes to the same effect, for he speaks of a winter and a summer sowing, which both have rain: for a year, he says, is never found to be without rain at both those seasons, whence ensues a great abundance, since the soil is always productive. Much fruit is produced by trees; and the roots of plants, particularly of tall reeds, are sweet both by nature and by coction, since the moisture by which they are nourished is heated by the rays of the sun, whether it has fallen from the clouds or been drawn from the rivers. Eratosthenes uses here a peculiar expression: for what is called by others the ripening of fruits and the juices of plants is called among the Indians coction, which is as effective in producing a good flavour as the coction by fire itself. To the heat of the water the same writer ascribes the wonderful flexibility of the branches of trees, from which wheels are made, as also the fact of there being trees on which wool grows. [Conf. Eratosth. ap. Strabo. XV. i. 13,-p. 690:--From the vapours arising from such vast rivers, and from the Etesian winds, as Eratosthenes states, India is watered by the summer rains, and the plains are overflowed. During these rains, accordingly, -- flax is sown and millet, also sesamum, rice, and bosmorum, and in the winter time wheat, barley, pulse, and other esculent fruits unknown to us.]

MEGASTHENES FRAGMENT 12.a

Of some Wild Beasts of India. (Strabo, 15. 1. 37, p.703.) According to Megasthenes the largest tigers are found among the Prasii, being nearly twice the size of the lion, and so strong that a tame tiger led by four men having seized a mule by the hinder leg overpowered it and dragged it to him. The monkeys are larger than the largest dogs; they are white except in the face, which is black, though the contrary is observed elsewhere. Their tails are more than two cubits in length. They are very tame, and not of a malicious disposition: so that they neither attack man nor steal. Stones are dug up which are of the colour of frankincense, and sweeter than figs or honey. In some parts of the country there are serpents two cubits long which have membranous wings like bats. They fly about by night, when they let fall drops of urine or sweat, which blister the skin of persons not on their guard, with

putrid sores. There are also winged scorpions of an extraordinary size. Ebony grows there. There are also dogs of great strength and courage, which will not let go their hold till water is poured into their nostrils: they bite so eagerly that the eyes of some become distorted, and the eyes of others fall out. Both a lion and a bull were held fast by a dog. The bull was seized by the muzzle, and died before the dog could be taken off.

MEGASTHENES FRAGMENT 12.b

There is found in India (a graminivorous animal which is double the size of a horse, and which has a very bushy tail purely black in colour. The hair of this tail is finer than human hair, and its possession is a point on which Indian women set great store, for therewith they make a charming coiffure, by binding and braiding it with the locks of their own natural hair. The length of a hair is two cubits, and from a single root there sprout out, in the form of a fringe, somewhere about thirty hairs. The animal itself is the most timid that is known, for should it perceive that any one is looking at it, it starts off at its utmost speed, and runs right forward -- but its eagerness to escape is greater than the rapidity of its pace. It is hunted with horses and hounds good to run. When it sees that it is on the point of being caught, it hides its tail in some near thicket, while it stands at bay facing its pursuers, whom it watches narrowly. It even plucks up courage in a way, and thinks that since its tail is hid from view the hunters will not care to capture it, for it knows that its tail is the great object of attraction. But it finds this to be, of course, a vain delusion, for some one hits it with a poisoned dart, who then flays off the entire skin (for this is of value) and throws away the carcase, as the Indians make no use of any part of its flesh.

But further: whales are to be found in the Indian Sea. and these five times larger than the largest elephant. A rib of this monstrous fish measures as much as twenty cubits, and its lip fifteen cubits. The fins near the gills are each of them so much as seven cubits in breadth. The shell-fish called Kerukes are also met with, and the purple fish of a size that would admit it easily into a gallon measure, while on the other hand the shell of the sea-urchin is large enough to cover completely a measure of that size. But fish in India attain enormous dimensions, especially the sea-wolves, the thunnies, and the golden-eyebrows. I bear also that at the season when the rivers are swollen, and with their full and boisterous flood deluge all the land, the fish are carried into the fields, where they swim and wander to and fro, even in shallow water, and that when the rains which flood the rivers cease and the waters retiring from the land resume their natural channels. then in the low-lying tracts and in flat and marshy grounds, where we may be sure the so-called Nine are wont to have some watery recesses, fish even of eight cubits length are found, which the husbandmen themselves catch as they swim about languidly on the surface of the water, which is no longer of a depth they can freely move in, but in fact so very shallow that it is with the utmost difficulty they can live in it at all.

The following fish are also indigenous to India:--prickly roaches, which are never in any respect smaller than the asps of Argolis; and shrimps, which in India are even larger than crabs. These, I must mention, finding their way from the sea up the Ganges, have claws which are very large, and which feel rough to the touch. I have ascertained that those shrimps which pass from the Persian Gulf into the river Indus have their prickles smooth, and the feelers with which they are furnished elongated and curling, but this species has no claws.

The tortoise is found in India, where it lives in the rivers. It is of immense size and it has a shell not smaller than a fullsized skiff, and which is capable of holding ten meimni (120 gallons) of pulse. There are, however, also land-tortoises which may be about as big as the largest clods turned up in a rich soil where the glebe is very yielding, and the plough sinks deep, and, cleaving the furrows with ease, piles the clods up high. These are said to cast their shell. Husbandmen, and all the hands engaged in field labour, turn them up with their mattocks, and take them out just in the way one extracts wood-worms from the plants they have eaten into. They are fat things and their flesh is sweet, having nothing of the sharp flavour of the sea-tortoise.

Intelligent animals are to be met with among ourselves, but they are few, and not at all so common as they are in India. For there we find the elephant, which answers to this character, and the parrot, and apes of the sphinx kind, and the creatures called satyrs. Nor must we forget the Indian ant, which is so noted for its wisdom. The ants of our own country do, no, doubt, dig for themselves subterranean holes and burrows, and by boring provide themselves with lurkingplaces, and wear out all their strength in what may be called mining operations, which are indescribably toilsome and conducted with secrecy: but the Indian ants construct for themselves a cluster of tiny dwelling-houses, seated not on sloping or level grounds where they could easily be inundated, but on steep and lofty eminences. And in these, by boring out with untold skill certain circuitous passages which remind one of the Egyptian burial-vaults or Cretan labyrinths, they so contrive the structure of their houses that none of the lines run straight, and it is difficult for anything to enter them or flow into them, the windings and perforations being so tortuous. On the outside they leave only a single aperture to admit themselves and the grain which they collect and carry to their store-chambers. Their object in selecting lofty sites for their mansions is, of course, to escape the high floods and inundations of the rivers; and they derive this advantage from their foresight, that they live as it were in so many watchtowers or islands when the parts around the heights become all a lake. Moreover, the mounds they live in, though placed in contiguity, so far from being loosened and torn asunder by the deluge, are rather strengthened, especially by the morning dew: for they put on, so to speak, a coat of ice formed from this dew-thin, no doubt, but still of strength; while at the same time they are made more compact at their base by weeds and bark of trees adhering, which the silt of the river has carried down. Let so much about Indian ants be said by me now, as it was said by Iobas long ago.

In the country of the Indian Areianoi there is a subterranean chasm down in which there are mysterious vaults, concealed ways, and thoroughfares invisible to men. These are deep withal, and stretch to a very great distance. How they came to exist, and how they were excavated, the Indians do not say, nor do I concern myself to inquire. Hither the Indians bring more than thrice ten thousand head of cattle of different kinds, sheep and goats, and oxen and horses; and every person who has been terrified by, an ominous dream, or a warning sound or prophetic voice, or who has seen a bird of evil augury, as a substitute for his life casts into the chasm such a victim as his private means can afford, giving the animal as a ransom to save his soul alive. The victims conducted thither are not led in chains nor otherwise coerced. but they go along this road willingly, as if urged forward by some mysterious spell and as soon as they find themselves on the verge of the chasm they voluntarily, leap in, and disappear for ever from human sight so soon as they fall into this mysterious and viewless cavern of the earth. But above there are heard the bellowings of oxen, the bleating of sheep, the neighing of horses, and the plaintive cries of goats, and if any one goes near enough to the edge and closely applies his ear he will hear afar off the sounds just mentioned. This commingled sound is one that never ceases, for every day that passes men bring new victims to be their substitutes. Whether the cries of the animals last brought only are beard, or the cries also of those brought before, I know not, -- all I know is that the cries are heard.

In the sea which has been mentioned they say there is a very large island, of which, as I hear, the name is Taprobane from what I can learn, it appears to be a very long and mountainous island, having a length of 7,000 stadia and a breadth of 5,000. It has not, however, any cities, but only villages, of which the number amounts to 750. The houses in which the inhabitants lodge themselves are made of wood, and sometimes also of reeds

In the sea which surrounds the islands, tortoises are bred of so vast a size that their shells are employed to make roofs for the houses: for a shell, being fifteen cubits in length, can hold a good many people under it, screening them from the scorching heat of the sun, besides affording them a welcome shade. But, more than this, it is a protection against the violence of storms of rain far more effective than tiles, for it at once shakes off the rain that dashes against it, while those under its shelter hear the rain rattling as on the roof of a house. At all events they do not require to shift their abode. like those whose

tiling is shattered, for the shell is hard and like a hollowed rock and the vaulted roof of a natural cavern.

The island, then, in the great sea, which they call Taprobane, has palm-groves, where the trees are planted with wonderful regularity all in a row, in the way we see the keepers of pleasure parks plant out shady trees in the choicest spots. It has also herds of elephants, which are there very numerous and of the largest size. These island elephants are more powerful than those of the mainland, and in appearance larger, and may be pronounced to be in every possible way more intelligent. The islanders export them to the mainland opposite in boats, which they construct expressly for this traffic from wood supplied by the thickets of the island, and they dispose of their cargoes to the king of the Kalingai. On account of the great size of the island, the inhabitants of the interior have never seen the sea, but pass their lives as if resident on a continent, though no doubt they learn from others that they are all around enclosed by the sea. The inhabitants, again, of the coast have no practical acquaintance with elephant-catching, and know of it only by report. All their energy is devoted to catching fish and the monsters of the deep; for the sea encircling the island is reported to breed an incredible number of fish both of the smaller fry and of the monstrous sort, among the latter being some which have the heads of lions and of panthers and of other wild beasts, and also of rams; and, what is still a greater marvel, there are monsters which in all points of their shape resemble satyrs. Others are in appearance like women, but,

instead of having locks of hair, are furnished with prickles. It is even solemnly alleged that this sea contains certain strangely formed creatures, to represent which in a picture would baffle all the skill of the artists of the country, even though, with a view to make a profound sensation, they are wont to paint monsters which consist of different parts of different animals pieced together. These have their tails and the parts which are wreathed of great length, and have for feet either claws or fins. I learn further that they are amphibious. and by night graze on the pasture-fields, for they eat grass like cattle and birds that pick up seeds. They have also a great liking for the date when ripe enough to drop from the palms, and accordingly they twist their coils, which are supple, and large enough for the purpose, around these trees, and shake them so violently that the dates come tumbling down, and afford them a welcome repast. Thereafter when the night begins gradually to wane, but before there is yet clear daylight, they disappear by plunging into the sea just as the first flush of morning faintly illumines its surface. They say whales also frequent this sea, though it is not true that they come near the shore lying in wait for thunnies. The dolphins are reported to be of two sorts--one fierce and armed with sharp pointed teeth, which gives endless trouble to the fisherman, and is of a remorselessly cruel disposition, while the other kind is naturally mild and tame, swims about in the friskiest way, and is quite like a fawning dog. It does not run away when any one tries to stroke it, and it takes with pleasure any food it is offered.

The sea-hare, by which I now mean the kind found in the great sea (for of the kind found in the other sea I have already spoken), resembles in every particular the land hare except only the fur, which in the case of the land animal is soft and lies smoothly down, and does not resist the touch, whereas its brother of the sea has bristling hair which is prickly, and inflicts a wound on any one who touches it. It is said to swim atop of the sea-ripple without ever diving below, and to be very rapid in its movements. To catch it alive is no easy matter, as it never falls into the net, nor goes near the line and bait of the fishing rod. When it suffers, however, from disease, and being in consequence hardly able to swim, is cast out on shore, then if any one touches it with his hand death ensues if he is not attended to .-- nay, should one, were it only with a staff. touch this dead hare, he is affected in the same way as those who have touched a basilisk. But a root, it is said, grows along the coast of the island, well known to every one, which is a remedy for the swooning which ensues. It is brought close to the nostrils of the person who has fainted, who thereupon recovers consciousness. But should the remedy not be applied the injury proves fatal to life, so noxious is the vigour which this hare has at its command.

MEGASTHENES FRAGMENT 13

Of Indian Apes. (Aelian, Hist. Anim. 17. 39. Conf. Fragment 12. 2.)

In the country of the Praxii, who are an Indian people, Megasthenes says there are apes not inferior in size to the largest dogs. They have tails five cubits long, hair grows on their forehead, they have luxuriant beards hanging down their breast. Their face is entirely white, and all the rest of the body black. They are tame and. attached to man, and not malicious by nature like the apes of other countries.

MEGASTHENES FRAGMENT 14

Of Winged Scorpions and Serpents. (Aelian, Hist. Anim. XVI. 41. Conf. Fragm. 12. 4.)

Megasthenes says there are winged scorpions in India of enormous size, which sting Europeans and natives alike. There are also serpents which are likewise winged. These do not go abroad during the day; but by night, when they let fall urine, which if it lights upon any one's skin at once raises putrid sores thereon. Such is the statement of Megasthenes.

MEGASTHENES FRAGMENT 15.a

Of the Beasts of India, and the Reed. (Strabo, 15. 1. 56, pp.710-711.)

He (Megasthenes) says there are monkeys, rollers of rocks, which climb precipices whence they roll down stones upon their pursuers. Most animals, he says, which are tame with us are wild in India, and he speaks of horses which are onehorned and have heads like those of deer; and also of reeds some of which grow straight up to the height of thirty orguiae, while others grow along the ground to the length of fifty. They vary in thickness from three to six cubits in diameter.

MEGASTHENES FRAGMENT 15.b

There is also a race called the Skiratait whose country is beyond India. They are snub-nosed, either because in the tender years of infancy their nostrils are pressed down, and continue to be so throughout their after-life, or because such is the natural shape of the organ. Serpents of enormous size are bred in their country, of which some kinds seize the cattle when at pasture and devour them, while other kinds only suck the blood, as do the Aigithelai in Greece, of which I have already spoken in the proper place.

MEGASTHENES FRAGMENT 15.c

Of some Beasts of India. (Aelian, Hist. Anim. XVI. 20.21. Conf. Fragment 15. 2. 1.)

In certain districts of India (I speak of those which are most inland) they say there are inaccessible mountains infested by wild beasts, and which are also the haunts of animals like those of our own country except that they are wild; for even sheep, they say, ran wild there, as well as dogs and goats and oxen, which roam about at their own pleasure, being independent and free from the dominion of the herdsman That their number is beyond calculation is stated not only by writers on India, but also by the learned men of the country. among whom the Brachmans deserve to be reckoned, whose testimony is to the same effect. It is also said that there exists in India a one-horned animal, called by the natives the Kartazon. It is of the size of a full-grown horse, and has a crest, and yellow hair soft as wool. It is furnished with very good legs and is very fleet. Its legs are jointless and formed like those of the elephant, and it has a tail like a swine's. A horn sprouts out from between its eyebrows, and this is not straight, but carved into the most natural wreaths, and is of a black colour. It is said to be extremely sharp, this horn. The animal, as I learn, has a voice beyond all example loudringing and dissonant. It allows other animals to approach it, and is good-natured towards them, though they say that with its congeners it is rather quarrelsome. The males are reported to have a natural propensity not, only to fight among themselves, by butting with their horns, but to display a like animosity against the female, and to be so obstinate in their quarrels that they will not desist till a worsted rival is killed outright. But, again, not only is every member of the body of this animal endued with great strength, but such is the potency of its horn that nothing can withstand it. It loves to feed in secluded pastures, and wanders about alone, but at the rutting season it seeks the society of the female, and is then gentle towards her, -- nay, the two even feed in company. The season being over and the female pregnant, the Indian Kartazon again becomes ferocious and seeks solitude. The foals, it is said, are taken when quite young to the king of the Prasii, and are set to fight each other at the great public spectacles. No full-grown specimen is remembered to have ever been caught.

The traveller who crosses the mountains which skirt that frontier of India which is most inland meets, they say, with ravines which are clothed with very dense, jungle, in a district called by the Indians Korouda. These ravines are said to be the haunts of a peculiar kind of animal shaped like a satyr, covered all over with shaggy hair, and having a tail like a horse's, depending from its rump. If these creatures are left unmolested, they keep within the coppices, living on the wild fruits; but should they hear the hunter's halloo and the baying of the hounds they dart up the precipices with incredible speed. for they are habituated to climbing the mountains. They defend themselves by rolling down stones on their assailants, which often kill those they hit. The most difficult to catch are those which roll the stones. Some are said to have been brought, though with difficulty and after long intervals, to the Prasii, but these were either suffering from diseases or were females heavy with young, the former being too weak to escape, and the latter being impeded by the burden of the womb .-- [Conf. Pliny the Elder, Natural History, 7. 2. 17.]

MEGASTHENES FRAGMENT 16

Of the Boa-Constrictor. (Pliny the Elder, Natural History, 8. 14. 1.)

According to Megasthenes, serpents in India grow to such a size that they swallow stags and bulls whole. [Solinus, 52. 33. So huge are the serpents that they swallow stags whole, and other animals of equal size.]

MEGASTHENES FRAGMENT 17

Of the Electric Eel. (Aelian, Hist. Anim. 8. 7.) I learn from Megasthenes that there is in the Indian Sea a small kind of fish which is never seen when alive, as it always

small kind of fish which is never seen when alive, as it always swims in deep water, and only floats on the surface after it is dead. Should any one touch it he becomes faint [gets an electric shock] and swoons,--nay, even dies at last.

MEGASTHENES FRAGMENT 18

Of Taprobane. (Pliny the Elder, Natural History, 6. 24. 1. Megasthenes says that Taprobane is separated from the mainland by a river; that the inhabitants are called Palaigonoi, and, that their country is more productive of gold and large pearls than India. [Solin. 53.3. Taprobane is separated from India by a river flowing between: for one part of it abounds with wild beasts and elephants much larger than India breeds, and man claims the other part.] MEGASTHENES FRAGMENT 19

Of Marine Trees. (Antigon. Caryst. 647.) Megasthenes, the author of the Indika, mentions that trees grow in the Indian Sea. [He meant mangroves.]

MEGASTHENES FRAGMENT 20 a

Of the Indus and the Ganges. (Lucius Flavius Arrianus, The Indica, 4. 2-13.) See translation of Arrian.

MEGASTHENES FRAGMENT 20.b

The Rivers Indus and Ganges. (Pliny the Elder, Natural History, 6. 21.9-22. 1.)

The Prinas and the Cainas (a tributary of the Ganges) are both navigable rivers. The, tribes which dwell by the Ganges are the Calingae, nearest the sea, and higher up the Mandei, also the Malli, among whom is Mount Mallus, the boundary of all that region being the Ganges. Some have asserted that this river, like the Nile, rises from unknown sources, and in a similar way waters the country it flows through, while others trace its source to the Skythian mountains. Nineteen rivers are said to flow into it, of which, besides those already mentioned. the Condochates, Erannoboas, Cosoagus, and Sonus are navigable. According to other accounts, it bursts at once with thundering roar from its fountain, and tumbling down a steep and rocky channel lodges in a lake as soon as it reaches the level plain, whence it issues forth with a gentle current, being nowhere less than eight miles broad, while its mean breadth is a hundred stadia, and its least depth twenty fathoms. [Solin. 52, 6-7. In India the largest rivers are the Ganges and the Indus,--the Ganges, as some maintain, rising from uncertain sources, and, like the Nile, overflowing its banks; while others think that it rises in the Skythian mountains. In India there is also the Hupanis, a very noble river, which formed the limit of Alexander's march, as the altars set up on its banks testify. The least breadth of the Ganges is eight miles, and the greatest twenty. Its depth where least is fully one hundred feet. (Conf. Fragm. 25.1. Some say that the least breadth is thirty stadia, but others only three; while Megasthenes says that the mean breadth is a hundred stadia, and its least depth twenty orguiae.)]

MEGASTHENES FRAGMENT 21

Of the River Silas. (Lucius Flavius Arrianus, The Indica, 6. 2-3.) See translation of Arrian.

MEGASTHENES FRAGMENT 22

Of the River Silas. (Boissonade, Anecd. Graec. 1. p.419.) There is in India a river called the Silas, named after the fountain from which it flows, on which nothing will float that is thrown into it, but everything sinks to the bottom, contrary, to the usual law.

MEGASTHENES FRAGMENT 23

Of the River Silas. (Strabo, 15. 1. 38, -- p. 703.)

(Megasthenes says) that in the mountainous country is a river, the Silas, on the waters of which nothing will float. Demokritos, who had travelled over a large part of Asia, disbelieves this, and so does Aristotle.

MEGASTHENES FRAGMENT 24

Of the Number of Indian Rivers. (Lucius Flavius Arrianus, The Indica, 5. 2.) See translation of Arrian.

INDIKA BOOK 2.

MEGASTHENES FRAGMENT 25

Of the city Pataliputra [the today's Patna]. (Strabo. 15. 1. 35-36, p.702.)

According to Megasthenes the mean breadth (of the Ganges) is 100 stadia, and its least depth 20 fathoms. At the meeting of this river and another is situated Palibothra, a city eighty stadia in length and fifteen in breadth. It is of the shape of a parallelogram, and is girded with a wooden wall, pierced with loopholes for the discharge of arrows. It has a ditch in front for defence and for receiving the sewage of the city. The people in whose country this city is situated is the most distinguished in all India, and is called the Prasii. The king, in addition to his family name, must adopt the surname of Palibothros, as Sandrakottos, for instance, did, to whom Megasthenes was sent on an embassy. [This custom also prevails among the Parthians, for all are called Arsakai, though each has his own peculiar name, as Orodes, Phraates, or some other.]

Then follow these words:-- All the country beyond the Hupanis is allowed to be very fertile, but little is accurately known regarding it. Partly from ignorance and the remoteness of its situation, everything about it is exaggerated or represented as marvellous: for instance, there are the stories of the gold-digging ants, of animals and men of peculiar shapes, and possessing wonderful faculties; as the Seres, who, they say, are so long-lived that they attain an age beyond that of two hundred years. They mention also an aristocratical form of government consisting of five thousand councillors, each of whom furnishes the state with an elephant.

According to Megasthenes the largest tigers are found in the country of the Prasii, etc. (Cf. Fragm. 12.)

MEGASTHENES FRAGMENT 26

Of Pataliputra and the Manners of the Indians. (Lucius Flavius Arrianus, The Indica, 10.)

It is farther said that the Indians do not rear monuments to the dead, but consider the virtues which men have displayed in life, and the songs in which their praises are celebrated. sufficient to preserve their memory after death. But of their cities it is said that the number is so great that it cannot be stated with precision, but that such cities as are situated on the banks of rivers or on the sea-coast are built of wood instead of brick, being meant to last only for a time, --so destructive are the heavy rains which pour down, and the rivers also when they overflow their banks and inundate the plains,--while those cities which stand on commanding situations and lofty eminences are built of brick and mud; that the greatest city in India is that which is called Palimbothra, in the dominions of the Prasians, where the streams of the Erannoboas and the Ganges unite,--the Ganges being the greatest of all rivers, and the Erannoboas being perhaps the third largest of Indian rivers, though greater than the greatest rivers elsewhere; but it is smaller than the Ganges where it falls into it. Megasthenes informs us that this city stretched in the inhabited quarters to an extreme length on each side of eighty stadia, and that its breadth was fifteen stadia, and that a ditch encompassed it all round, which was six hundred feet in breadth and thirty cubits in depth, and that the wall was crowned with 570 towers and had four-andsixty gates. The same writer tells us further this remarkable fact about India, that all the Indians are free, and not one of them is a slave. The Lakedaemonians, and the Indians are here so far in agreement. The Lakedaemonians, however, hold the Helots as slaves, and these Helots do servile labour; but the Indians do not even use aliens as slaves, and much less a countryman of their own.

MEGASTHENES FRAGMENT 27.a

Of the Manners of the Indians. (Strabo. 15. 1. 53-56, pp.709-10.)

The Indians all live frugally, especially when in camp. They dislike a great undisciplined multitude, and consequently they observe good order. Theft is of very rare occurrence. Megasthenes says that those who were in the camp of Sandrakottos, wherein lay 400,000 men, found that the thefts reported on any one day did not exceed the value of two hundred drachmae, and this among a people who have no written laws, but are ignorant of writing, and must therefore in all the business of life trust to memory. They live, nevertheless, happily enough, being simple in their manners and frugal. They never drink wine except at sacrifices. Their beverage is a liquor composed from rice instead of barley, and their food is principally a rice-pottage. The simplicity of their laws and their contracts is proved by the fact that they seldom go to law. They have no suits about pledges or deposits, nor do they, require either seals or witnesses, but make their deposits and confide in each other. Their houses and property they generally leave unguarded. These things indicate that they possess good, sober sense; but other things they do which one cannot approve: for instance, that they eat always alone, and that they have no fixed

hours when meals are to be taken by all in common, but each one eats when he feels inclined. The contrary custom would be better for the ends of social and civil life.

Their favourite mode of exercising the body is by friction applied in various ways, but especially by passing smooth ebony rollers over the skin. Their tombs are plain, and the mounds raised over the dead lowly. In contrast to the general simplicity of their style, they love finery and ornament. Their robes are worked in gold, and ornamented with precious stones, and they wear also flowered garments made of the finest muslin. Attendants walking behind hold up umbrellas over them: for they have a high regard for beauty, and avail themselves of every device to improve their looks. Truth and virtue they hold alike in esteem. Hence they accord no special privileges to the old unless they possess superior wisdom. They marry many wives, whom they buy from their parents, giving in exchange a yoke of oxen. Some they marry hoping to find in them willing helpmates; and others for pleasure and to fill their houses with children. The wives prostitute themselves unless they are compelled to be chaste. No one wears a crown at a sacrifice or libation, and they do not stab the victim, but strangle it, so that nothing mutilated, but only what is entire, may be presented to the deity.

A person convicted of bearing false witness suffers mutilation of his extremities, He who maims any one not only suffers in return the loss of the same limb, but his hand also is cut off. If he causes an artizan to lose his hand or his eye, he is put to death. The same writer says that none of the Indians employ slaves; [but Onesikritos says that this was peculiar to that part of the country over which Musikanos ruled.]

The care of the king's person is entrusted to women, who also are bought from their parents. The guards and the rest of the soldiery attend outside the gates. A woman who kills the king when drunk becomes the wife of his successor. The sons succeed the father. The king may not sleep during the daytime, and by night he is obliged to change his couch from time to time, with a view to defeat plots against his life.

The king leaves his palace not only in time of war, but also for the purpose of judging causes. He then remains in court for the whole day, without allowing the business to be interrupted, even though the hour arrives when he must needs attend to his person, -- that is, when he is to be rubbed with cylinders of wood. He continues hearing cases while the friction, which is performed by four attendants, is still proceeding. Another purpose for which he leaves his palace is to offer sacrifice; a third is to go to the chase, for which he departs in Bacchanalian fashion. Crowds of women surround him, and outside of this circle spearmen are ranged. The road is marked off with ropes, and it is death, for man and woman alike, to pass within the ropes. Men with drums and gongs lead the procession. The king hunts in the enclosures and shoots arrows from a platform. At his side stand two or three armed women. If he hunts in the open grounds he shoots from the back of an elephant. Of the women, some are in chariots, some on horses, and. some even on elephants, and they are equipped with weapons of every kind, as if they were going on a campaign.

[These customs are very strange when compared with our own, but the following are still more so;] for Megasthenes states that the tribes inhabiting the Kaukasos have intercourse with women in public, and eat the bodies of their relatives, that there are monkeys which roll down stones, etc.. (Fragm. XV. follows, and then Fragm. XXIX.)

MEGASTHENES FRAGMENT 27.b

(Aelian. 5. 50. 4.1.)

The Indians neither put out money at usury, nor know how to borrow. It is contrary to established usage for an Indian either to do or suffer a wrong, and therefore they neither make contracts nor require securities. [Conf. Suid. 5.]

MEGASTHENES FRAGMENT 27.c

(Nicol. Damasc. 44; Stob. Serm. 42.)

Among the Indians one who is unable to recover a loan or a deposit has no remedy at law. All the creditor can do is to blame himself for trusting a rogue.

MEGASTHENES FRAGMENT 27.d

(Nicol. Damasc. 44; Stob. Serm. 42.)

He who causes an artisan to lose his eye or his hand is put to death. If one is guilty of a very heinous offence the king orders his hair to be cropped, this being a punishment to the last degree infamous.

MEGASTHENES FRAGMENT 28

Of the Suppers of the Indians. (Athen: 4. p. 153.)

Megasthenes, in the second book of his Indika, says that when the Indians are at supper a table is placed before each person, this being like a tripod. There, is placed upon it a golden bowl, into which they first put rice, boiled as one would boil barley, and then they add many dainties prepared according to Indian receipts.

MEGASTHENES FRAGMENT 29

Of fabulous tribes. (Strabo 15. 1. 57, p.711.)

But deviating into fables he says there are men five spans and even three spans in height, some of whom want the nose, having only two orifices above the mouth through which they breathe. Against the men of three spans, war, as Homer has sung, is waged by the cranes, and also by partridges, which are as large as geese. These people collect and destroy the eggs of the cranes, for it is in their country the cranes lay their eggs, and thus the eggs and the young cranes are not to be found anywhere else. Frequently a crane escapes having the brazen point of a weapon in its body, from wounds received in that country. Equally absurd is the account given of the Enotokoitai, of the wild men, and of other monsters. The wild men could not be brought to Sandrakottos, for they refused to, take food and died. Their heels are in front, and the instep and toes are turned backwards. Some were brought to the court who had no mouths and were tame. They dwell near the sources of the Ganges, and subsist on the savour of roasted flesh and the perfumes of fruits and flowers, having instead of mouths orifices through which they breathe. They are distressed with things of evil smell, and hence it is with difficulty they keep their hold on life, especially in a camp. Referring to the other monstrosities, the philosophers told him of the Okupedes, a people who in running could leave the horse behind; of the Enotokoitai, who had ears reaching down to their feet, so that they could sleep in them, and were so strong that they could pull up trees and break a bowstring. Of others the Monommatoi, who have the ears of a dog, their one eye set in the middle of their forehead, the hair standing erect, and their breasts shaggy; of the Amukteres also, a people without nostrils, who devour everything, eat raw meat, and are short-lived, and die before old age supervenes. The

upper part of the mouth protrudes far over the lower lip. With regard to the Hyperboreans, who live a thousand years, they give the same account as Simonides, Pindaros, and other mythological writers. The story told by Timagenes, that showers fall of drops of copper, which are swept together, is a fable. Megasthenes states--what is more open to belief, since the same is the case in Iberia--that the rivers carry down gold dust, and that a part of this is paid by way of tribute to the king.

MEGASTHENES FRAGMENT 30.a

Of fabulous races. (Pliny the Elder, Natural History, 7. 2. 14-22.)

According to Megasthenes, on a mountain called Nulo there live men whose feet are turned backward, and who have eight toes on each foot; while on many of the mountains there lives a race of men having heads like those of dogs, who are clothed with the skins of wild beasts, whose speech is barking, and who, being armed with claws, live by hunting and fowling. [Ktesias asserts on his own authority that the number of these men was upwards of 120,000, and that there is a race in India whose females bear offspring but once in the course of their life, and that their children become at once grey-haired.]

Megasthenes speaks of a race of men among the Nomadic Indians who instead of nostrils have merely orifices, whose legs are contorted like snakes, and who are called Scyritae. He speaks also of a race living on the very confines of India on the east, near the source of the Ganges, the Astomi who have no mouth; who cover their body, which is all over hairy, with the soft down found upon the leaves of trees; and who live merely by breathing, and the perfume inhaled by the nostrils. They eat nothing, and they drink nothing. They require merely a variety of odours of roots and of flowers and of wild apples. The apples they carry with them when they go on a distant journey, that they may always have something to smell. Too strong an odour would readily kill them.

Beyond the Astomi, in the remotest part of the mountains, the Trispithami and the Pygmies are said to have their abode. They are each three spans in height--that is, not more than seven-and-twenty inches. Their climate is salubrious and they enjoy a perpetual spring, under shelter of a barrier of mountains which rise on the north. They are the same whom Homer mentions as being harassed by the attacks of the cranes. The story about them is--that mounted on the backs of rams and goats, and equipped with arrows, they march down in spring-time all in a body to the sea; and destroy the eggs and the young of these birds. It takes them always three months to finish this yearly campaign, and were it not undertaken they could not defend themselves against the vast flocks of subsequent years. Their hats are made of clay and feathers and egg-shells. [Aristotle says that they live in caves, but otherwise he gives the same account of them as others.]

[From Ktesias we learn that there is a people belonging to this race, which is called Pandore and settled in the valleys, who live two hundred years, having in youth hoary hair, which in old age turns black. On the other hand, others do not live beyond the age of forty,--nearly related to the Macrobii, whose women bear offspring but once. Agatharchides says the same of them, adding that they subsist on locusts, and are swift of foot.] Clitarchus and Megasthenes call them Mandi and reckon the number of their villages at three, hundred. The females bear children at the age of seven, and are old women at forty.

MEGASTHENES FRAGMENT 30.b

(Solin. 52. 26-30.)

Near a mountain which is called Nulo there live men whose feet are turned backwards and have eight toes on each foot. Megasthenes writes that on different mountains in India there are tribes of men with dog-shaped heads, armed with claws, clothed with skins, who speak not in the accents of human language, but only bark, and have fierce grinning jaws. [In Ktesias we read that in some parts the females bear offspring but once, and that the children are white-haired from their birth, etc.]

Those who live near the source of the Ganges, requiring nothing in the shape of food, subsist on the odour of wild apples, and when they go on a long journey they carry these with them for safety of their life, which they can support by inhaling their perfume. Should they inhale very foul air, death is inevitable.

MEGASTHENES FRAGMENT 31

Plutarch, de facie in orbe lunae. Of the race of men without mouths. (Opp. ed. Reisk, vol. 9. p.701.)

For how could one find growing there that Indian root which Megasthenes says a race of men who neither eat nor drink, and in fact have not even mouths, set on fire and burn like incense, in order to sustain their existence with its odorous fumes, unless it received moisture from the moon--

INDIKA BOOK 3.

MEGASTHENES FRAGMENT 32

(Lucius Flavius Arrianus, The Indica, 11.1.-12.9. Cf. Epit.40-53, and Pliny the Elder, Natural History, 6. 22. 2, 3.) (See the translation of Arrian's Indica.)

MEGASTHENES FRAGMENT 33

Of the Seven Castes among the Indians. (Strabo 15. 1. 39-41, 46-49, pp.703-4, 707.)

According to him (Megasthenes) the population of India is divided into seven parts. The philosophers are first in rank, but form the smallest class in point of number. Their services are employed privately by persons who wish to offer sacrifices or perform

other sacred rites, and also publicly by the kings at what is called the Great Synod, wherein at the beginning of the new year all the philosophers are gathered together before the king at the gates, when any philosopher who may have committed any useful suggestion to writing, or observed any means for improving the crops and the cattle, or for promoting the public interests, declares it publicly. If any one is detected giving false information thrice, the law condemns him to be silent for the rest of his life, but he who gives sound advice is exempted from paying any taxes or contributions.

The second caste consists of the husbandmen, who form, the bulk of the population, and are in disposition most mild and gentle. They are exempted from military service, and cultivate their lands undisturbed by fear. They never go to town, either to take part in its tumults, or for any other purpose. It therefore not infrequently happens that at the same time, and in the same part of the country, men may be seen drawn up in array of battle and fighting at risk of their lives, while other men close at hand are ploughing and digging in perfect security, having these soldiers to protect them. The whole of the land is the property of the king, and the husbandmen till it on condition of receiving one-fourth of the produce.

The third caste consists of herdsmen and hunters, who alone are allowed to hunt, and to keep cattle, and to sell draught animals or let them out on hire. In return for clearing the land of wild beasts and fowls which devour the seeds sown in the fields, they receive an allowance of grain from the king. They lead a wandering life and live under tents.

The fourth class, after herdsmen and hunters, consists of those who work it trades, of those who vend wares, and of those who are employed in bodily labour. Some of these pay tribute, and render to the state certain prescribed services. But the armour-makers and shipbuilders receive wages and their victuals from the king, for whom alone they work. The general in command of the army supplies the soldiers with weapons, and the admiral of the fleet lets out ships on hire for the transport both of passengers and merchandize.

The fifth class consists of fighting men, who, when not engaged in active service, pass their time in idleness and drinking. They are maintained at the king's expense, and hence they are always ready, when occasion calls, to take the field, for they carry nothing of their own with them but their own bodies.

The sixth class consists of the overseers, to whom is assigned the duty of watching all that goes on, and making reports secretly to the king. Some are entrusted

with the inspection of the city, and others with that of the army. The former employ as their coadjutors the courtezans of the city, and the latter the courtezans of the camp. The ablest and most trustworthy men are appointed to fill these offices.

The seventh class consists of the councillors and assessors of the king. To them belong the highest posts of government, the tribunals of justice, and the general administration of public affairs. No one is allowed to marry out of his own caste, or to exchange one profession or trade for another, or to follow more than one business. An exception is made in favour of the philosopher, who for his virtue is allowed this privilege.

MEGASTHENES FRAGMENT 34

(Strabo 15. 1. 50-52, pp.707-709.)

Of the administration of public affairs. Of the use of Horses and Elephants.

Of the great officers of state, some have charge of the market, others of the city, others of the soldiers. Some superintend the rivers, measure the land, as is done in Egypt, and inspect the sluices by which water is let out from the main canals into their branches, so that every one may have an equal supply of it. The same persons have charge also of the huntsmen, and are entrusted with the power of rewarding or punishing them according to their deserts. They collect the taxes, and superintend the occupations connected with land; as those of the woodcutters, the carpenters, the blacksmiths. and the miners. They construct roads, and at every ten stadia set up a pillar to show the by-roads and distances. Those who have charge of the city are divided into six bodies of five each The members of the first look after everything relating to the industrial arts. Those of the second attend to the entertainment of foreigners. To these they assign lodgings, and they keep watch over their modes of life by means of those persons whom they give to them for assistants. They escort

THE GRAND BIBLE

them on the way when they leave the country, or, in the event of their dying, forward their property to their relatives. They take care of them when they are sick, and if they die bury them. The third body consists of those who inquire when and how births and deaths occur, with the view not only of levying a tax, but also in order that births and deaths among both high and low may not escape the cognizance of Government. The fourth class superintends trade and commerce. Its members have charge of weights and measures, and see that the products in their season are sold by public notice. No one is allowed to deal in more than one kind of commodity unless he pays a double tax. The fifth class supervises manufactured articles, which they sell by public notice. What is new is sold separately from what is old, and there is a fine for mixing the two together. The sixth and last class consists of those who collect the tenths

of the prices of the articles sold. Fraud, in the payment of this tax is punished with death. Such are the functions which these bodies separately discharge. In their collective capacity they have charge both of their special departments, and also of matters affecting the general interest, as the keeping of public buildings in proper repair, the regulation of prices, the care of markets, harbours, and temples. Next to the city magistrates there is a third governing body, which directs military affairs. This also consists of six divisions, with five members to each. One division is appointed to cooperate with the admiral of the fleet, another with the superintendent of the bullock-trains which are used for transporting engines of war, food for the soldiers, provender for the cattle, and other military requisites. They supply servants who beat the drum, and others who carry gongs; grooms also for the horses, and mechanists and their assistants. To the sound of the gong they send out foragers to bring in grass, and by a system of rewards and punishments ensure the work being done with despatch and safety. The third division has charge of the foot-soldiers, the fourth of the horses, the fifth of the war-chariots, and the sixth of the elephants. There are royal stables for the horses and elephants, and also a royal magazine for the arms, because the soldier has to return his arms to the magazine, and his horse and his elephant to the stables. They use the elephants without bridles. The chariots are drawn on the march by oxen. but the horses are led along by a halter, that their legs may not be galled and inflamed, nor their spirits damped by drawing chariots. In addition to the charioteer, there are two fighting men who sit up in the chariot beside him. The warelephant carries four men--three who shoot arrows, and the driver.

MEGASTHENES FRAGMENT 35

Of the use of Horses and Elephants. (Aelian, Hist. Anim. 13. 10.)

When it is said that an Indian by springing forward in front of a horse can check his speed and hold him back, this is not true of all Indians, but only of such as have been trained from boyhood to manage horses; for it is a practice with them to control their horses with bit and bridle, and to make them move at a measured pace and in a straight course. They neither, however, gall their tongue by the use of spiked muzzles, nor torture the roof of their mouth. The professional trainers break them in by forcing them to gallop round and round in a ring, especially when they see them refractory. Such as undertake this work require to have a strong hand as well as a thorough knowledge of horses. The greatest proficients test their skill by driving a chariot round and round in a ring; and in truth it would be no trifling feat to control with ease a team of four high-mettled steeds when whirling round in a circle. The chariot carries two men who sit beside the charioteer. The war-elephant, either in what is called the tower, or on his bare back in sooth, carries three fighting men, of whom two shoot from the side, while one shoots from behind. There is also a fourth man, who carries in his hand the goad wherewith he guides the animal, much in the same way as the pilot and captain of a ship direct its course with the helm.

MEGASTHENES FRAGMENT 36

Of Elephants. (Strabo 15. 1. 41-43, pp.704-705.) A private person is not allowed to keep either a horse or an elephant. These animals are held to be the special property of the king, and persons are appointed to take care of them. The manner of hunting the elephant is this. Round a bare patch of ground is dug a deep trench about five or six stadia in extent. and over this is thrown a very narrow bridge which gives access to the enclosure. Into this enclosure are introduced three or four of the best-trained female elephants. The men themselves lie in ambush in concealed huts. The wild elephants do not approach this trap in the daytime, but they enter it at night, going in one-by-one. When all have passed the entrance, the men secretly close it up; then, introducing the strongest of the tame fighting elephants, they fight it out with the wild ones, whom at the same time they enfeeble with hunger. When the latter are now overcome with fatigue, the boldest of the drivers dismount unobserved, and each man creeps under his own elephant, and from this position creeps under the belly of

the wild elephant and ties his feet together. When this is done they incite the tame ones to beat those whose feet are tied till they fall to the ground. They then bind the wild ones and the tame ones together neck to neck with thongs of raw ox-hide. To prevent them shaking themselves in order to throw off those who attempt to mount them, they make cuts all round their neck and then put thongs of leather into the incisions so that the pain obliges them to submit to their fetters and to remain quiet. From the number caught they reject such as are too old or too young to be serviceable, and the rest they lead away to the stables. Here they tie their feet one to another, and fasten their necks to a firmly fixed pillar, and tame them by hunger. After this they restore their strength with green reeds and grass. They next teach them to be obedient, which they effect by soothing them, some by coaxing words, and others by songs and the music of the drum. Few of them are found difficult to tame, for they are naturally so mild and gentle in their disposition that they approximate to rational creatures. Some of them take up their drivers when fallen in battle, and carry them off in safety from the field. Others, when their masters have sought refuge between their forelegs, have fought in their defence and saved their lives. If in a fit of anger they kill either the man who feeds or the man who trains them, they pine so much for their loss that they refuse to take food, and sometimes die of hunger.

They copulate like horses, and the female casts her calf chiefly in spring. It is the season for the male, when he is in heat and becomes ferocious. At this time he discharges a fatty substance through an orifice near the temples. It is also the season for the females, when the corresponding passage opens. They go with young for a period which varies from sixteen to eighteen months. The dam suckles her calf for six years. Most of them live as long as men who attain extreme longevity, and some live over two hundred years. They are liable to many distempers, and are not easily cured. The remedy for diseases of the eye is to wash it with, cows' milk. For most of their other diseases draughts of black wine are administered to them. For the cure of their wounds they are made to swallow butter, for this draws out iron. Their sores are fomented with swine's flesh.

MEGASTHENES FRAGMENT 37.a

(Lucius Flavius Arrianus, The Indica, ch. 13-14.) (See the translation of Arrian's Indika.)

MEGASTHENES FRAGMENT 37.b

Of Elephants. (Aelian, Hist. Anim. XII. 44.)

In India an elephant if caught when full-grown is difficult to tame, and longing for freedom thirsts for blood. Should it be bound in chains, this exasperates it still more, and it will not submit to a master. The Indians, however, coax it with food, and seek to pacify it with various things for which it has a liking, their aim being to fill its stomach and to soothe its temper. But it is still angry with them, and takes no notice of them. To what device do they then resort? They sing to it their native melodies, and soothe it with the music of an instrument in common use which has four strings and is called a skindapsos. The creature now pricks up its ears, yields to the soothing strain, and its anger subsides. Then, though there is an occasional outburst of its suppressed passion, it gradually turns its eve to its food. It is then freed from its bonds, but does not seek to escape, being enthralled with the music. It even takes food eagerly, and, like a luxurious guest riveted to the festive board, has no wish to go, from its love of the music.

MEGASTHENES FRAGMENT 38

Of the diseases of Elephants. (Aelian, Hist. Anim. 13. 7.) The Indians cure the wounds of the elephants which they catch, in the manner following:--

They treat them in the way in which, as good old Homer tells us, Patroklos treated the wound of Euryplyos,--they foment them with lukewarm water. After this they rub them over with butter, and if they are deep allay the inflammation by applying and inserting pieces of pork, hot but still retaining the blood. They cure ophthalmia with cows' milk, which is first used as a fomentation for the eye, and is then injected into it. The animals open their eyelids, and finding they can see better are delighted, and are sensible of the benefit like human beings. In proportion as their blindness diminishes their delight overflows, and this is a token that the disease has been cured. The remedy for other distempers to which they are liable is black wine; and if this potion fails to work a cure nothing else can save them.

MEGASTHENES FRAGMENT 39

Of Gold-digging Ants. (Strabo 15. 1. 44, p.706.) Megasthenes gives the following account of these ants. Among the Derdai, a great tribe of Indians, who inhabit the mountains on the eastern borders, there is an elevated plateau about 3,000 stadia, in circuit. Beneath the surface there are mines of gold, and here accordingly are found the ants which dig for that metal. They are not inferior in size to wild foxes. They run with amazing speed, and live by the produce of the chase. The time when they dig is winter. They throw up heaps of earth, as moles do, at the mouth of the mines. The golddust has to be subjected to a little boiling. The people of the neighbourhood, coming secretly with beasts of burden, carry this off. If they came openly the ants would attack them, and pursue them if they fled, and would destroy both them and their cattle. So, to effect the robbery without being observed, they lay down in several different places pieces of the flesh of wild beasts, and when the ants are by this device dispersed they carry off the gold-dust. This they sell to any trader they meet with while it is still in the state of ore, for the art of fusing metals is unknown to them.

MEGASTHENES FRAGMENT 40.a

(Lucius Flavius Arrianus, The Indica, XV.5-7.) (See the translation of Arrian's Indika.)

MEGASTHENES FRAGMENT 40.b

Of Ants which dig.for gold. (Dio Chrysostom Or. 35,--p. 436, Morell.)

They get the gold from ants. These creatures are larger than foxes, but are in other respects like the ants of our own country. They dig holes in the earth like other ants. The heap which they throw up consists of gold the purest and brightest in all the world. The mounds are piled up close to each other in regular order like hillocks of gold dust, whereby all the plain is made effulgent. It is difficult, therefore, to look towards the sun, and many who have attempted to do this have thereby destroyed their eyesight. The people who are next neighbours to the ants, with a view to plunder these heaps, cross the intervening desert, which is of no great extent, mounted on wagons to which they have yoked their swiftest horses. They arrive at noon, a time when the ants have gone underground, and at once seizing the booty make off at full speed. The ants, on learning what has been done, pursue the fugitives, and overtaking them fight with them till they conquer or die, for of all animals they are the most courageous. It hence appears that they understand the worth of gold, and that they will sacrifice their lives rather than part with it.

MEGASTHENES FRAGMENT 41

Of the Indian Philosophers. (Strabo 15. 1. 58-60, pp.711-714.)

Speaking of the philosophers, he (Megasthenes) says that such of them as live, on the mountains are worshippers of Dionysos, showing as proofs that he had come among them the wild vine, which grows in their country only, and the ivy, and the laurel, and the myrtle, and the box-tree. and other evergreens, none of which are found beyond the Euphrates. except a few in parks, which it requires great care to preserve. They observe also certain customs which are Bacchanalian. Thus they dress in muslin, wear the turban, use perfumes array themselves in garments dyed of bright colours; and their kings, when they appear in public, are preceded by the music of drums and gongs. But the, philosophers who live on the plains worship Herakles. [These accounts are fabulous, and are impugned by many writers, especially what is said about the vine and wine. For the greater part of Armenia, and the whole of Mesopotamia and Media, onwards to Persia and Karmania, lie beyond the Euphrates, and throughout a great part of each of these countries good vines grow, and good wine is produced.]

Megasthenes makes a different division of the philosophers, saying that they are of two kinds--one of which he calls the Brachmanes, and the other the Sarmanes. The Brachmanes are best esteemed, for they are more consistent in their opinions. From the time of their conception in the womb they are under the guardian care of learned men, who go to the mother and, under the pretence of using some incantations for the welfare of herself and her unborn babe, in reality give her prudent hints and counsels. The women who listen most willingly are thought to be the most fortunate in their children. After their birth the children are under the care of one person after another, and as they advance in age each succeeding master is more accomplished than his predecessor. The philosophers have their abode in a grove in front of the city within a moderate-sized enclosure. They live in a simple style, and lie on beds of rushes or (deer) skins. They abstain from animal food and sexual pleasures, and spend their time in listening to serious discourse, and in imparting their knowledge to such as will listen to them. The hearer is not allowed to speak, or even to cough, and much less to spit, and if he offends in any of these ways he is cast out from their society that very day, as being a man who is wanting in self-restraint. After living in this manner for seven-and-thirty years, each individual retires to his own property, where he lives for the rest of his days in ease and serenity. They then array themselves in fine muslin, and wear a few trinkets of gold on their fingers and in their ears. They eat flesh but not that of animals employed in labour. They abstain from hot and highly seasoned food. They marry as many wives as they please, with a view to have numerous children, for by having many wives greater advantages are enjoyed, and, since they have no slaves, they have more need to have children around them to attend to

their wants. The Brachmanes do not communicate a knowledge of philosophy to their wives, lest they should. divulge any of the forbidden mysteries to the profane if they became depraved, or lest they should, desert them if they became good philosophers: far no one who despises pleasure and pain, as well as life and death, wishes to be in subjection to another, but this is characteristic both of a good man and of a good woman. Death is with them a very frequent subject of discourse. They regard this life as, so to speak, the time when the child within the womb becomes mature, and death as a birth into a real and happy life for the votaries of philosophy. On this account they undergo much, discipline as a preparation for death. They consider nothing that befalls men to be either good or bad, to suppose otherwise being a dream-like illusion, else how could some be affected with sorrow, and others with pleasure, by the very same things, and how could the same things affect the same individuals at different times with these opposite emotions? Their ideas about physical phenomena, the same author tells us, are very crude, for, they are better in their actions than in their reasonings, inasmuch as their belief is in great measure based upon fables; yet on many points their opinions coincide with those of the Greeks, for like them they say that the world had a beginning, and is liable to destruction, and is in shape spherical, and that the Deity who made it, and who governs it, is diffused through all its parts. They hold that various first principles operate in the universe, and that water was the principle employed in the making of the world. In addition to the four elements there is a fifth agency, from which the heaven and the stars were produced. The earth is placed in the centre of the universe. Concerning generation, and the nature of the soul, and many other subjects, they express views like those maintained by the Greeks. They wrap up their doctrines about immortality and future judgement, and kindred topics, in allegories, after the manner of Plato. Such are his statements regarding the Brachmanes.

Of the Sarmanes he tells us that those who are held in most honour are called the Hylobioi. They live in the woods, where they subsist on leaves of trees and wild fruits, and wear garments made from the bark of trees. They abstain from sexual intercourse and from wine. They communicate with the kings, who consult them by messengers regarding the causes of things, and who through them worship and supplicate the deity. Next in honour to the Hylobioi are the physicians, since they are engaged in the study of the nature of man. They are simple in their habits, but do not live in the fields. Their food consists of rice and barley-meal, which they can always get for the mere asking, or receive from those who entertain them as guests in their houses. By their knowledge of pharmacy they can make marriages fruitful, and determine the sex of the offspring. They effect cures rather by regulating diet than by the use of medicines. The remedies most esteemed are ointments and plasters. All others they consider to be in a great measure pernicious in their nature. This class and the other class practise fortitude, both by undergoing active toil, and by the endurance of pain, so that they remain for a whole day motionless in one fixed attitude.

Besides these there are diviners and sorcerers, and adepts in the rites and customs relating to the dead, who go about begging both in villages and towns. Even such of them as are of superior culture and refinement inculcate such superstitions regarding Hades as they consider favourable to piety and holiness of life. Women pursue philosophy with some of them, but abstain from sexual intercourse.

MEGASTHENES FRAGMENT 42.a

(Titus Flavius Clemens of Alexandria, Stromata 1. p. 305 D; ed. Colon. 1688)

That the Jewish race is by far the oldest of all these, and that their philosophy, which has been committed to writing, preceded the philosophy of the Greeks, Philo the Pythagorean shows by many arguments, as does also Aristoboulos the Peripatetic, and many others, whose names I need not waste time in enumerating. Megasthenes, the author of a work on India, who lived with Seleukos Nikator, writes most clearly on this point, and his words are these:-- "All that has been said regarding nature by the ancients is asserted also by philosophers out of Greece, on the one part in India by the Brachmanes, and on the other in Syria by the people called the Jews."

MEGASTHENES FRAGMENT 42.b

(Eusebius of Caesarea, Praep. Ev. 9. 6, pp.410 C, D; ed. Colon. 1688). Ex Clem. Alex.

Again, in addition to this, further on he writes thus: "Megasthenes, the writer who lived with Seleukos Nikator, writes most clearly on this point and to this effect:--'All that has been said," etc.

MEGASTHENES FRAGMENT 42.c

Cyrill. Contra Julian. 4. (Opp. ed. Paris, 1638, T. VI. p. 134 Al. Ex Clem. Alex.)

Aristoboulos the Peripatetic somewhere writes to this effect:--"All that has been said," etc.

MEGASTHENES FRAGMENT 43

Of the Philosophers of India. (Titus Flavius Clemens of Alexandria, Stromata 1. p. 305, A, B; ed. Colon. 1688).

[Philosophy, then; with all its blessed advantages to man, flourished long ages ago among the barbarians, diffusing its light among the Gentiles, and eventually penetrated into Greece. Its hierophants were the prophets among the Egyptians, the Chaldaeans among the Assyrians, the Druids among the Gauls, the Sarmanaeans who were the philosophers of the Baktrians and the Kelts, the Magi among the Persians, who, as you know, announced beforehand the birth of the Saviour, being led by a star till they arrived in the land of Judaea, and among the Indians the Gymnosophists, and other philosophers of barbarous nations.]

There are two sects of these Indian philosophers--one called the Sarmanai and the other the Brachmanai. Connected with the Sarmanai are the philosophers called the Hylobioi, who neither live in cities nor even in houses. They clothe themselves with the bark of trees, and subsist upon acorns, and drink water by lifting it to their mouth with their hands. They neither marry nor beget children [like those ascetics of our own day called the Enkratetai. Among the Indians are those philosophers also who follow the precepts of Boutta, whom they honour as a god on account of his extraordinary sanctity.]

MEGASTHENES FRAGMENT 44

Of Kalanos and Mandanis. (Strabo 15. 1. 68, p.718.) Megasthenes, however, says that self-destruction is not a dogma of the philosophers, but that such as commit the act are regarded as foolhardy, those naturally of a severe temper stabbing themselves or casting themselves down a precipice, those averse to pain drowning themselves, those capable of enduring pain strangling themselves, and those of ardent temperaments throwing themselves into the fire. Kalanos was a man of this stamp. He was ruled by his passions, and became a slave to the table of Alexander. He is on this account condemned by his countrymen, but Mandanis is applauded because when messengers from Alexander invited him to go to the son of Zeus, with the promise of gifts if he complied, and threats of punishment if he refused, he did not go. Alexander, he said, was not the son of Zeus, for he was not so much as master of the larger half of the world. As for himself, he wanted none of the gifts of a man whose desires nothing could satiate: and as for his threats he feared them not: for if he lived India would supply him with food enough, and if he died, he would be delivered from the body of flesh now afflicted with age, and would be translated to a better and a purer life. Alexander expressed admiration of the man, and let him have his own way.

MEGASTHENES FRAGMENT 45

(Lucius Flavius Arrianus, The Indica, 7. 2. 3-9.)

Of Kalanos and Mandanis.

This shows that Alexander, notwithstanding the terrible ascendancy which the passion for glory had acquired over him, was not altogether without a perception of the things that are better: for when he arrived at Taxila and saw the Indian gymnosophists, a desire seized him to have one of these men brought into his presence, because he admired their endurance. The eldest of these sophists, with whom the others lived as disciples with a master, Dandamis by name, not only refused to go himself, but prevented the others going. He is said to have returned this for answer, that he also was the son of Zeus as much as Alexander himself was, and that he wanted nothing that was Alexander's (for he was well off in his present circumstances), whereas he saw those who were with him wandering over so much sea and land for no good got by it, and without any end coming to their many wanderings. He coveted, therefore, nothing Alexander had it in his power to give, nor, on the other hand, feared aught he could do to coerce him: for if he lived, India would suffice for him, vielding him her fruits in due season, and if he died, he would be delivered from his ill-assorted companion the body. Alexander accordingly did not put forth his hand to violence, knowing the man to be of an independent spirit. He is said, however, to have won over Kalanos, one of the sophists of that place, whom Megasthenes represents as a man utterly wanting in self-control, while the sophists themselves spoke opprobriously of Kalanos, because that, having left the happiness enjoyed among them, he went to serve another master than God

INDIKA BOOK 4.

MEGASTHENES FRAGMENT 46

That the Indians had never been attacked by others, nor had themselves attacked others. (Strabo 15. 1 6-8, pp. 686-688.)

But what just reliance can we place on the accounts of India from such expeditions as those of Kyros and Semiramis? If Megasthenes concurs in this view, and recommends his readers to put no faith in the ancient history of India. Its people, he says, never sent an expedition abroad, nor was their country ever invaded and conquered except by Herakles and Dionysos in old times, and by the Makedonians in our own. Yet Sesostris the Egyptian and Tearkon the Ethiopian advanced as far as Europe. And Nabukodrosor, who is more renowned among the Chaldaeans [Babylonians] than even Herakles among the Greeks, carried his arms to the Pillars, which Tearkon also reached, while Sesostris penetrated from Iberia even into Thrace and Pontos. Besides these there was Idanthyrsos the Skythian, who overran Asia as far as Egypt. But not one of these great conquerors approached India, and Semiramis, who meditated its conquest, died before the necessary preparations were undertaken. The Persians indeed summoned the Hydrakai from India to serve as mercenaries, but, they did not lead an army into the country, and only approached its borders when Kyros marched against the Massagetai.

Of Dionysos and Herakles

The accounts about Herakles and Dionysos, Megasthenes and some few authors with him consider entitled to credit, [but the majority, among whom is Eratosthenes, consider them incredible and fabulous, like the stories current among the Greeks.]

On such grounds they called a particular race of people Nyssaians, and their city Nyssa, which Dionysos had founded, and the mountain which rose above the city Meron, assigning as their reason for bestowing these names that ivy grows there, and also the vine, although its fruit does not come to perfection, as the clusters, on account of the heaviness of the rains, fall off the trees before ripening. They further called the Oxydrakai descendants of Dionysos, because the vine grew in their country, and their processions were conducted with great pomp, and their kings on going forth to war and on other occasions marched in Bacchic fashion, with drums beating, while they were dressed in gay coloured robes, which is also a custom among other Indians. Again, when Alexander had captured at the first assault the rock called Aornos, the base of which is washed by the Indus near its source, his followers, magnifying the affair, affirmed that Herakles had thrice assaulted the same rock and had been thrice repulsed. They said also that the Sibae were descended from those who accompanied Herakles on his expedition, and that they preserved badges of their descent, for they wore skins like Herakles, and carried clubs, and branded the mark of a cudgel on their oxen and mules. In support of this story they turn to account the legends regarding Kaukasos and Prometheus by transferring them hither from Pontos, which they did on the slight pretext that they had seen a sacred cave among the Paropamisadae. This they declared was the prison of Promestheus, whither Herakles had come to effect his deliverance, and that this was the Kaukasos, to which the Greeks represent Prometheus as having been bound.

MEGASTHENES FRAGMENT 47

(Lucius Flavius Arrianus, The Indica, V. 4-12.) (See the translation of Arrian's Indika.)

MEGASTHENES FRAGMENT 48.a

Of Nabuchodrosor. (Titus Flavius Josephus Contra Apion. 1. 20; vol. 2 p.451, Havere.)

Megasthenes also expresses the same opinion in the fourth book of his Indika, where he endeavours to show that the aforesaid king of the Babylonians (Nabouchodonosor) surpassed Herakles in courage and the greatness of his achievements, by telling us that he conquered even Iberia.

MEGASTHENES FRAGMENT 48.b

(Titus Flavius Josephus, Jewish Antiquities 10. 2. 1; vol. 1 p.533, Havere.)

[In this place (Nabouchodonosor) erected also of stone elevated places for walking about on, which had to the eye the appearance of mountains, and were so contrived that they were planted with all sorts of trees, because his wife, who had been bred up in the land of Media, wished her surroundings to be like those of her early home.] Megasthenes also, in the fourth book of his Indika, makes mention of these things, and thereby endeavours to show that this king surpassed Herakles in courage and the greatness of his achievements, for he says that he conquered Libya and a great part of Iberia.

MEGASTHENES FRAGMENT 48.c

(Zonar. ed. Basil. 1557, vol. 1. p. 87.)

Among the many old historians who mention Nabouchodonosor, Flavius Josephus enumerates Berosos, Megasthenes, and Diokles.

MEGASTHENES FRAGMENT 48.d

(George Syncellus vol. 1. p.419, ed. Benn.; p.221 ed. Paris, p. 177 ed. Venet.)

Megasthenes, in his fourth book of the Indika represents Nabouchodonosor as mightier than Herakles, because with great courage and enterprise he conquered the greater part of Libya and Iberia.

MEGASTHENES FRAGMENT 49

Of Nabouchodrosor. (Abyden. ap. Euseb. Praep. Ev. 1. 41; ed. Colon. 1688, p. 456 D)

Megasthenes says that Nabouchodrosor, who was mightier than Herakles, undertook an expedition against Libya and Iberia, and that having conquered them he planted a colony of these people in the parts lying to the right of Pontos.

MEGASTHENES FRAGMENT 50.a

(Lucius Flavius Arrianus, The Indica, 7-9.) (See the translation of Arrian's Indica.)

MEGASTHENES FRAGMENT 50.b

Of Pearls. (Pliny the Elder, Natural History, 9.5) Some writers allege that in swarms of oysters, as among bees, individuals distinguished for size and beauty act as leaders. These are of wonderful cunning in preventing themselves being caught, and are eagerly sought for by the divers. Should they be caught, the others are easily enclosed in the nets as they go wandering about. They are then put into earthen pots, where they are buried deep in salt. By this process the flesh is all eaten away, and the hard concretions, which are the pearls, drop down to the bottom.

MEGASTHENES FRAGMENT 50.c

Of the Pandaian Land. (Phlegon. Mirab. 33.) Megasthenes says that the women of the Pandaian realm bear children when they are six years of age.

MEGASTHENES FRAGMENT 51

(Pliny the Elder, Natural History, 6. 21. 4-5.) Of the Ancient History of the Indians.

For the Indians stand almost alone among the nations in never having migrated from their own country. From the days of Father Bacchus to Alexander the Great, their kings are reckoned at 154, whose reigns extend over 6451 years and 3 months. [Solin. 52. 5. Father Bacchus was the first who invaded India, and was the first of all who triumphed over the vanquished Indians. From him to Alexander the Great 6451 years are reckoned with 3 months additional, the calculation being made by counting the, kings who reigned in the intermediate period, to the number of 153.]

INDIKA DOUBTFUL FRAGMENTS.

MEGASTHENES FRAGMENT 52

Of Elephants. (Aelian, Hist. Anim. 12. 8.)

The elephant when feeding at large ordinarily drinks water. but when undergoing the fatigues of war is allowed wine,-not that sort, however, which comes from the grape, but another which is prepared from rice. The attendants even go in advance of their elephants and gather them flowers; for they are very fond of sweet perfumes, and they are accordingly taken out to the meadows, there to be trained under the influence of the sweetest fragrance. The animal selects the flowers according to their smell, and throws them as they are gathered into a basket which is held out by the trainer. This being filled, and harvest-work, so to speak, completed, he then bathes, and enjoys his bath with all the zest of a consummate voluptuary. On returning from bathing he is impatient to have his flowers, and if there is delay in bringing them he begins roaring, and will not taste a morsel of food till all the flowers he gathered are placed before him. This done, he takes the flowers out of the basket with his trunk and scatters them over the edge of his manger, and makes by this device their fine scent be, as it were, a relish to his food. He strews also a good quantity of them as litter over his stall, for he loves to have his sleep made sweet and pleasant.

The Indian elephants were nine cubits in height and five in breadth. The largest elephants in all the land were those called the Praisian, and next to these the Taxilan.

MEGASTHENES FRAGMENT 53

Of a White Elephant. (Aelian, Hist. Anim. 3. 46.) An Indian elephant-trainer fell in with a white elephant-calf. which he brought when still quite young to his home, where he reared it, and gradually made it quite tame and rode upon it. He became much attached to the creature, which loved him in return, and by its affection requited him for its maintenance. Now the king of the Indians, having heard of this elephant, wanted to take it; but the owner, jealous of the love it had for him, and grieving much, no doubt, to think that another should become its master, refused to give it away, and made off at once to the desert mounted on his favourite. The king was enraged at this, and sent men in pursuit, with orders to seize the elephant, and at the same time to bring back the Indian for punishment. Overtaking the fugitive they attempted to execute their purpose, but he resisted and attacked his assailants from the back of the elephant, which in the affray fought on the side of its injured master. Such was the state of matters at the first, but afterwards, when the Indian on being wounded slipped down to the ground, the elephant, true to his salt, bestrides him as soldiers in battle

bestride a fallen comrade, whom they cover with their shields, kills many of the assailants, and puts the rest to flight. Then twining his trunk around his rearer he lifted him on to his back, and carried him home to the stall, and remained with him like a faithful friend with his friend, and showed him every kind attention. [0 men! how base are ye! ever dancing merrily when ye hear the music of the frying-pan, ever revelling in the banquet, but traitors in the hour of danger, and vainly and for nought sullying the sacred name of friendship.]

MEGASTHENES FRAGMENT 54

(Pseudo-Orign, Philosoph. 24, ed. Delarue, Paris, 1733, vol. I. p. 904.)

Of the Brahmans and their Philosophy / Of the Brachhmans in India.

There is among the Brachhmans in India a sect of philosophers who adopt an independent life, and abstain from animal food and all victuals cooked by fire, being content to subsist upon fruits, which they do not so much as gather from the trees, but pick up when they have dropped to the ground, and their drink is the water of the river Tagabena. Throughout life they go about naked, saying that the body has been given by the Deity as a covering for the soul. They hold that God is light, but not such light as we see with the eye, nor such as the sun or fire, but God is with them the Word,--by which term they do not mean articulate speech, but the discourse of reason, whereby the hidden mysteries of knowledge are discerned by the wise. This light, however, which they call the Word, and think to be God, is, they say, known only by the Brachhmans themselves, because they alone have discarded vanity, which is the outermost covering of the soul. The members of this sect regard death with contemptuous indifference, and, as we have seen already, they always pronounce the name of the Deity with a tone of peculiar reverence, and adore him with hymns. They neither have wives nor beget children. Persons who desire to lead a life like theirs cross over from the other side of the river, and remain with them for good, never returning to their own country. These also are called Brachhmans, although they do not follow the same mode of life, for there are women in the country, from whom the native inhabitants are sprung, and of these women they beget offspring. With regard to the Word, which they call God, they hold that it is corporeal, and that it wears the body as its external covering, just as one wears the woollen surcoat, and that when it divests itself of the body with which it is enwrapped it becomes manifest to the eye. There is war, the Brachhmans hold, in the body where with they are clothed, and they regard the body as being the fruitful source of wars, and, as we have already shown, fight against it like soldiers in battle contending against the enemy. They maintain, moreover, that all men are held in bondage, like prisoners of war, to their own innate enemies, the sensual appetites, gluttony, anger, joy, grief, longing desire, and such like while it is only the man who has triumphed over these enemies who goes to God. Dandamis accordingly, to whom Alexander the Makedonian paid a visit, is spoken of by the Brachhmans as a god because he conquered in the warfare against the body, and on the other hand they condemn Kalanos as one who had impiously apostatized from their philosophy. The Brachhmans, therefore, when the have shuffled off the body, see the pure sunlight as fish see it, when they spring up out of the water into the air.

MEGASTHENES FRAGMENT 55.a

Of Kalanos and Mandanis. (Pallad. de Bragmanibus, pp. 8, 20 et seq. ed. Londin. 1668.) (Camerar. libell. gnomolog. pp., 116, 124 et seq.)

They (the Bragmanes) subsist upon such fruits as they can find, and on wild herbs, which the earth spontaneously produces, and dirik only water. They wander about in the woods, and sleep at night on pallets of the leaves of trees.....

"Kalanos, then, your false friend, held this opinion, but be is despised and trodden upon by us. By you, however, accomplice as he was in causing many evils to you all, he is honoured and worshipped, while from our society he has been contemptuously cast out as unprofitable. And why not? when everything which we trample under foot is an object of admiration to the lucre-loving Kalanos, your worthless friend, but no friend of ours, a

miserable creature, and more to be pitied than the unhappiest wretch, for by setting his heart on lucre he wrought the perdition of his soul! Hence he seemed neither worthy of us, nor worthy of the friendship of God, and hence he neither was content to revel away life in the woods beyond all reach of care, nor was be cheered with the hope of a blessed hereafter: for by his love of money he slew the very life of his miserable soul.

"We have, however, amongst us a sage called Dandamis whose home is in the woods, where he lies on a pallet of leaves, and where he has nigh at hand the fountain of peace, whereof he drinks, sucking, as it were, the pure breast of a mother. King Alexander, accordingly, when he heard of all this, was desirous of learning the doctrines of the sect, and so he sent for this Dandaamis, as being their teacher and president.

"Onesikrates was therefore despatched to fetch him, and when he found the great sage he said, "Hail to thee, thou teacher of the Bragmanes. The son of the mighty god Zeus, king Alexander, who is the sovereign lord of all men, asks you to go to him, and if you comply, he will reward you with great and splendid gifts, but if you refuse will cut off your head."

Dandamis, with a complacent smile, heard him to the end, but did not so much as lift up his head from his couch of leaves, and while still retaining his recumbent attitude returned this scornful answer:--"God, the supreme king, is never the author of insolent wrong, but is the creator of light, of peace, of life, of water, of the body of man, and of souls, and these he receives when death sets them free, being in no way subject to evil desire. He alone is the god of my homage, who abhors slaughter and instigates no wars. But Alexander is not God, since he must taste of death; and how can such as he be the world's master, who has not yet reached the further shore of the river Tiberoboas, and has not yet seated himself on a throne of universal dominion? Moreover, Alexander has neither as yet entered living into Hades, nor does he know the course of the sun through the central regions of the earth, while the nations on its boundaries have not so much as heard his, name. If his present dominions are not capacious enough for his desire, let him cross the Ganges river, and he will find a region able to sustain men if the country on our side be too narrow to hold him. Know this, however, that what Alexander offers me, and the gifts he promises, are all things to me utterly useless; but the things which I prize, and find of real use and worth, are these leaves which are my house, these blooming plants which supply me with dainty food and the water which is my drink, while all other possessions and things, which are amassed with anxious care, are wont to prove ruinous to those who amass them, and cause onlysorrow and vexation, with which every poor mortal is fully fraught. But as for me, I lie upon the forest leaves, and, having nothing which requires guarding, close my eyes in tranquil slumber; whereas had I gold to guard, that would banish sleep. The earth supplies me with everything, even as a mother her child with milk. I go wherever I please, and there are no cares with which I am forced to cumber myself, against my will. Should Alexander cut off my head, he cannot also destroy my soul. My head alone, now silent, will remain, but the soul will go away to its Master, leaving the body like a torn garment upon the earth, whence also it was taken. I then, becoming spirit shall ascend to my God who enclosed us in flesh, and left us upon the earth to prove whether when here below we shall live obedient to his ordinances, and who also will require of us, when we depart hence to his presence, an account of our life, since he is judge of all proud wrong-doing; for the groans of the oppressed become the punishments of the oppressors.

Let Alexander, then, terrify with these threats those who wish for gold and for wealth, and who dread death, for against as these weapons are both alike powerless, since the Bragmanes neither love gold nor fear death. Go, then, and tell Alexander this: Dandamis has no need of aught that is yours, and therefore will not go to you, but if you want anything from Dandamis come you to him."

Alexander, on receiving from Onesikrates a report of the interview, felt a stronger desire than ever to see Dandamis, who, though old and naked, was the only antagonist in whom he, the conqueror of many nations, had found more than his match.

MEGASTHENES FRAGMENT 55.b

Ambrosius, De Moribus Brachmanorum, pp. 62, 68 et seq. ed. Pallad. Londinium 1668.

Of Calanus and Mandanis.

They (the Brachmans) eat what they find on the ground, such as leaves, of trees and wild herbs, like cattle.

Calanus is your friend, but he is despised and trodden upon by us. He, then, who was the author of many evils among you, is honoured and worshipped by you; but since he is of no importance he is rejected by us, and those things we certainly do not seek, please Calanus because of his greediness for money. But he was not ours, a man such as has miserably injured and lost his soul, on which account he is plainly unworthy to be a friend either of God or of ours nor has he deserved security among the woods in this world, nor can he hope for the glory which is promised in the future.

When the emperor Alexander came to the forests, he was not able to see Dandamis as he passed through.

When, therefore, the above-mentioned messenger came to Dandamis, he addressed him thus:-- "The emperor Alexander, the son of the great Jupiter, who is lord of the human race, has ordered, that you should hasten to him, for if you come, he will give you many gifts, but if you refuse he will behead you as a punishment for your contempt."

When these words came to the ears of Dandamis, he rose not from his leaves whereon he lay, but reclining and smiling he replied in this way:--"The greatest God," he said, "can do injury to no one, but restores again the light of life to those who have departed. Accordingly he alone is my lord who forbids murder and excites no wars. But Alexander is no God, for he himself will have to die. How, then, can he be the lord of all, who has not yet crossed the river Tyberoboas, nor has made the whole world his abode, nor crossed the zone of Gades, nor has beheld the course of the sun in the centre of the world? Therefore many nations do not yet even know his name. If, however, the country he possesses cannot contain him, let him cross our river and he will find a soil which is able to support men. All those things Alexander promises would be useless to me if he gave them: I have leaves for a house, live on the herbs at hand and water to drink; other things collected with labour, and which perish and yield nothing but sorrow to those seeking them or possessing them. these I despise. I therefore now rest secure, and with closed eyes I care for nothing. If I wish to keep gold, I destroy my sleep; Earth supplies me with everything, as a mother does to her child. Wherever I wish to go, I proceed wherever I do not wish to be, no necessity of care can force me to go. And if he wish to cut off my head, he cannot take my soul; he will only take the fallen head, but the departing soul will leave the head like a portion of some garment, and will restore it to whence it received it, namely, to the earth. But when I shall have become a spirit I shall ascend to God, who has enclosed it within this flesh. When he did this he wished to try us, how, after leaving him, we would live in this world. And afterwards, when we shall have returned to him, he will demand from us an account of this life. Standing by him I shall see my injury, and shall contemplate his judgement on those who injured me: for the sighs and groans of the injured become the punishments of the oppressors. Let Alexander threaten with this them that desire riches or fear death, both of which I despise. For Brachmans neither love gold nor dread death. Go, therefore, and tell Alexander this:-- Dandamis seeks nothing of yours, but if you think you need something of his, disdain not to go to him.

When Alexander heard these words through the interpreter, he wished the more to see such a man, since he, who had subdued many nations, was overcome by an old naked man.

MEGASTHENES FRAGMENT 56.a

List of the Indian Races. (Pliny the Elder, Natural History,. 6. 21. 8-23. 11.)

The other journeys made thence (from the Hyphasis) for Seleukos Nikator are as follows:--168 miles to the Hesidrus, and to the river Jomanes as many (some copies add 5 miles); from thence to the Ganges 112 miles, 9 miles to Rhodopha (others give 325 miles for this distance).

To the town Kalinipaxa 167-500. Others give 263 miles. Thence to the confluence of the Jamanes and Ganges 625 miles (many add 13 miles), and to the town Palimbothra 425. To the mouth of the Ganges 738 miles.

The races which we may enumerate without being tedious, from the chain of Emodus, of which a spur is called Imaus (meaning in the native tongue snowy), are the Isari, Cosyri, Izgi, and on the hills the Chisiotosagi, and the Brachmauae, a name comprising many tribes, among which are the Maccocalingae. The river Prinas and the Cainas (which flows into the Ganges) are both navigable. The tribes called Calingae are nearest the sea, and higher up are the Mandei, and the Malli in whose, country is Mount Mallus, the boundary of all that district being the Ganges.

This river, according to some, rises from uncertain sources, like the Nile, and inundates similarly the countries lying along its course; others say that it rises on the Skythian mountains, and has nineteen tributaries, of which, besides those already mentioned, the Condochates, Erannoboas, Cosoagus, and Sonus are navigable. Others again assert that it issues forth at once with loud roar from its fountain, and after tumbling down a steep and rocky channel is received immediately on reaching the level plains into a lake, whence it flows out with a gentle current, being at the narrowest eight miles, and on the average a hundred stadia in breadth, and never of less depth than twenty paces (one hundred feet) in the final part of its course, which is through the country of the Gangarides. The royal city of the Calingae is called Parthalis. Over their king 60,000 foot-soldiers, 1,000 horsemen, 700 elephants keep watch and ward in "procinct of war."

For among the more civilized Indian communities life is spent in a great variety of separate occupations. Some till the soil, some are soldiers, some traders; the noblest and richest take part in the direction of state affairs, administer justice, and sit in council with the kings. A fifth class devotes itself to the philosophy prevalent in the country, which almost assumes the form of a religion, and the members always put an end to their life by a voluntary death on a burning funeral pile. In addition to these classes there is one half-wild, which is constantly engaged in a task of immense labour, beyond the power of words to describe--that of hunting and taming elephants. They employ these animals in ploughing and for riding on, and regard them as forming the main part of their stock in cattle. They employ them in war and in fighting for their country. In choosing them for war, regard is had to their age, strength, and size.

There is a very large island in the Ganges which is inhabited by a single tribe Modogalingae. Beyond are situated the Modubae, Molindae, the Uberae with a handsome town of the same name, the Galmodroesi, Preti, Calissae, Sasuri, Passalae, Colubae, Orxulae, Abali, Taluctae. The king of these keeps under arms 50,000 foot-soldiers, 4,000 cavalry, and 400 elephants. Next come the Andarae, a still more powerful race, which possesses numerous villages, and thirty towns defended by walls and towers, and which supplies its king with an army of 100,000 infantry, 2,000 cavalry, and 1,000 elephants. Gold is very abundant among the Dardae, and silver among the Setae.

But the Prasii surpass in power and glory every other people, not only in this quarter, but one may say in all India, their capital Palibothra, a very large and wealthy city, after which some call the people itself the Palibothri,--nay even the whole tract along the Ganges. Their king has in his pay a standing army of 600,000 foot-soldiers, 30,000 cavalry, and 9,000 elephants: whence may be formed some conjecture as to the vastness of his resources.

After these, but more inland, are the Monedes and Suari, in whose country is Mount Maleus, on which shadows fall towards the north in winter, and towards the south in summer, for six months alternately. Baeton asserts that the north pole in these parts is seen but once in the year, and only for fifteen days; while Megasthenes says that the same thing happens in many parts of India. The south pole is called by the Indians Dramasa. The river Jomanes flows through the Palibothri into the Ganges between the towns Methora and Carisobora. In the parts which lie southward from the Ganges the inhabitants, already swarthy, are deeply coloured by the sun, though not scorched black like the Ethiopians. The nearer they approach the Indus the more plainly does their complexion betray the influence of the sun.

The Indus skirts the frontiers of the Prasii, whose mountain tracts are said to be inhabited by the Pygmies. Artemidorus sets down the distance between the two rivers at 121 miles.

The Indus, called by the inhabitants Sindus, rising on that spur of Mount Caucasus which is called Paropamisus, from sources fronting the sunrise, receives also itself nineteen rivers. of which the most famous are the Hydaspes, which has four tributaries; the Cantabra, which has three; the Acesines and the Hypasis, which are both navigable; but nevertheless, having no very great supply of water, it is nowhere broader than fifty stadia, or deeper than fifteen paces. It forms an extremely large island which is called Prasiane and a smaller one, called Patale. Its stream, which is navigable, by the lowest estimates, for 1,240 miles, turns westward as if following more or less closely the course of the sun, and then falls into the ocean. The measure of the coast line from the mouth of the Ganges to this river I shall set down as it is generally given, though none of the computations agree with each other. From the mouth of the Ganges to Cape Calingon and the town of Dandagula 625 miles; to Tropina 1,225; to the cape of Perimula, where there is the greatest emporium of trade in India, 750 miles; to the town in the island of Patala mentioned above, 620 miles.

The hill-tribes between the Indus and the Iomanes are the Cesi; the Cetriboni, who live in the woods; then the Megallae, whose king is master of five hundred elephants and an army of horse and foot of unknown strength; the Chrysei, the Parasangae, and the Asange, where tigers abound, noted for their ferocity. The force under arms consists of 30,000 foot, 300 elephants, and 800 horse. These are shut in by the Indus, and are surrounded by a circle of mountains and deserts over a space, of 625 miles. Below the deserts are the Dari, the Surae, then deserts again for 187 miles, these deserts encircling the fertile tracts just as the sea encircles islands. Below these deserts we find the Maltecorae, Singhae, Marohae, Rarungae, Moruni. These inhabit the hills which in an unbroken chain run parallel to the shores of the ocean. They are free and have no kings, and occupy the mountain heights, whereon they have built many cities. Next follow the Narae, enclosed by the loftiest of Indian mountains, Capitalia, The inhabitants on the other side of this mountain work extensive mines of gold and silver. Next are the Oraturae, whose king has only ten elephants, though he has a very strong force of infantry. Next again are the Varetatae, subject to a king, who keep no elephants, but trust entirely to their horse and foot. Then the Odomoboerae: the Salabastrae: the Horatae, who have a fine city, defended by marshes which serve as a ditch, wherein crocodiles are kept, which, having a great avidity for human flesh, prevent all access to the city except by a bridge. And another city of theirs is much admired--Automela, which, being seated on the coast at the confluence of five rivers, is a noble emporium of trade. The king is master of 1,600 elephants, 150,000 foot, and 5,000 cavalry. The poorer king of the Charmae has but sixty elephants, and his force otherwise is insignificant. Next come the Pandae, the only race in India ruled by women. They say that Hercules having but one daughter, who was on that account all the more beloved, endowed her with a noble kingdom. Her descendants

rule over 300 cities, and command an army of 150,000 foot and 500 elephants. Next, with 300 cities, the Syrieni, Derangae, Posingae, Buzae, Gogiarei, Umbrae, Nereae, Brancosi, Nobundae, Cocondae, Nesei, Pedatrirae, Solobriasae, Olostrae, who adjoin the island Patale, from the furthest shore of which to the Caspian gates the distance is said to be 1,925 miles.

Then next to these towards the Indus come, in an order which is easy to follow, the Amatae, Bolingae, Gallitalutae, Dimuri, Megari, Ordabae, Mese; after these the Uri and Sileni. Immediately beyond come deserts extending for 250 miles. These being passed, we come to the Organagae, Abaortae, Sibarae, Suertae, and after these to deserts as extensive as the former. Then come the Sarophages, Sorgae, Baraomatae, and the Umbrittae, who consist of twelve tribes, each possessing two cities, and the Aseni, who possess three cities. Their capital is Bucephala, built where Alexander's famous horse of that name was buried. Hillmen follow next, inhabiting the base of Caucasus, the Soleadae, and the Sondrae; and if we cross to the other side of the Indus and follow its course downward we meet the Samarabriae, Sambruceni, Bisambritae, Osii, Antixeni, and the Taxillae with a famous city. Then succeeds a level tract of country known by the general name of Amanda, whereof the tribes are four in number the Peucolaitae, Arsagalitae, Geretae, Asoi.

Many writers, however, do not give the river Indus as the western boundary of India, but include within it four satrapies,--the Gedrosi, Arachotae, Arii, Paropamisadae, making the river Cophes its furthest limit; though others prefer to consider all these as belonging to the Arii.

Many writers further include in India even the city Nysa and Mount Merus, sacred to Father Bacchus, whence the origin of the fable that he sprang from the thigh of Jupiter. They include also the Astacani, in whose country the vine grows abundantly, and the laurel, and boxwood, and every kind of fruit-tree found in Greece. The remarkable and almost fabulous accounts which are current regarding the fertility of its soil, and the nature of its fruits and trees, its beasts and birds and other animals, will be set down each in its own place in other parts of this work. A little further on I shall speak of the satrapies, but the island of Taprobane requires my immediate attention.

But before we come to this island there are others, one being Patale, which, as we have indicated, lies at the mouth of the Indus, triangular in shape, and 220 miles in breadth. Beyond the mouth of the Indus are Chryse and Argyre, rich, as I believe, in metals. For I cannot readily believe, what is asserted by some writers, that their soil is impregnated with gold and silver. At a distance of twenty miles from these lies Crocala, from which, at a distance of twelve miles, is Bigaba, which abounds with oysters and other shell-fish. Next comes Toralliba, nine miles distant from the last-named island, beside many others unworthy of note.

MEGASTHENES FRAGMENT 56.b.

Catalogue of Indian Races. (Solin. 52. 6-17.)

The greatest rivers of India are the Ganges and Indus, and of these some assert that the Ganges rises from uncertain sources and inundates the country in the manner of the Nile, while others incline to think that it rises in the Scythian mountains. [The Hypanisis is also there, a very noble river, which formed the limit of Alexander's march, as the altars erected on its banks prove.] The least breadth of the Ganges is eight miles, and its greatest twenty. Its depth where it is shallowest is fully a hundred feet. The people who live in the furthest-off part are the Gangarides, whose king possesses 1,000 horse, 700 elephants, and 60,000 foot in apparatus of war.

Of the Indians some cultivate the soil, very many follow war, and others trade. The noblest and richest manage public affairs, administer justice, and sit in council with the kings. There exists also a fifth class, consisting of those most eminent for their wisdom, who, when sated with life, seek death by mounting a burning funeral pile. Those, however, who have become the devotees of a sterner sect, and pass their life in the woods, hunt elephants, which, when made quite tame and docile, they use for ploughing and for riding on.

In the Ganges there is an island extremely populous, occupied by a very powerful nation whose king keeps under arms 50,000 foot and 4,000 horse. In fact no one invested with kingly power ever keeps on foot a military force without a very great number of elephants and foot and cavalry.

The Prasian nation, which is extremely powerful, inhabits a city called Palibotra, whence some call the nation itself the Palibotri. Their king keeps in his pay at all times 60,000 foot, 30,000 horse, and 8,000 elephants.

Beyond Palibotra is Mount Maleus, on which shadows in winter fall towards the north, in summer towards the south, for six months alternately. In that region the Bears are seen but once a year, and not for more than fifteen days, as Beton informs us, who allows that this happens in many parts of India. Those living near the river Indus in the regions that turn southward are scorched more than others by the heat, and at last the complexion of the people is visibly affected by the great power of the sun. The mountains are inhabited by the Pygmies.

But those who live near the sea have no kings.. The Pandaean nation is governed by females, and their first queen is said to have been the daughter of Hercules. The city Nysa is assigned to this region, as is also the mountain sacred to Jupiter, Meros by name, in a cave on which the ancient Indians affirm Father Bacchus was nourished; while the name has given rise to the well known fantastic story that Bacchus was born from the thigh of his father. Beyond the mouth of the Indus are two islands, Chryse and Argyre, which yield such an abundant supply of metals that many writers allege their soils consist of gold and of silver.

MEGASTHENES FRAGMENT 57

Of Dionysos. (Polyaen. Strateg. 1. 1. 1-3.)

Dionysos, in his expedition against the Indians, in order that the cities might receive him willingly, disguised the arms with which he had equipped his troops, and made them wear soft raiment and fawn-skins. The spears were wrapped round with ivy, and the thyrsus had a sharp point. He gave the signal for battle by cymbals and drums instead of the trumpet, and by regaling the enemy with wine diverted their thoughts from war to dancing. These and all other Bacchic orgies were employed in the system of warfare by which he subjugated the Indians and all the rest of Asia.

Dionysos, in the course of his Indian campaign, seeing that his army could not endure the fiery heat of the air, took forcible possession of the three-peaked mountain of India. Of these peaks, one is called Korasibie, another Kondaske, but to the third he himself gave the name of Meros, in remembrance of his birth. Thereon were many fountains of water sweet to drink, game in great plenty, tree-fruits in unsparing profusion, and snows which gave new vigour to the frame. The troops quartered there made a sudden descent upon the barbarians of the plain, whom they easily routed, since they attacked them with missiles from a commanding position on the heights above.

[Dionysos, after conquering the Indians, invaded Baktria, taking with him as auxiliaries the Indians and Amazons. That country has for its boundary the river Saranges. The Baktrians seized the mountains overhanging that river with a view to attack Dionysos, in crossing it from a post of advantage. He, however, having encamped along the river, ordered the Amazons and the Bakkhai to cross it, in order that the

Baktrians, in their contempt for women, might be induced to come down from the heights. The women then assayed to cross the stream, and the enemy came downhill, and advancing to the river endeavoured to beat them back. The women then retreated, and the Baktrians pursued them as far as the bank; then Dionysos, coming to the rescue with his men, slew the Baktrians, who were impeded from fighting by the current, and he crossed the river in safety.

MEGASTHENES FRAGMENT 58

Of Hercules and Pandaea. (Polyaen. Strateg. 1. 3. 4.) Herakles begat a daughter in India whom he called Pandaia. To her he assigned that portion of India which lies to southward and extends to the sea, while he distributed the people subject to her rule into 365 villages, giving orders that one village should each day bring to the treasury the royal tribute, so that the queen might always have the assistance of those men whose turn it was to pay the tribute in coercing those who for the time being were defaulters in their payments.

MEGASTHENES FRAGMENT 59

Of the Beasts of India. (Aelian, Hist. Anim. XVI. 2-22.)

In India I learn that there are to be found the birds called parrots; and though I have no doubt, already mentioned them, yet what I omitted to state previously regarding them may now with great propriety be here set down. There are, I am informed, three species of them, and all these, if taught to speak, as children are taught, become as talkative as children, and speak with human voice; but in the woods they utter a bird-like scream, and neither send out any distinct and musical notes, nor being wild and untaught are able to talk. There are also peacocks in India, the largest anywhere met with, and pale-green ringdoves. One who is not well-versed in bird-lore seeing these for the first time, would take them to be parrots, and not pigeons. In the colour of the bill and legs they resemble Greek partridges. There are also cocks, which are of extraordinary size, and have their crests not red as elsewhere, or at least in our country, but have the flower-like coronals of which the crest is formed variously coloured. Their rump feathers, again, are neither curved nor wreathed, but are of great breadth, and they trail them in the way peacocks trail their tails, when they neither straighten nor erect them: the feathers of these Indian cocks are in colour golden, and also dark-blue like the smaragdus.

There is found in India also another remarkable bird. This is of the size of a starling and is parti-coloured, and is trained to utter the sounds of human speech. It is even more talkative than the parrot, and of greater natural cleverness. So far is it from submitting with pleasure to be fed by man, that it rather has such a pining for freedom, and such a longing to warble at will in the society of its mates, that it prefers starvation to slavery with sumptuous fare. It is called by the Makedonians who settled among the Indians in the city of Boukephala and its neighbourhood, and in the city called Kuropolis, and others which Alexander the son of Philip built, the Kerkion. This name had, I believe, its origin in the fact that the bird wass its tail in the same way as the water-ousels.

I learn further that in India there is a bird called the Kelas, which is thrice the size of the bustard, and has a bill of prodigious size and long legs. It is furnished also with an immense crop resembling a leather pouch. The cry which it utters is peculiarly discordant. The plumage is ash-coloured, except that the feathers at their tips are tinted with a pale yellow.

I bear also that the Indian hoopoe is double the size of ours, and more beautiful in appearance, and Homer says that while the bridle and trappings of a horse are the delight of a Hellenic king, this hoopoe is the favourite plaything of the king of the Indians, who carries it on his hand, and toys with it, and never tires gazing in ecstasy on its splendour, and the beauty with which Nature has adorned it. The, Brachmanes, therefore, even make this particular bird the subject of a mythic story, and the tale told of it runs thus: -- To the king of the Indians there was born a son. The child had elder brothers, who when they came to man's estate turned out to be very unjust and the greatest of reprobates. They despised their brother because he was the youngest; and they scoffed also at their father and their mother, whom they despised because they were very old and grey-haired. The boy, accordingly, and his aged parents could at last no longer live with these wicked men, and away they fled from home, all three together. In the course of the protracted journey which they had then to undergo, the old people succumbed to fatigue and died, and the boy showed them no light regard, but buried them in himself, having cut off his head with a sword. Then, as the Brachmanes tell us, the all-seeing sun, in admiration of this surpassing act of piety, transformed the boy into a bird which is most beautiful to behold, and which lives to a very advanced age. So on his head there grew up a crest which was, as it were, a memorial of what he had done at the time of his flight. The Athenians have also related, in a fable, marvels somewhat similar of the crested lark; and this fable Aristophanes, the comic poet, appears to me to have followed when he says in the Birds, "For thou wert ignorant, and not always bustling, nor always thumbing Aesop, who spake of the crested lark, calling it the first of all birds, born before ever the earth was; and telling how afterwards her father became sick and died, and how that, as the earth did not then exist, he lay unburied till the fifth day, when his daughter, unable to find a grave elsewhere, dug one for him in her own head.'

It seems, accordingly, probable that the fable, though with a different bird for its subject, emanated from the Indians, and spread onward even to the Greeks. For the Brachmanes say that a prodigious time has elapsed since the Indian hoopoe, then in human form and young in years, performed that act of piety to its parents.

In India there is an animal closely resembling in appearance the land crocodile, and somewhere about the size of a little Maltese dog. It is covered all over with a scaly skin so rough altogether and compact that when flayed off it is used by the Indians as a file. It cuts through brass and eats iron. They call it the phattages (pangolin or scaly ant-eater).....

The Indian sea breeds sea-snakes which have broad tails, and the lakes breed hydras of immense size, but these seasnakes appear to inflict a bite more sharp than poisonous.

In India there are herds of wild horses, and also of wild asses. They say that the mares submit to be covered by the asses, and enjoy such coition, and breed mules, which are of a reddish colour and very fleet, but impatient of the yoke and otherwise skittish. They say that they catch these mules with foot-traps, and then take them to the king of the Prasians, and that if they are caught when two years old they do not refuse to be broken in, but if caught when beyond that age they differ in or respect from sharp-toothed and carnivorous animals.

NATURALIS HISTORIA / NATURAL HISTORY

By Gaius Plinius Secundus Also known as Plinius Maior or Pliny The Elder Published by Gaius Plinius Caecilius Secundus Also known as Plinius Minor, Pliny the Younger Original Language and Script: Latin Natural History (Rackham, Jones, & Eichholz Natural History (1938) by Pliny the Elder, Translation: H. Rackham (Vols. 1-5, 9), W.H.S. Jones (Vols. 6-8), and D.E. Eichholz (Vol. 10), 1938 Estimated Range of Dating: 70 A.D.

(This is one of the most extraordinary books in history. Its title Naturalis Historia, usually translated into English as Natural History, is totally misleading the modern reader. It suggests that it is just about plants and animals, yet we must not view the Roman title with the eyes of our scientifically trained mind. In reality, this book shows us, like nothing else, why explorers and merchants in Antiquity took all the incalculable risks that a journey of 10,000 or 20,000 miles bears in itself. Yes, this book is about nature, and yes, this book is about plants, animals and geography. But above all, it is the main shopping list of the Roman Empire. It is the written expertise on Roman science, technology and education. This book reveals, like no other, the worldwide trade and the economic outcome in figures and numbers. This book is the main witness of Flavian enlightenment, never renorted in this extent before or after.

The Natural History was compiled and written by Gaius Plinius Secundus or Plinius Maior (AD 23–79), also called Pliny the Elder in English. He was mainly a Roman naval and army commander of the early Roman Empire, although to many he is well-known as author. He spent most of his spare time studying, writing, and investigating natural phenomena, geographic locations, applicable technologies, and he even did not stop before economical, financial and political questions. Plinius was courageous man and he died on 25 August 79 AD when he was attempting the rescue by ship of a friend and his family from the eruption of Mount Vesuvius. The eruption had just destroyed the cities of Pompeii and Herculaneum.

He was a close personal friend of the emperor Vespasian and his son Titus. As a matter of fact, he belonged to a very special group of people we could call "The Literary Circle of the Flavian Dynasty." It was a group designed to re-shape the Roman Empire which the new Emperor Vespasian just had saved from total disaster that was caused by bad management of the last Julio-Claudian administrations and the subsequent war against the Messianic Movement, better known as the First Roman-Jewish War, 66-73 AD. All these people were companions, sharing daily life and professional ambitions. Many were related through friendship, marriage, and teacherstudent companionship. The main driving force was a man we know as Vespasian. His full name was Titus Flavius Vespasianus.

Vespasian can be compared with Han Wudi of China (157– 87 BC; r. 141–87 BC), whose reign launched a vast expansion of geopolitical influence for the Chinese civilisation, the development of a strong centralised state, economical reorganisation and promotion of a hybrid Legalist-Confucian doctrine via governmental policies and propaganda. Vespasian too expanded geopolitical influence for the Roman civilisation, the development of a strong centralised state, economical reorganisation and promotion of a hybrid Stoie-Messianic doctrine via governmental policies and propaganda. He strengthened the Roman Imperial Cult (which was nothing less but a Ministery of Religion with a huge tax-based revenue) by reforming the Babylonian Talmud and very likely by creating Roman Christianity.

To the "The Literary Circle of the Flavian Dynasty" belonged persons like: Titus Flavius Vespasianus (Vespasian, 9-79 AD); Titus Flavius Sabinus (c. 15-69 AD) was soldier, politician, brother and keen supporter of Emperor Vespasian. Gaius Licinius Mucianus (c. 20–77 AD) was a Roman general, statesman and writer who have played a role behind the scenes in the elevation of Vespasian to the throne; Gaius Plinius Secundus or Plinius Maior (Pliny the Elder, 23-79 AD) close friend of Vespasian and Titus; Titus Flavius Sabinus (c. 40-?), son of Vespsian's brother and brother of Titus Flavius Clemens (consul in 95), husband of Julia Flavia, the daughter of his cousin, the future emperor Titus, Flavia Domitilla Minor (c. 45–66) was the only daughter of the Roman Emperor Vespasian and mother of Flavia Domitilla the saint. Titus Flavius Vespasianus (Titus, 39-81 AD); Berenice of Cilicia (Herod Julia Berenice or Bernice, daughter of the Jewish King Herod Agrippa I and a sister of King Herod Agrippa II, 28–82 AD), was a Jewish client queen of the Roman Empire and the lover or wife of Titus from 67 to his death. Titus Flavius Josephus (Yosef bar Matityahu, 37-100 AD); adoptive son of Vespasian; Titus Flavius Domitianus (Domitian, 51–96 AD);

Flavia Domitia Longina (c. 52–126 AD), wife to Titus Flavius Domitianus; Julia Flavia (Julia Titi, daughter of

THE GRAND BIBLE

Titus and Flavia Domitia Longina (8 September 64 – 91): Gaius Plinius Caecilius Secundus or Plinius Minor (Pliny the Younger, c. 61–113 AD); Titus Flavius Sabinus (c. 65–?), grandson of Vespasian's brother, Sabinus' brother was Titus Flavius Clemens, consul in 95; Titus Flavius Clemens (Pope Clement I, c. 35-96 AD); Flavia Domitilla (saint) was his cousin and wife; Flavia Domitilla (saint), daughter of Vespasian's dauther Flavia Domitilla Minor, she married her cousin, the consul Titus Flavius Clemens: the authors of the Gospel of Matthew (probably Yosef bar Matityahu, that is Josephus, 37-100 AD), the Gospel of Mark (may be Marcus Valerius Martialis, c. 38-104 AD or Marcus Fabius Quintilianus, c. 35-100 AD), and the Gospel of Luke (Lucius Mestrius Plutarchus, c. 46-120 AD). Josephus probably knew Saul of Tarsos from the time when he was a priest in the Temple of Jerusalem or when both went to Rome in about 62 or 63 AD. When Josephus came back to Rome after the Roman-Jewish War, he lived in Vespasians Palace, at the northern side of the Circus Maximus, next door to the emperor's quarters and the library where the captured Hebrew books of the destroyed Temple were kept. There is some likelihood that Josephus met here also Plinius Maior from whom he might have got advice for his writing style which is in some ways similarly straight forward as that of Plinius.

Scope and topics of the Naturalis Historia suggest that Plinius wrote it as a commissioned work for the Flavian Literary Circle. The book is so large that it became an editorial model for encyclopaedias. Together with the works of Caesar, Philo and Josephus, the Naturalis Historia is one of the largest works to have survived from the Roman Empire to the modern day in an almost complete condition. It claims to cover the entire field of ancient knowledge, based on the best authorities available to Plinius. He claims to be the only Roman ever to have undertaken such a work. We can imagine that Plinius had an entire staff of scribes employed, so had Josephus. This book describes in astonishing details plants, animals, minerals, gems, metals, and where to find them, what to do with them, what for to use them and even how. More than any other publication, the Naturalis Historia has fostered foreign trade with Africa, India and China.

Plinius combined his scholarly activities with a busy career as an imperial administrator for the emperor Vespasian. Much of his writing was done at night; daytime hours were spent working for the emperor, as he explains in the dedicatory preface addressed to Vespasian's elder son, the future emperor Titus, with whom he had served in the army (and to whom the work is dedicated). As for the nocturnal hours spent writing, these were seen not as a loss of sleep but as an addition to life. It is the only work by Plinius to have survived, and the last that he published. He published the first 10 books in 77 AD, but had not made a final revision of the remainder at the time of his death during the 79 AD eruption of Vesuvius. The rest was published posthumously by Pliny's nephew, Pliny the Younger.

Measuring Roman Economy

What makes Plinius' account so special is the given figures of costs. They may sound exaggerated. However, as member of the Roman government, he had access to state archives and the documents in them. Therefore it sounds unlikely that he was lying. He normally uses the sestertius as currency example. Most modern people have no idea about the average purchasing power of this money unit.

It is difficult to make any comparisons with modern money or prices, but for most of the 1st century AD, a legionary (a highly trained soldier who usually had 2 or 3 additional professions in the past like builder, metal worker, etc.) was paid 900 sestertii per year (circa 75 sestertii per month and 2.5 sestertii per day. Half of it could be deducted for living costs of the soldier; so he might have left 1.25 sestertii per day if he was lucky enough to get paid.)

We may compare that with the estimated income or purchasing power of a staff sergeant in 2018: U.S. staff sergeant \$32,400 year (\$2,700 month / \$90 day); U.K. staff sergeant \$43,000 year (\$3,580 month / \$120 day). Although the figures of the U.S. and the U.K. look different, in the end, they roughly represent an equal purchasing power as food, rent etc. is much cheaper in the U.S.

The 900 sestertii fit into \$32,400 circa $36 \times$ and in £43,000 circa $48 \times$. That is an average fit of $42 \times$ for USD and GBP combined. So, when we multiply a sum of Roman sestertii by only $40 \times$, we might get a rough idea what sum of money Plinius was talking about translated into modern GBP or USD.]

Measuring Distances

The Romans knew very well that the Earth was a ball. Since the times of Eratosthenes (c. 276–194 BC), the Romans also had a pretty good idea about the size of the Earth. The measurement of Earth's circumference is the most famous among the results obtained by Eratosthenes, who estimated that the meridian has a length of 252,000 stadia, with an error on the real value between -2.4% and +0.8% (assuming a value for the stadion between 155 and 160 metres). Eratosthenes described his arc measurement technique, in a book entitled On the measure of the Earth, which has not been preserved.

Some time between Posidonius of Rhodes (c. 135–51 BC) and Claudius Ptolemy (c. 100–170 AD), i.e. between the 1st century BC and the 2nd century AD, a Greek named Cleomedes wrote a book on astronomy, De motu circulari corporum caelestium [H. Ziegler, Libri, Leipzig: Teubner, 1891, updated Teubner by R.B. Todd, 1990.]. This was based mainly on the lost work of Posidonius, but also on others.

Cleomedes (c. 300–370 AD) is our primary source for the calculations of Erastothenes, who measured the earth in the 3rd century BC. Here's the relevant passage, from Heath's translation of Cleomedes, On the orbits of the heavenly bodies, I, 10. [Translated by T. L. Heath in Greek Astronomy, London (1932); via Cohen & Drabkin, A source book in Greek Science, 1948, p.149-153.]:

1. About the size of the earth the physicists, or natural philosophers, have held different views, but those of Posidonius and Eratosthenes are preferable to the rest. The latter shows the size of the earth by a geometrical method; the method of Posidonius is simpler. Both lay down certain hypotheses, and, by successive inferences from the hypotheses, arrive at their demonstrations.

2. Posidonius says that Rhodes and Alexandria lie under the same meridian. Now meridian circles are circles which are drawn through the poles of the universe and through the point which is above the head of any individual standing on the earth. The poles are the same for all these circles, but the vertical point is different for different persons. Hence we can draw an infinite number of meridian circles. Now Rhodes and Alexandria lie under the same meridian circle, and the distance between the cities is reputed to be 5,000 stades. Suppose this to be the case.

3. All the meridian circles are among the great circles in the universe, dividing it into two equal parts and being drawn through the poles. With these hypotheses, Posidonius proceeds to divide the zodiac circle, which is equal to the mendian circles, because it also divides the universe into two equal parts, into forty-eight parts, thereby cutting each of the twelfth parts of it (i.e., signs) into four. If, then, the meridian circle through Rhodes and Alexandria is divided into the same number of parts, forty-eight, as the zodiac circle, the segments of it are equal to the aforesaid segments of the zodiac. For, when equal magnitudes are divided into (the same number of) equal parts, the parts of the divided magnitudes must be respectively equal to the parts. This being so, Posidonius goes on to say that the very bright star called Canopus lies to the south, practically on the Rudder of Argo. The said star is not seen at all in Greece; hence Aratus does not even mention it in his Phaenomena. But, as you go from north to south, it begins to be visible at Rhodes and, when seen on the horizon there, it sets again immediately as the universe revolves. I But when we have sailed the 5 000 stades and are at Alexandria this star, when it is exactly in the middle of the heaven, is found to be at a height above the honzon of one-fourth of a sign, that is, one forty-eighth part of the zodiac circle.' It follows, therefore, that the segment of the same mendian circle which lies above the distance between Rhodes and Alexandria is one forty-eighth part of the said circle, because the honzon of the Rhodians is distant from that of the Alexandrians by one forty-eighth of the zodiac circle. Since, then, the part of the earth under this segment is reputed to be 5,000 stades, the parts (of the earth) under the other (equal) segments (of the meridian circle) also measure 5,000 stades; and thus the great circle of the earth is found to measure 240,000 stades, assuming that from Rhodes to Alexandria is 5.000 stades: but, if not, it is in (the same) ratio to the distance. Such then is Posidonius' way of dealing with the size of the earth.

4. The method of Eratosthenes1 depends on a geometrical argument and gives the impression of being slightly more difficult to follow. But his statement will be made clear if we premise the following. Let us suppose, in this case too, first, that Syene and Alexandria he under the same meridian circle, secondly, that the distance between the two cities is 5,000 stades; and thirdly, that the rays sent down from different parts of the sun on different parts of the earth are parallel; for this is the hypothesis on which geometers proceed Fourthly, let us assume that, as proved by the geometers, straight lines falling on parallel straight lines make the alternate angles equal, and fifthly, that the arcs standing on (i e., subtended by) equal angles are similar, that is, have the same proportion and the same ratio to their proper circles-this, too, being a fact proved by the geometers. Whenever, therefore, arcs of circles stand on equal angles, if any one of these is (say) one-tenth of its proper circle, all the other arcs will be tenth parts of their proper circles.

5. Any one who has grasped these facts will have no difficulty in understanding the method of Eratosthenes, which is this Syene and Alexandria lie, he says, under the same mendian circle. Since meridian circles are great circles in the universe, the circles of the earth which lie under them are

necessarily also great circles. Thus, of whatever size this method shows the circle on the earth passing through Syene and Alexandria to be, this will be the size of the great circle of the earth Now Eratosthenes asserts, and it is the fact, that Syene lies under the summer tropic. Whenever, therefore, the sun, being m the Crab at the summer solstice, is exactly in the middle of the heaven, the gnomons (pointers) of sundials necessarily throw no shadows, the position of the sun above them being exactly vertical; and it is said that this is true throughout a space three hundred stades in diameter. But in Alexandria, at the same hour, the pointers of sundials throw shadows, because Alexandria lies further to the north than Syene. The two cities lying under the same meridian great circle, if we draw an arc from the extremity of the shadow to the base of the pointer of the sundial in Alexandria, the arc will be a segment of a great circle in the (hemispherical) bowl of the sundial, since the bowl of the sundial lies under the great circle (of the meridian). If now we conceive straight lines produced from each of the pointers through the earth, they will meet at the centre of the earth. Since then the sundial at Svene is vertically under the sun, if we conceive a straight line coming from the sun to the top of the pointer of the sundial, the line reaching from the sun to the centre of the earth will be one straight line. If now we conceive another straight line drawn upwards from the extremity of the shadow of the pointer of the sundial in Alexandria, through the top of the pointer to the sun, this straight line and the aforesaid straight line will be parallel, since they are straight lines coming through from different parts of the sun to different parts of the earth. On these straight lines, therefore, which are parallel, there falls the straight line drawn from the centre of the earth to the pointer at Alexandria, so that the alternate angles which it makes arc equal. One of these angles is that formed at the centre of the earth, at the intersection of the straight lines which were drawn from the sundials to the centre of the earth; the other is at the point of intersection of the top of the pointer at Alexandria and the straight line drawn from the extremity of its shadow to the sun through the point (the top) where it meets the pointer. Now on this latter angle stands the arc carried round from the extremity of the shadow of the pointer to its base, while on the angle at the centre of the earth stands the arc reaching from Svene to Alexandria. But the arcs are similar, since they stand on equal angles. Whatever ratio, therefore, the arc in the bowl of the sundial has to its proper circle, the arc reaching from Syene to Alexandria has that ratio to its proper circle. But the arc in the bowl is found to be one-fiftieth of its proper circle. Therefore the distance from Svene to Alexandria must necessarily be one-fiftieth part of the great circle of the earth. And the said distance is 5,000 stades*; therefore the complete great circle measures 250,000 stades. Such is Eratosthenes method. (The stadion [Greek; plural: stadia, Latin: stadium; English: stade] was an ancient Greek unit of length, consisting of 600 feet [being either the Ptolemaic or Attic foot: $308mm \times 600 = 185m$, or the Olympic foot: $294mm \times 600$ = 176m.].

Eusebius of Caesarea in his Preparatio Evangelica includes a brief chapter of three sentences on celestial distances (Book 15, Chapter 53). He states simply that Eratosthenes found the distance to the Sun to be "of stadia myriads 400 and 80,000") and the distance to the Moon to be 780,000 stadia. The expression for the distance to the Sun has been translated either as 4,080,000 stadia (1903 translation by E. H. Gifford), or as 804,000,000 stadia (edition of Edouard des Places, dated 1974–1991). The meaning depends on whether Eusebius meant 400 myriad plus 80,000 or "400 and 80,000" myriad. With a stade of 185 m (607 ft), 804,000,000 stadia is 149,000,000 km (93,000,000 mi), approximately the distance from the Earth to the Sun.

Topics and Structure

The Natural History is generally divided into the organic plants and animals and the inorganic matter, although there are frequent digressions in each section. The encyclopedia also notes the uses made of all of these by the Romans. Its description of metals and minerals is valued for its detail in the history of science, being the most extensive compilation still available from the ancient world. That work carries an extraordinarily wide range of topics, such as astronomy, meteorology, geography, anthropology, ethnography, physiology, zoology, botany, spices, perfumes, drugs, medicine, magic, astrology, medicine, religion, warfare, technology, agriculture, chemistry, metallurgy, mineralogy, crystallography and mineralogy, art history, roman sculpture and ancient greek sculpture, mining, economy, politics, etc. Book I serves as Pliny's preface, explaining his approach and providing an extremely detailed table of contents. The Natural History consists of 37 books. Pliny devised a summarium, or list of contents, at the beginning of the work that was later interpreted by modern printers as a table of contents. The table below is a summary based on modern names for topics.

The work is divided into 37 books, organised into 10 volumes. These cover topics including astronomy,

mathematics, geography, ethnography, anthropology, human physiology, zoology, botany, agriculture, horticulture, pharmacology, mining, mineralogy, sculpture, art, and precious stones. Pliny's Natural History became a model for later encyclopedias and scholarly works as a result of its breadth of subject matter, its referencing of original authors, and its index.

Contents

- Book 1: Table of contents in detail including the "Authorities," meaning the original sources
- Book 2: Astronomy and meteorology
- Book 3: Geography of the Western Mediterranean
- Book 4: Geography of the Eastern Mediterranean, the Black Sea, continental and northern Europe.
- Book 5: Geography of Africa, the Middle East and Turkey

Book 6: Geography of Asia; summary overview and wrapup of world geography

Book 7: Anthropology and human physiology

Book 8: Land animals: elephants, lions, tigers, panthers; cows, horses, asses, mules, sheep, goats; mice, dormice and a few others

Book 9: Marine animals: whales, dolphins, fish, shellfish, etc

Book 10: Birds; animal reproduction; the five senses

Book 11: Insects, then comparative zoology, fumblings toward a taxonomy

Book 12: Exotic plants, spices and perfumes: from Egypt, Mesopotamia, India, China, etc

Book 13: More plants, including aquatic plants

Book 14: Plants: the vine and wine

Book 15: Plants: the olive tree; oil and its uses; fruit and nut trees

- Book 16: More trees, mostly evergreens Book 17: Fruit trees and vines and the art of planting them
- Book 18: How to run a farm

Book 19: Garden plants, including a long section on flax

Book 20: More garden plants: mostly vegetables.

- Book 21: Flowers.
- Book 22: Miscellaneous plants, including dye plants.

Book 23: Medicinal properties of wine, vinegar, oil, nuts, fruit.

Book 24: Medicinal properties of trees and herbs.

Book 25: Medicinal properties of herbs.

Book 26: Major medicinal herbs. The book opens with a section on new diseases. Book 27: Minor medicinal herbs, in roughly alphabetical

order. Book 28: Medicinal uses of the human body's own products

(and discussion of charms); of animal products.

Book 29: Medicinal uses of animal products, continued; but the book starts with a long stiff diatribe against doctors. Book 30: Medicinal uses of animal products, continued; this

time the book starts with a preamble about magic arts.

Book 31: Medicinal uses of marine products: salt, plants, sponges, etc.

Book 32: Medicinal uses of marine animals.

Book 33: Metals: mostly gold, silver and mercury. Book 34: Metals: bronze and lead; but mostly a discussion of statues. in fact.

Book 35: Uses of earth; but starting with pigments, is mostly a discussion of painters, although the end of the Book goes back to sulphur.

Book 36: Stone. One of the better books. The first half is about sculpture; then a bit of fascinating architecture (obelisks, the Pyramids, the Cretan labyrinth), finally various building materials (plaster, sand, stone), then glass. Ends with a paean to fire and an utterly peculiar story in the very last paragraph.

Book 37: Stones: rock crystal, amber, gemstones; semiprecious stones. At the very end of the Book, Plinius gives his list of "best of categories"; the best of countries is Italy

The Natural History does have structure: Plinius uses Aristotle's division of nature (animal, vegetable, mineral) to recreate the natural world in literary form. Rather than presenting compartmentalised, stand-alone entries arranged alphabetically, his ordered natural landscape is a coherent whole, offering the reader a guided tour: "a brief excursion under our direction among the whole of the works of nature ..." The work is unified but varied: "My subject is the world of nature ... or in other words. life." he tells Titus.

Nature for Pliny was divine, a pantheistic concept inspired by the Stoic philosophy, which underlies much of his thought, but the deity in question was a goddess whose main purpose was to serve the human race: "nature, that is life" is human life in a natural landscape. After an initial survey of cosmology and geography, Pliny starts his treatment of animals with the human race, "for whose sake great Nature appears to have created all other things". This teleological view of nature was common in antiquity and is crucial to the understanding of the Natural History. The components of nature are not just described in and for themselves, but also with a view to their role in human life. Pliny devotes a number of the books to plants, with a focus on their medicinal value; the books on minerals include descriptions of their uses in architecture, sculpture, art, and jewellery. Pliny's premise is distinct from modern ecological theories, reflecting the prevailing sentiment of his time.

Pliny's work frequently reflects Rome's imperial expansion, which brought new and exciting things to the capital: exotic eastern spices, strange animals to be put on display in zoos or private households or herded into the arena. Pliny repeated Aristotle's maxim that Africa was always producing something new. Nature's variety and versatility were claimed to be infinite: "When I have observed nature she has always induced me to deem no statement about her incredible." This led Pliny to recount rumours of strange peoples on the edges of the world. These monstrous races - the Cynocephali or Dog-Heads, the Sciapodae, whose single foot could act as a sunshade, the mouthless Astomi, who lived on scents - were not strictly new. They had been mentioned in the fifth century BC by Greek historian Herodotus (whose history was a broad mixture of myths, legends, and facts), but Pliny made them better known. The Natural History was one of the first ancient European texts to be printed, in Venice in 1469. Philemon Holland's English translation of 1601 has influenced literature ever since.)

DEDICATION.

C.* PLINIUS SECUNDUS TO HIS FRIEND TITUS VESPASIAN*

(Caius or the more modern form Gaius; the friend's full name is Titus Flavius Vespasianus, in English often shortened to either Vespasian, the father, or Titus, the son. Father and son had the very same full name. There is the possibility that this book was dedicated to the son, as well as to the father.)

This treatise on Natural History, a novel work in Roman literature, which I have just completed, I have taken the liberty to dedicate to you, most gracious Emperor, an appellation peculiarly suitable to you, while, on account of his age, that of great is more appropriate to your Father; For still thou never wouldst quite despise The trifles that I write;" if I may be allowed to shelter myself under the example of Catullus, my fellow-countryman, a military term, which you well understand. For he, as you know, when his napkins had been changed4, expressed himself a little harshly, from his anxiety to show his friendship for his dear little Veranius and Fabius5. At the same time this my importunity may effect, what you complained of my not having done in another too forward epistle of mine; it will put upon record, and let all the world know, with what kindness you exercise the imperial dignity. You, who have had the honour of a triumph, and of the censorship, have been six times consul, and have shared in the tribunate; and, what is still more honourable, whilst you held them in conjunction with your Father, you have presided over the Equestrian order, and been the Prefect of the Prætorians: all this you have done for the service of the Republic, and, at the same time, have regarded me as a fellowsoldier and a messmate. Nor has the extent of your prosperity produced any change in you, except that it has given you the power of doing good to the utmost of your wishes. And whilst all these circumstances increase the veneration which other persons feel for you, with respect to myself, they have made me so hold, as to wish to become more familiar. You must, therefore, place this to your own account, and blame yourself for any fault of this kind that I may commit.

But, although I have laid aside my blushes, I have not gained my object; for you still awe me, and keep me at a distance, by the majesty of your understanding. In no one does the force of eloquence and of tribunitian oratory blaze out more powerfully! With what glowing language do you thunder forth the praises of your Father! How dearly do you love your Brother [Titus Flavius Domitianus]! How admirable is your talent for poetry! What a fertility of genius do you possess, so as to enable you to imitate your Brother! But who is there that is bold enough to form an estimate on these points, if he is to be judged by you, and, more especially, if you are challenged to do so? For the case of those who merely publish their works is very different from that of those who expressly dedicate them to you. In the former case I might say, Emperor! why do you read these things? They are written only for the common people, for farmers or mechanics, or for those who have nothing else to do; why do you trouble vourself with them? Indeed, when I undertook this work. I did not expect that you would sit in judgement upon me9; I considered your situation much too elevated for you to descend to such an office. Besides, we possess the right of openly rejecting the opinion of men of learning. M. Tullius himself, whose genius is beyond all competition, uses this privilege; and, remarkable as it may appear, employs an advocate in his own defence ---- "I do not write for very learned people; I do not wish my works to be read by Manius Persius, but by Junius Congus." And if Lucilius, who first introduced the satirical style, applied such a remark to himself, and if Cicero thought proper to borrow it, and that more especially in his treatise "De Republica," how much reason

have I to do so, who have such a judge to defend myself against! And by this dedication I have deprived myself of the benefit of challenge; for it is a very different thing whether a person has a judge given him by lot, or whether he voluntarily selects one; and we always make more preparation for an invited guest, than for one that comes in unexpectedly.

When the candidates for office, during the heat of the canvass, deposited the fine in the hands of Cato, that determined opposer of bribery, rejoicing as he did in his being rejected from what he considered to be foolish honours, they professed to do this out of respect to his integrity; the greatest glory which a man could attain. It was on this occasion that Cicero uttered the noble ejaculation, "How happy are you, Marcus Porcius, of whom no one dares to ask what is dishonourable!" When L. Scipio Asiaticus appealed to the tribunes, among whom was Gracchus, he expressed full confidence that he should obtain an acquittal, even from a judge who was his enemy. Hence it follows, that he who appoints his own judge must absolutely submit to the decision; this choice is therefore termed an appeal.

I am well aware, that, placed as you are in the highest station, and gifted with the most splendid eloquence and the most accomplished mind, even those who come to pay their respects to you, do it with a kind of veneration: on this account I ought to be careful that what is dedicated to you should be worthy of you. But the country people, and, indeed, some whole nations offer milk to the Gods16, and those who cannot procure frankincense substitute in its place salted cakes: for the Gods are not dissatisfied when they are worshiped by every one to the best of his ability. But my temerity will appear the greater by the consideration, that these volumes, which I dedicate to you, are of such inferior importance. For they do not admit of the display of genius, nor, indeed, is mine one of the highest order; they admit of no excursions, nor orations, nor discussions, nor of any wonderful adventures, nor any variety of transactions, nor, from the barrenness of the matter, of anything particularly pleasant in the narration, or agreeable to the reader. The na- ture of things, and life as it actually exists, are described in them; and often the lowest department of it; so that, in very many cases, I am obliged to use rude and foreign, or even barbarous terms and these often require to be introduced by a kind of preface. And, besides this, my road is not a beaten track, nor one which the mind is much disposed to travel over. There is no one among us who has ever attempted it, nor is there any one individual among the Greeks who has treated of all the topics. Most of us seek for nothing but amusement in our studies, while others are fond of subjects that are of excessive subtilty. and completely involved in obscurity. My object is to treat of all those things which the Greeks include in the Encyclopædia, which, however, are either not generally known or are rendered dubious from our ingenious conceits. And there are other matters which many writers have given so much in detail that we quite loathe them. It is, indeed, no easy task to give novelty to what is old, and authority to what is new: brightness to what is become tarnished, and light to what is obscure; to render what is slighted acceptable, and what is doubtful worthy of our confidence; to give to all a natural manner, and to each its peculiar nature. It is sufficiently honourable and glorious to have been willing even to make the attempt, although it should prove unsuccessful. And, indeed. I am of opinion, that the studies of those are more especially worthy of our regard, who, after having overcome all difficulties, prefer the useful office of assisting others to the mere gratification of giving pleasure; and this is what I have already done in some of my former works. I confess it surprises me, that T. Livius, so celebrated an author as he is, in one of the books of his history of the city from its origin, should begin with this remark, "I have now obtained a sufficient reputation, so that I might put an end to my work, did not my restless mind require to be supported by employment. Certainly he ought to have composed this work, not for his own glory, but for that of the Roman name, and of the people who were the conquerors of all other nations. It would have been more meritorious to have persevered in his labours from his love of the work, than from the gratification which it afforded himself, and to have accomplished it, not for his own sake, but for that of the Roman people.

I have included in thirty-six19 books 20,000 topics, all worthy of attention, (for, as Domitius Piso says, we ought to make not merely books, but valuable collections,) gained by the perusal of about 2000 volumes, of which a few only are in the hands of the studious, on account of the obscurity of the subjects, procured by the careful perusal of 100 select authors21; and to these I have made considerable additions of things, which were either not known to my predecessors, or which have been lately discovered. Nor can I doubt but that there still remain many things which I have omitted; for I am a mere mortal and one that has many occupations. I have therefore, been obliged to compose this work at interrupted intervals, indeed during the night, so that you will find that I have not been idle even during this period. The day I devote to you, exactly portioning out my sleep to the necessity of my health, and contenting myself with this reward, that while we

are musing on these subjects (according to the remark of Varro), we are adding to the length of our lives; for life properly consists in being awake.

In consideration of these circumstances and these difficulties, I dare promise nothing; but you have done me the most essential service in permitting me to dedicate my work to you. Nor does this merely give a sanction to it, but it determines its value; for things are often conceived to be of great value, solely because they are consecrated in temples.

I have given a full account of all your family—your Father, yourself, and your Brother, in a history of our own times, beginning where Aufidius Bassus concludes. You will ask, Where is it? It has been long completed and its accuracy confirmed; but I have determined to commit the charge of it to my heirs, lest I should have been suspected, during my lifetime, of having been unduly influenced by ambition. By this means I confer an obligation on those who occupy the same ground with myself; and also on posterity, who, I am aware, will contend with me, as I have done with my predecessors.

You may judge of my taste from my having inserted, in the beginning of my book, the names of the authors that I have consulted. For I consider it to be courteous and to indicate an ingenuous modesty, to acknowledge the sources whence we have derived assistance, and not to act as most of those have done whom I have examined. For I must inform you, that in comparing various authors with each other. I have discovered. that some of the most grave and of the latest writers have transcribed, word for word, from former works, without making any acknowledgement; not avowedly rivalling them, in the manner of Virgil, or with the candour of Cicero, who, in his treatise "De Republica," professes to coincide in opinion with Plato, and in his Essay on Consolation for his Daughter, says that he follows Crantor, and, in his Offices, Panæcius; volumes, which, as you well know, ought not merely to be always in our hands, but to be learned by heart. For it is indeed the mark of a perverted mind and a bad disposition, to prefer being caught in a theft to returning what we have borrowed, especially when we have acquired capital, by usurious interest.

The Greeks were wonderfully happy in their titles. One work they called know, which means that it was as sweet as a honeycomb; another KEPA Σ 'AMAA Θ EIA Σ , or Cornu copiæ, so that you might expect to get even a draught of pigeon's milk from it. Then they have their Flowers, their Muses, Magazines, Manuals, Gardens, Pictures, and Sketches, all of them titles for which a man might be tempted even to forfeit his bail. But when you enter upon the works, O ye Gods and Goddesses! how full of emptiness! Our duller countrymen have merely their Antiquities, or their Examples, or their Arts. I think one of the most humorous of them has his Nocturnal Studies, a term employed by Bibaculus; a name which he richly deserved. Varro, indeed, is not much behind him, when he calls one of his satires A Trick and a Half, and another Turning the Tables. Diodorus was the first among the Greeks who laid aside this trifling manner and named his history The Library. Apion, the grammarian, indeed-he whom Tiberius Cæsar called the Trumpeter of the World, but would rather seem to be the Bell of the Town-crier, supposed that every one to whom he inscribed any work would thence acquire immortality. I do not regret not having given my work a more fanciful title.

That I may not, however, appear to inveigh so completely against the Greeks, I should wish to be considered under the same point of view with those inventors of the arts of painting and sculpture, of whom you will find an account in these volumes, whose works, although they are so perfect that we are never satisfied with admiring them, are inscribed with a temporary title35, such as "Apelles, or Polycletus, was doing this;" implying that the work was only commenced and still imperfect, and that the artist might benefit by the criticisms that were made on it and alter any part that required it, if he had not been prevented by death. It is also a great mark of their modesty, that they inscribed their works as if they were the last which they had executed, and as still in hand at the time of their death. I think there are but three works of art which are inscribed positively with the words "such a one executed this;" of these I shall give an account in the proper place. In these cases it appears, that the artist felt the most perfect satisfaction with his work, and hence these pieces have excited the envy of every one.

I, indeed, freely admit, that much may be added to my works; not only to this, but to all which I have published. By this admission I hope to escape from the carping critics36, and I have the more reason to say this, because I hear that there are certain Stoics and Logicians, and also Epicureans (from the Grammarians I expected as much), who are big with something against the little work I published on Grammar; and that they have been carrying these abortions for ten years together—a longer pregnancy this than the elephant's. But I well know, that even a woman once wrote against Theophrastus, a man so eminent for his eloquence that he obtained his name, which signifies the Divine speaker, and that from this circumstance originated the proverb of choosing a tree to hang oneself.

I cannot refrain from quoting the words of Cato the censor, which are so pertinent to this point. It appears from them, that even Cato, who wrote commentaries on military discipline43, and who had learned the military art under Africanus, or rather under Hannibal (for he could not endure Africanus44, who, when he was his general, had borne away the triumph from him), that Cato, I say, was open to the attacks of such as caught at reputation for themselves by detracting from the merits of others. And what does he say in his book? "I know, that when I shall publish what I have written, there will be many who will do all they can to depreciate it, and, especially, such as are themselves void of all merit; but I let their harangues glide by me." Nor was the remark of Plancus a bad one, when Asinius Pollio was said to be preparing an oration against him, which was to be published either by himself or his children, after the death of Plancus, in order that he might not be able to answer it: "It is only ghosts that fight with the dead." This gave such a blow to the oration, that in the opinion of the learned generally, nothing was ever thought more scandalous. Feeling myself, therefore, secure against these vile slanderers, a name elegantly composed by Cato, to express their slanderous and vile disposition (for what other object have they, but to wrangle and breed quarrels?), I will proceed with my projected work.

And because the public good requires that you should be spared as much as possible from all trouble, I have subjoined to this epistle the contents of each of the following books, and have used my best endeavours to prevent your being obliged to read them all through. And this, which was done for your benefit, will also serve the same purpose for others, so that any one may search for what he wishes, and may know where to find it. This has been already done among us by Valerius Soranus, in his work which he entitled "On Mysteries."

NATURAL HISTORY BOOK 1

TABLE OF CONTENTS AND AUTHORITIES

Book 2. Contents (1-3) The world is it finite? is it one? its shape: its motion: reason for its name. (4) The elements. (5) God. (6) The planetstheir nature. (7) Eclipses, solar and lunar. Night. (8-10) The starstheir magnitude; astronomical discoveries. (xi) The moon's motion.(xii-xvi). Motions of the planets; theory of their light; causes of apparent recession and approach; general properties of planets; reason for changes of colour. (xvii) The sun's motion; reason for inequality of days. (xviii) Thunderbolts, why attributed to Jove. (xix) The starstheir distances apart. (xx) Music from the stars. (xxi) Dimensions of the world. (xxii, xxiii) Shooting stars. Comets; their nature, position and kinds. (xxiv) Identification of stars--method of Hipparchus. (xxv-xxxv) Sky portentsrecorded instances torches, shafts, skybeams, sky-yawning, colours of the sky, sky-flame, sky-wreaths, sudden rings, prolonged solar eclipses, several suns, several moons, daylight at night, burning shield; an unique sky-portent. (xxxvi) Disruption of stars. (xxxvii) The 'Castores.' (xxxviii) The air. (xxxix-xli). Fixed seasons. Rise of dogstar. Regular effect of seasons. (xlii, iii) Irregular seasons. Rain storms. Showers of stones, their reason. Thunderbolts and lightnings. (xliv-viii) Echoits reason. Windstheir Winds, natures and behaviour. (xlix, i). Cloud-burst, typhoon, whirlwinds, presteres, tornadoes, other portentous kinds of storms. (li-vi) Thunderboltswhat countries immune from them and why; their kinds, their peculiarities; Tuscan and Roman observances connected with; method of calling down; general properties; what objects never struck. (lvii) Showers of milk, blood, flesh, iron, wool, bricks. (lviii) Portents.(lix) Stones falling from the skyAnaxagoras as to. (lx) Rainbow. (lxi). Nature of hail. snow, frost, cloud, dew. (lxii) Local peculiarities of the sky. (lxiii-v) Nature of the earth; its shape; antipodesdo they exist? (lxvi-viii) Waterhow linked with earth? Rivers--their reason. Is the earth surrounded by the ocean? What portion of the earth is inhabited? (lxix). The earth at the centre of the world. (lxx) Obliquity of zones. Inequality of climates. (lxxii) Eclipseswhere invisible, and why? (lxxiii) Reason for daylight on earth; gnomonics of daylight. (xxv-vii). Absence of shadowswhere and when? where twice yearly? where shadows travel in opposite direction? Where days are longest and shortest? (lxxviii) The first clock. (lxxix) How days are observed. (lxxx) Racial difference and latitude. (lxxxi-vi) Earthquakes. Chasms. Signs of impending earthquake. Precautions against impending earthquakes. Records of unique earth portents. Marvels of earthquake. (lxxxvii-xciv) treat of sea, where occurred? Emergence of islands reason for; instances and dates of. Disruption of straits. Junction of islands with mainland. Total inundation. Shrinkage of land areas. Cities engulfed by sea. (xcv) Air-holes. (xcvi) Continuous earth-tremors. Islands in constant agitation. (xcvii) Places where rain does not fall. (xcviii) Collection of earth marvels. (xcix f.) Rise and fall of tidesreason for. Where do irregular tides occur? (ci-cv) Marvels of the sea: influence of the moon on earth and sea; of the sun; why is the sea salt? where is it deepest? (cvi) Remarkable properties of springs

and rivers. (cvii-cx) Combined marvels of fire and water: mineral pitch; naphtha; regions constantly glowing. (cxi) Marvels of fire alone. (cxii) Dimensions of entire earth. (cxiii) Harmonic principle of the world.Total: 417 facts, investigations and observations.

Authorities: Marcus Varro, Sulpicius Gallus, the Emperor Titus Caesar, Quintus Tubero, Tullius Tiro, Lucius Piso, Titus Livy, Cornelius Nepos, Sebosus, Caelius Antipater. Fabianus, Antias, Mucianus, Caecina On the Tuscan System, Tarquitius ditto, Julius Aquila ditto, Sergius Paullus. Foreign authorities; the Pythagorean writers, Hipparchus, Timaeus, Sosigenes, Petosiris, Nechepsus, Posidonius, Anaximander, Epigenes, Eudoxus, Democritus, Critodemus, Thrasyllus, Serapion On Sun-dials, Euclid, Coeranus the philosopher. Dicaearchus. Archimedes. Onesicritus. Pytheas, Herodotus, Aristotle, Ctesias, Eratosthenes, Artemidorus of Ephesus, Isidore of Charax, Theopompus.

Book 3. Contents: sites, races, seas, towns, harbours, mountains, rivers, dimensions, present and past populations of (iii) Baetica, (iv) North-east Spain, (v) Province of Narbonne, (vi-x) Italy to the southernmost point, (ix the Tiber, Rome), (xi-xiv) 64 islands (including the Balearics, Corsica, Sardinia, Sicily), (xv-xxii) Italy from the south to Ravenna (the Po), Transpadane Italy, (xxiii) Istria, (xxiv) the Alps and Alpine races, (xxv-xxx) Illyria, Liburnia, Dalmatia, Noricum, Pannouia, Moesia, Ionian and Adriatic islands. Totals: ... famous rivers; famous mountains; ... islands; ... extinct towns or races; ... facts, researches and observations.

Authorities: Turanius Gracilis, Cornelius Nepos, Livy, Cato the Censor, Marcus Agrippa, Marcus Varro, His Late Majesty Augustus, Varro of Atax, Antias, Hyginus, Lucius Vetus, Pomponius Mela, the elder Curio, Caelius, Arruntius, Sebosus, Licinius Mucianus, Fabricius Tuscus, Lucius Ateius, Ateius Capito, Verrius Flaccus, Lucius Piso, Gellianus, Valerian. Foreign authorities: Artemidorus, Alexander the Learned, Thucydides, Theophrastus, Isidorus, Theopompus, Metrodorus of Scepsis, Callicrates, Xenophon of Lampsacns, Diodorus of Syracuse, Nymphodorus, Calliphanes, Timagenes.

Book 4. Contents: sites, races, seas, towns, harbours, mountains, rivers, dimensions, present and past populations of (i-iv) Epirus, (v-x) Achaia, (xi-xiii) Greece, (xiv-xviii) Thessaly, Magnesia, Macedonia, Thrace, (xix-xviii) islands off these coasts, including Crete, Euboea, the Cyclades, the Sporades, (xxiv) Dardanelles, Black Sea, Sea of Azoy, (xxv. f.) Dacia, Sarmatia, Seythia, (xxvii) Islands of black Sea, (xxviii f.) Germany, (xxx) North Sea Islands, 96 including Britain, (xxxi-xxxiii) Belgium, Lyonnaise, Aquitaine, (xxxiv) Northeastern Spain, (xxxv) Western Spain and Portugal. (xxxvi) Atlantic islands. (xxxvii) Dimensions of the whole of Europe.Totals ... towns and races; ... famous rivers; ... famous mountains; ... islands; extinct towns or races; ... facts, investigations and observations.

Authorities: Cato the Censor, Marcus Varro, Marcus Agrippa, His Late Majesty Augustus, Varro of Atax, Cornelius Nepos, Hyginus, Lucius Vetus, Pomponius Mela, Licinius Mucianus, Fabricius Tuscus, Ateius Capito, Ateius the scholar. Foreign authorities: Polybius, Hecataeus, Hellanicus, Damastes, Eudoxus, Dicaearchus, Timosthenes, Eratosthenes, Ephorus, Crates the philologist, Serapion of Antioch, Callimachus, Artemidorus, Apollodorus, Agathocles, Timaeus of Sicily, Myrsilus, Alexander the Learned, Thucydides, Dosiades, Anaximander, Philistides of Mallus, Dionysius, Aristides, Callidemus, Menaechmus, Aglaosthenes, Anticides, Heraclides, Philemon, Xenophon, Yuthas, Isidore, Philonides, Xenagoras, Astynomos, Staphylus, Aristocritus, Metrodorus, Cleobulus, Posidonius.

Book 5. Contents:sites, races, seas, towns, harbours, mountains, rivers, dimensions, present and past populations of (i-viii) the Mauritanias, Numidia, Africa, the Syrtes, Cyrenaiea, African islands, remote parts of Africa, (ix-xi) EgyptChora, Thebaid, Nile, (xii) Arabian coast of Egyptan Sea, (xiii-xix) Idumea, Syria, Palestine, Samaria, Judaca, Phoenicia, Hollow Syria, Syria of Antioch, (xx-xxxiii) Euphrates, Cilicia and adjoining races, Isaurica, Omauads, Pisidia, Lycaonia, Pamphylia, Taurus Mountain, Lyci, Caria, Ionia, Aeolid, Troad and adjoining races, (xxxiv-ix) Islands on Asiatic coast (212) including Cyprus, Rhodes, Cos, Samos, Chios, Lesbos, (xl-xliii) Dardanelles, Mysia, Phrygia, Galatia and adjoining races, Bithynia.Totals: ... towns and races; ... famous dyers; ... famous mountains; 118 islands; ... extinct towns and races: facts. investigations and observations.

Authorities: Agrippa, Suetonius Paulinus, Marcus Varro, Varro of Atax, Cornelius Nepos, Hyginus, Lucius Vetus, Mela, Domitius Corbulo, Licinins Mucianus, Claudius Caesar, Arruntius, Livy junior, Sebosus, TriumphsOfficial records. Foreign authorities: King Juba, Hecataeus, Hellanicus, Damastes, Dicaearchus, Baeto, Timosthenes, Philonides, Xenagoras, Astynomus, Staphylus, Dionysius, Aristotle, Aristocritus, Ephorus, Eratosthenes, Hipparchus, Panaetius, Serapio of Antioch, Callimachus, Agathocles, Polybius, Timaeus the mathematician, Herodotus, Myrsilus, Alexander the Learned, Metrodorus, Posidonius's Circumnavigation or Round Guide, Sotades, Pindar, Aristarchus of Sicyon, Eudoxus, Antigenes, Callicrates, Xenophon of Lampsacus, Diodorus of Syracuse, Hanno, Himileo, Nymphodorus, Calliphanes, Artemidorus, Megasthenes, Isidore, Cleobulus, Aristocreon.

Book 6. Contents:sites, races, seas, towns, harbours, mountains, rivers, dimensions, present and past populations of (i) Pontus, Mariandyni, (ii) Paphlagonia, (iii, viii) Cappadocia, (iv) region of Themiscyra and its races, Heniochi, (v) Colic region and races. Achaean races, other races in the same area, (vi-xii) Cimmerian Bosphorus, Maeotis and adjacent races, Lesser Armenia, Greater Armenia, River Cyrus, River Araxes, Albania, Iberia and adjoining Gates of Caucasia, (xiii) Black Sea Islands, (xiv) races towards the Scythian Ocean, (xv-xix) Caspian and Hyrcanian Sea, Adiabene, Media, Caspian Gates, races round Hyrcanian Sea, Scythian races, (xx-xxxvi) regions towards the Eastern Sea, China, India (Ganges, Indus), Taprobane, Arians and adjoining races, voyages to India, Carmania, Persian Gulf, Parthian kingdoms, Mesopotamia, Tigris, Arabia, Gulf of Red Sea, Trogodyte country, Ethiopia, Islands of Ethiopian Sea (xxxvii) The Fortunate Islands (xxxviii f.) Lands compared by measurements, division of lands into parallels and equal shadows. Totals: 1195 towns; 576 races, 115 famous rivers, 38 famous mountains, 108 islands, 95 extinct towns and races; 2214 facts and investigations and observations.

Authorities: Marcus Agrippa, Marcus Varro, Varro of Atax, Cornelius Nepos, Hyginus, Lucius Vetus, Pomponius Mela, Domitius Corbulo, Licinius Mucianus, Claudius Caesar, Arruntius, Sebosus, Fabricius Tuscus, Titus Livy junior, Seneca, Nigidius. Foreign authorities: King Juba, Hecataeus, Hellanicus, Damastes, Eudoxus, Dicaearchus, Baeto, Patrocles, Clitarchus, Timosthenes Demodamas Eratosthenes, Alexander the Great, Ephorus, Hipparchus, Callimachus, Artemidorus, Apollodorus, Polybius, Timaeus of Sicily, Alexander the Panaetius, Agathocles. Learned, Isidore, Amometus, Metrodorus, Posidonius, Onesicritus, Nearchus, Megasthenes, Diognetus, Aristocreon, Bion, Dalion, the younger Simonides, Basilis, Xenophon of Lampsacus.

Book 7. Contents: (ii f.) Remarkable racial bodily configurations: monstrous births. (iv-xi) Human generation: periods of pregnancy from 7 months to 13 shown by famous examples; significant prenatal indications of sex in the pregnant; monstrous births, cases of surgical delivery; meaning of vopiscus; human conception; human generation; cases of likeness; cases of very numerous progeny. (xii) Agelimit of procreation. (xiii) Exceptional periods of pregnancy. (xiv) Theory of generation. (xv) Investigation as to teeth: as to infants. (xvi f.) Instances of exceptional size. Premature births. (xviii-xxiii) Bodily distinctions, exceptional strength, remarkable speed, exceptional sight, marvellous hearing, bodily endurance. (xxiv-xxvi) Memory, mental rigour, clemency, magnanimity. (xxvii) Supremely distinguished exploits. (xxviii-xxxi) Three supreme virtues in the same person, supreme innocence, supreme bravery, exceptional talents. Who are the wisest men? (xxxii) The most useful rules of conduct. (xxxiii) Divination. (xxxiv-vi). The man deemed the best, the most chaste matrons; instances of extreme piety. (xxxvii-ix) Cases of eminence in the sciences and arts. astronomy, philology, medicine, geometry, architecture, painting, sculpture in bronze, in marble, in ivory; engraving. (xl-xlvi) Remarkable prizes of mankind; supreme happiness; rarity of its continuance in families; remarkable cases of change of fortune; twice proscribed; remarkable cases of honours; ten supremely happy things in the case of a single person; misfortunes of his late Majesty Augustus. (xlvii f.) Whom the gods have judged happiest; what man they have commanded to be worshipped as a god in his lifetime. A remarkable flash of lightning. (xlix) Cases of exceptional longevity. (1) Various modes of birth. (ii) Diseases in various cases. (lii-lvi) Death; cases of the dead coming to life again; instances of sudden death; burial; ghosts; the soul. (lvii-lx) Discoveries in life: matters on which there was the earliest agreement of the races; ancient literature; date of earliest barbers, earliest time-pieces. Total: 747 facts, investigations and observations.

Authorities: Verrius Flaccus, Gnaeus Gellius, Licinius Mucianus, Masurins Sabinus, Agrippina wife of Claudius, Marcus Cicero, Asinius Pollio, Marcus Varro, Messala Rufus, Cornelius Nepos, Virgil, Livy, Cordus, Melissus, Sebosus, Cornelius Celsus, Valerius Maximus, Trogus, Nigidius Figulus, Pomponius Atticus, Pedianus Asconius, Fabianus, Cato the Censor, Official Records, Fabius Vestalis. Foreign authorities: Herodotus, Aristeas, Baeton, Isigonus, Crates, Agatharchides, Calliphanes, Aristotle, Nymphodorus, Apollonides, Phylarchus, Damon, Megasthenes, Ctesias, Tauron, Eudoxus, Onesicritus, Clitarchus, Duris Artemidorus, the medical authors Hippocrates and Asclepiades, Hesiod, Anacreon, Theopompus, Hellanicus, Damastes, Éphorus, Épigenes, Berosus, Petosiris, Nechepsus, Alexander the Learned, Xenophon, Callimachus, Democritus, the historian Diyllus, Strato's Reply to Ephorus's 'Heuremata,' Heraclides of Pontus, the Tragoedumena of Asclepiades, Phulostephanus, Hegesias, Archemachus, Thucydides, Mnesigiton, Xenagoras, Metrodorus of Scepsis, Anticides, Critodemus.

Book 8. Contents: (i-xi) Elephants, their sense; when first harnessed; their docility; remarkable achievements of; instinctive sense of dangers in wild animals; elephants, when first seen in Italy; fights between elephants; modes of capture; modes of domestication; their propagation, and general physiology: native habitat: hostility between elephants and great snakes. (xii) Intelligence of animals. (xiii) Great snakes. (xiv) Serpents of remarkable size. (xv f.) Animals of Scythia; of the north; bisons, bears, the elk, the achlisf the varieties, their characteristics; with lions in the circus at Lionstheir mode of with the largest number first harnessed lions to a among the exploits of lions. (xxii) Man recognised and rescued by a great snake. (xxiii f.) Panthers, resolution of senate and laws as to African; who first showed African panthers at Rome, and when? who showed the largest number? (xxv) Tigers; when was a tiger first seen at Rome? nature of tigers; tiger-cubs. (xxvi-xxx) Camels; their kinds. The giraffe; when first seen at Rome. The spotted lynx. The cephi. The rhinoceros. The lynx and the sphynxes. The crocottae [hyena?]. The long-tailed monkeys. (xxxi-iv) Land animals of India; ditto of Ethiopia; a creature the sight of which brings death; basilisksnakes; wolves; source of the fabulous werewolf. (xzxvxl) Snakes, species of; the ichneumon; the crocodile; the African lizard; the hippopotamus: who first showed this animal, and the crocodile at Rome, (xli-iii), Drugs obtained from animals; warnings of dangers from animals; races destroyed by animals. (xliv f.) Hyenas; corocottae; mantichorae. (xlvi) Wild asses. (xlvii-ix) Amphibious species: beavers, otters, the sea-calf, geckoes. (1) Stags. (ii f.) Chameleon; other species that change colour--reindeer, lycaon, jackal (liii) The porcupine, (liv) Bears; their reproduction. (ly-viii) Mice. Black Sea and Alpine: hedgehogs. lion-killer, lynxes, badgers, squirrels. (lix f.) Snails; lizards. (lx-lxiii). Dogs, nature of; instances of relation to masters; nations that have kept dogs of war; dog-breeding; cures for rabies. (lxiv-vii) Nature of horsesequine psychology; remarkable four-in-hands; horse-breeding; cases conception by wind. (lxviii) Asses; breeding in their case. (lxix) Nature of mules and other draft-animals. (lxx f.) Oxen. breeding of. Apis in Egypt. (lxxii-v) Nature of sheeptheir breeding; kinds of wool and of colours; kinds of cloth. (lxxvi f.) Goats, their nature and breeding; swine, ditto. (lxxviii f.) Wild pigs. Who originated menageries? (lxxx-ii) Apes. Hares, their kinds. Half-wild animals. (lxxxiii) What animals do not occur in what places? which in what places harm only strangers? which in what places only natives?Total: 787 facts, investigations and observations.

Authorities: Mucianus, Procilius, Verrius Flaccus, Lucius Piso, Cornelius Valerianus, Cato the ex-Censor, Fenestella, Trogus, Official Records, Columella, Virgil, Varro, Lucilius, Metellus Scipio, Cornelius Celsus, Nigidius, Trebius Niger, Pomponius Mela, Mamilius Sura, Foreign authorities: King Juba, Polybius, Herodotus, Antipater, Aristotle, Demetrius's Natural History, Democritus, Theophrastus, Euanthes, Scopas's Olympic Victors, King Hiero, King Attalus, King Philometor, Ctesias, Doris, Philisto, Archytas, Phylarchus, Amphilochus of Athens, Anaxipolis of Thasos, Apollodorus of Lemnos, Aristophanes of Miletus, Antigonus of Cumae, Agathocles of Chios, Apollonius of Pergamum, Aristander of Athens, Bacchius of Miletus, Bio of Soil, Chaeareas of Athens, Diodorus of Priene, Dio of Colophon, Epigenes of Rhodes, Euagon of Thasos, Euphronius of Athens, Hegesias of Maronea, Menander of Priene and Menander of Heraclea, the poet Menecrates, Androtion On Agriculture, Aeschrion ditto, Lysinachus ditto, Dionysius's translation of Mago, Diophanes's summary of Dionysius, King Archelaus, Nicander

Book 9. Subject he nature of aquatic animals. (i) Extreme size of marine animals, reason for. (ii) Monsters of the Indian Sea. (iii) Which are the largest in each Ocean? (iv) Tritons and Nereids, shapes of. Sea elephants, shapes of. (v) Whales, grampuses. (vi) Do fishes breathe? do they sleep? (vii-x) Dolphins, persons loved by: places where they fish in partnership with men; other curious facts as to. (xi) Porpoises. (xii f.) Tortoiseskinds of water-tortoise; mode of capture; who invented cutting tortoise-shells (xiv) Aquatic animals arranged by species. (xv) Sea-calves or sealswhich species are hairless? mode of reproduction. (xvi) How many kinds of fish? (xvii-xix). The largest fishes; tunny-fry, young tunny, full-grown tunny; tunny divided and pickled, salted tunny slices, chopped tunny; amia-tunny, mackerel-tunny. (xx) Fishes in the Black Seawhich species not found in it, which enter in from elsewhere, which leave it. (xxi) Why fishes leap out of the water. The sword-fish. (xxii) Augury from fishes a fact. (xxiii- v) Species of that have no males: that have a stone in the head; that hibernate in winter: that are only caught on certain days in winter; that hide in summer; that are liable to planetstroke. (xxvi-xxx) Mullet, sturgeon, pike, cod, wrasse, lamprey; varieties of mullet; the sargus. (xxxi f.) Remarkable prices for fish. Different kinds popular in different places. (xxxiii) Gills in various species; scales ditto. (xxxiv f.) Fish

with voice, fish without gills; fish that go ashore. Seasons for catching fish. (xxxvi) Classification of fish by shape. Difference between turbot and sparrow-turbot. Long fishes. (xxxvii) Fins and mode of swimming. (xxxviii) Eels. (xxxix) Lampreys. (xl) Kinds of flat-fish. (xli) The remora and how it operates. (xlii) What fish change colours. (xhii) Swallow-fish. The fish that shines by night. The homed fish. The weever. (xliv) The bloodless fishes. The so-called soft fishes. (xlv) The sepia fish. The cuttle-fish. The small scallops, flying fish. (xlviix) The polyps, including the sailing polyp. The sailor-fish. (llii) Shell-fish: lobster, varieties of crab, the sea-pen's guard, sea-urchins, snails, scallops. Varieties of shell. (liii) Quantity of delicacies supplied by the sea. (liv-lix) Pearlshow do they grow and where, how found; varieties of large pearltheir remarkable features, their nature, instances of their occurrence, when first used at Rome. (lx-lxv) Nature of varieties of purplethe purple-fish; kinds of purple-fish; how used to supply dye for woollens; date of use of purple at Borne. date of purple stripe and purple-bordered robe; purple dyed dresses; dying amethyst; Tyrian, vegetable-scarlet, kermesscarlet. (lxvi) The sea-pen sea-pen's guard. (lxvii) Perception of aquatic animals: the electric ray, stingray, scolopendrae, shad, ramming-fish. (lxviii f.) Species intermediate between animal and vegetable: sea-nettles; sponges, their kinds and habitat; sponges, living creatures. (lxx) Sea-bitches. (lxxi) Flint-shell fish; marine animals without senses; other low species. (lxxii) Venomous marine animals. (lxxiii) Diseases of fishes. (lxxiv-vii) Their reproduction curious, reproductive methods; species both oviparous and viviparous; delivery by rupture of the stomach, afterwards closing up; species possessing matrix; self-fertilizing species. (lxxviii) Longest life of fish. (lxxix-lxxxi) First inventor of fish-ponds; oysters; who invented lamprey-ponds. Notable fish-ponds; who first invented snail-ponds. (lxxxiii) Land fishes. (lxxxiv) Mouse-fish in the Nile. (lxxxv) Flower-fish, mode of catching. (lxxxvi) Starfish. (lxxxvii) Remarkable species of finger-fish. (lxxxviii) Instances of hostility and friendship between aquatic animals.Total: 650 facts, investigations and observations.

Authorities: Turranins Gracilis, Trogus, Maecenas, Alfius Flavus, Cornelius Nepos, the Mimes of Laberius, Fabianus, Fenestella, Mucianus, Aelius Stilo, Sebosus, Melissus, Seneca, Cicero, Aemilius Macer, Corvinus Messala, Trebius Niger, Nigidius. Foreign authorities: Aristotle, King Archelaus, Callimachus, Democritus, Theophrastus, Thrasyllus, Hegesidemus, Sudines, Alexander the Learned.

Book 10. Subject he nature of birds. (i f.) The ostrich, the phoenix. (iii-vi) Eagles, their species; their nature; when adopted as regimental badges; self-immolation of eagle on maiden's funeral pyre. (vii) The vulture. (viii) Lmmergeier. sea-eagle (1) (ix-xi) Hawks: the buzzard; use of hawks by fowlers where practised; the only bird that is killed by its own kind; what bird produces one egg at a time. (xii) Kites. (xiii) Classification of birds by species. (xiv-xvi) Birds of ill-omen; in what months crows are not a bad omen; ravens; the horned owl. (xvii) Extinct birds: birds no longer known. (xviii) Birds hatched tail first. (xix) Night-owls. (xx) Mars's woodpecker. (xxi) Birds with hooked talons. (xxii-v) Birds with toes: peacocks; who first killed the peacock for food; who invented fattening peacocks; poultrymode of castrating; a talking cock (xxvi-xxxii) The goose who first introduced goose-liver (foie gras); Commagene goose; fox-goose, love-goose, heath-cock, bustard; cranes; storks; rest of reflexed-claw genus; swans. (xxxiii-v) Foreign migrant birds: quails, tongue-birds, ortolan, horned owl; native migrant birds and their destinationsswallows, thrushes, blackbirds, starlings; birds that moult in retirement: turtle-dove, ring-dove. (xxxvi) Nonmigrant birds: half-yearly and quarter-yearly visitors: wit.walls, hoopoes. (xxxvii-xl) Mernnon's hens, Meleager's sisters (guinea-hens), Seleucid hens, ibis. (xli) Where particular species not known. (xlii-v) Species that change colour and voice: the divination-bird class; nightingale, black-cap, robin, red-start, chat, golden oriole. (xlvi) The breeding season. (xlvii) Kingfishers: sign of fine weather for sailing. (xlviii) Remainder of aquatic class. (xlix-li) Craftsmanship of birds in nest-making; remarkable structures of swallows: sand-martins: thistle-finch: bee-eater: partridges. (lii f.) Pigeonsremarkable structures of, and prices paid for; (liv f.) Varieties of birds' flight and walk; footless martins or swifts. (lvi) Food of birds. Goat-suckers, spoon-bill. (lvii) Intelligence of birds; gold-finch, bull-bittern, yellow wagtail. (lviii-lxl) Talking birds: parrots, acorn-pies; riot at Rome caused by talking crow. (lxi) Diomede's birds. (lxii) What animals learn nothing. (lxiii) Birds, mode of drinking; the sultana hen. (lxiv) The long-legs. (lxv f.) Food of birds. Pelicans. (lxvii f.) Foreign birds: coots, pheasants, Numidian fowl, flamingos, heath-cock, bald crow or cormorant, Tedbeaked or Alpine crow, bare-footed crow or ptarmigan. (lxix) New species: small cranes. (1xx) Fabulous birds. (1xxi) Who invented fattening of chickens, and which consuls first prohibited? who first invented aviaries? Aesop's stewpan. (lxxiii-lxxx) Reproduction of birds: oviparous creatures other than birds; kinds and properties of eggs; defective hatching and its cures; Augusta's augury from eggs; what sort of hens the best? their diseases and remedies: kinds of small heron:

nature of puff-eggs, addled eggs, wind-eggs; best way of preserving eggs. (lxxxi f.) The only species of bird that is viviparous and suckles its young. Oviparous species of land animals. Reproduction of snakes. (lxxxui-vii) Reproduction of all land animals; posture of animals in the uterus; animal species whose mode of birth is still uncertain; salamanders; species not reproduced by generation; species whose generated offspring is unfertile; sexless species. (lxxxviii-xc) Senses of animals; all have sense of touch, also taste; species with exceptional sight, smell, hearing; moles; have oysters hearing? which fishes hear most clearly? which fishes have keenest sense of smell? (xci-iii) Difference of food in animals: which live on poisonous things? which on earth? which do not die of hunger of thirst? (xciv) Variety of drink. (xcv f.) Species mutually hostile: facts as to friendship and affection between animals: instances of affection between snakes. (xcvii f.) Sleep of animals; which species sleep?Total: 794 facts, investigations and observations.

Authorities: Manilius, Cornelius Valerian, Records, Umbricius Melior, Masurius Sabinus, Antistins Labeo, Trogus, Cremutius, Marcus Varro, Aemilius Macer. Melissus. Mucianus, Nepos, Fabius Pictor, Titus Lucretius, Cornelius Celsus, Horace, Deculo, Hyginus, the Sasernae, Nigidius, Mamilius Sura. Foreign authorities: Homer, Phemonoe, Philemon, Boethus's Ornithogonia, Hylas's Auguries, Aristotle, Theophrastus, Callimachus, Aeschylus, King Hiero, King Philometor, Archytas of Tarentum, Amphilochus of Athens, Anaxipolis of Thasos, Apollodorus of Lemnos. Aristophanes of Miletus, Antigonus of Cumae, Agathocles of Chios, Apollonius of Peruamum Aristander of Athens, Bacchius of Miletus, Bion of Soli, Chaereas of Athens, Diodorus of Priene, Dion of Colophon, Democritus, Diophanes of Nicaea, Epigenes of Rhodes, Evagon of Thasos, Euphronius of Athens, Juba, Androtion On Agriculture, Aeschrio ditto, Lysimachus ditto, Dionysius's translation of Mago, Diophanes's epitome of Dionysius, Nicander, Onesicritus, Phylarchus, Hesiod.

Book 11. Subject he kinds of insects. (i) Nature's subtlety in this department. (ii) Do insects breathe? have they blood? (iii) Their bodies. (iv-xxiii) Beesstructure of their comb; its materials, gum, pitch-wax, bee-glue, bee-bread (sandarack, serintkus): flowers from which materials derived: instances of bee-lovers; drones; nature of honey; the best honey; unique local varieties of honey; test of varieties; heather (heath, sisyrus); reproduction of bees; their system of royalty; swarming sometimes actually a good omen; kinds of bees; diseases of bees; enemies of bees; beekeeping; replenishment of stock (xxiv) Wasps and hornets. What animals reproduce from another species? (xxy-viii) Assyrian silkworm: chrysalis. larva; inventor of silk fabric; silkworm of Cos; manufacture of Coan silk. (xxviii f.) Spiderswhich varieties make webs; material used in webs; mode of reproduction. (xxx ff.) Scorpions; geckoes; grasshopperstheir lack of mouth and vent. (xxxiii) Insects' wings. (xxxiv-vi) Beetles; glow-worms; other kinds of beetle: locusts: ants. (xxxvii-ix) Chrysalises, gadflies, butterflies; animals born from wood or in wood; animals of human refuse; which is the smallest animal? summer animals. (xl) Ventless animal. (xli-iii) Moths, beetles, gnats; snow animal; fire-animal (pyrallis or pyrotos); mayflies. (xliv-xcviii) Nature and account of all animals arranged according to the parts of the body: species possessing caps; crested species. (xlvi) Varieties of hornwhich species can move the horns; heads, headless species; hair; bones of head; brain; earswhich species have none, which hear without ears or apertures; face, brow, eyebrow. (lii-lvii) Eyes: what animals without eyes, what with only one eye; varieties of eyes; method of sight; species that see by night; structure of pupil; species that do not close the eyes; species whose eyes after being destroyed grow again; eyelashesspecies that lack, species with lashes on only one lid: species with no eyelids. (lviii-lx) Cheekbones; nostrils; cheeks, lips, chin, jaws. (lxi-iv) Teethkinds of; species with teeth in one jaw only; with hollow teeth; snakes' teeth, snakes' poison; which bird has teeth; remarkable facts as to teeth; age of ruminants indicated by teeth. (lxv) Tonguetongueless species; croaking of frogs; palate. (lxvi-viii) Tonsils; uvula, epiglottis, windpipe, gullet, nape, neck, backbone, throat, jaws, stomach. (lxix-lxxi) Heart, blood, life; which species has largest heart, which smallest, which two hearts; when inspection of heart of victims began; (lxxii) Lungswhich species has largest, which smallest, which no internal organ besides lungs; cause of speed in animals. (lxxiii-vi) Liverhead of internal organs; its inspection by augurs: species with two livers, and their habitats; gallwhat species have two, and where; what animals have none, which have gall elsewhere than in liver; its function; species whose gall grows and shrinks in size with moon; observation of these species by augurs, and marvellous portents. (lxxvii) Diaphragm; nature of laughter. (lxxviii) Stomach; species that have none; the only species that vomit. (lxxix) Smaller intestines, entrails, stomach, great gut; why some animals have voracious appetites. (Ixxx-iii) Caul, spleenspecies without spleen. Kidneys; habitat of species with four kidneyswith none; chest; ribs; bladderanimals without bladder; entrails; membranes. (lxxxiv-viii) Bellythe 'parts,' the womb, sows' womb, paps; what species have suet, what tallow;

have none: bones: prickles: species that have neither hones nor prickles: cartilages: sinews: species without sinews. (lxxxixxcii) Arteries, veins; species with neither veins nor arteries; blood; sweat; species whose blood thickens most quickly, whose blood does not coagulate; which species has the thickest blood, the thinnest, none at all, none at certain seasons of the vear: whether blood is dominant factor in body. (xciii f.) Back: hair and integument of back: species having hair inside mouth and under feet. (xcv-xcvii) Paps; which birds have paps; noteworthy points about animals' udders; milk; which the only animal that gives suck while in motion; biestings; cheese; species whose milk does not form cheese; curdled milk; kinds of food obtained from milk; kinds of cheese. (xcviii-cxiii) Differences in limbs between man and other animals: the fingers; arms; resemblance to monkeys; nails; knees and thighs; which parts of human body associated with ritual; dilated veins; gait, feet and legs; hooves; feet of birds; feet of animals, between 2 and 100 ; dwarfs ; genital organs; hermaphrodites; testicles; three kinds of half-man; tails; voices of animals; limbs of subsequent growth. (cxiv) Marks of vitality and character derived from conformation of limbs in man. (cxv) Respiration; nutrition; animals that from eating poison do not die, but kill those who taste them. (cxvii-ix) Causes of indigestion in man; remedies for indigestion; cause of corpulence, and mode of reduction; things whose taste allays hunger and thirst.Total: 2700 facts, investigations and

nature of each: what species have no fat: marrow: species that

observations. Authorities: Marcus Varro, Hyginus, Scrofa, Saserna, Cornelius Celsus, Aemilius Macer, Virgil, Columella, Julius Aquila's Eiruscan System, Tarquitius ditto, Umbricius Meior ditto, Cato the ex-Censor, Calvinus, Trogus, Melissus, Fabianus, Mucianus, Nigidius, Mamilius, Oppius. Foreign authorities: Aristotle, Democritus, Neoptolemus's Production of Honey, Aristomachus ditto, Philiscus ditto, Nicander, Menecrates, Dionysins's translation of Mago, Empedocles, Callimachus, King Attaius, Venomous Animals by Apollodorus, Hippocrates, Herophilus, Erasistratus, Asclepiades, Themiso, Posidonius the Stoic, Menander of Priene, Menander of Heraclea, Euphronius of Athens, Theophrastus, Hesiod, King Philometor.

Book 12. Contents: treestheir various qualities. (i, ii) In praise of trees. (iii-lxiii) Foreign trees. (iii-vi) Planewhen and whence first introduced into Italy; their nature; remarkable products; dwarf planes; who first introduced the pruning of garden trees. (vii) Assyrian apple, instructions for planting. (viii-xvii) Indian trees; ebony, when first seen at Rome; its kinds: Indian thorn: Indian fig; beautiful unnamed Indian trees; Indians' flax-trees; plantain tree, its fruit bananas; pepper trees, kinds of pepper, defective pepper, ginger, nutleaf, wolf-plant or Chiron's box-thorn, macir, sugarcane. (xviii f.) Trees of the Arian race, ditto of Gedrosia, ditto of Ilyrcania, ditto of Bactria; myrrh plant or gain-plant (malacha, maldacum); germander. Modes of adulteration, tests and prices specified for all scents or spices. (xx f.) Trees of Persia; trees of islands in Persian Gulf; cotton-tree. (xxii-iv) Cynas tree; trees used in East for making linen; locality with no deciduous trees: modes in which trees form fruits. (xxy-xxix) Costus; nard, its 12 varieties; hazelwort; amomum, amomis, cardamon. (xxx-xxxii) The incense-producing district, incense-bearing trees; nature and kinds of incense. (xxxiii-v) Myrrh: trees that produce it; nature and kinds of myrrh. (xxxvi-xl) Mastic; ladanum, scorbus, styptic, bratus tree; stobrum tree. (xli) Arabia, why happy. (xlvi-xlvii) Cinnamon, cinnamomum, cinnamon-shrub; wild cinnamon, cancamum, aloe-wood; serichatuxn, gabalium; behennut; Egyptian date. (xlviii-lxi) Scented reed, scented rush: Hammonian gum-tree: fragrant moss; cyprus; calycotome or erysisceptrum; catthyme: balsam. balsam-juice, balsam-wood sigma; galbannm; all-heal; bear's-foot: cinnamon-leaf; grape-plant; moss, vineflower, wild vine; fir or larch; cinnamon comacton. Total: 468 facts, investigations and observations.

Authorities: Marcus Varro, Mucianus, Virgil, Fabianus, Sebosus, Pomponius Mela, Flavius Procilius, Hyginus, Trogus, Claudius Caesar, Cornelius Nepos, Greek Treatise on Medicine by Sextius Niger, Cassius Hemina, Lucius Piso, Tuditanus, Antias. Foreign authorities: Theophrastus, Herodotus, Callisthenes, Isogonus, Clitarchus, Anaximenes, Duris, Nearchus, Onesicritus, Polycritus, Olympiodorus, Diognetus, Nicobulus, Anticlides, Chares of Mitylene, Menaechmus, Dorotheus of Athens, Lycus, Antaeus, Ephippus, Dinon, Adimantus, Ptolemy son of Lagus, Marsyas of Macedon, Zoilus of Macedon, Democritus, Amphilochus, Aristomachus, Alexander the Learned, Juba, Apollodorus On Scents; the physicians Heraclides, Botrys, Archedemus, Dionysius, Democedes, Euphron, Mnesides, Diagoras and Jollas; Heraclides of Tarentum, Xenocrates of Ephesus.

Book 13. Contents: On foreign trees. (i-v) Perfumeswhen invented; 12 kinds and combinations; ointments, salves, testing of perfumes; perfume as promoting luxury; when first in use at Rome. (vi-ix) Palmstheir nature; how planted; 18 kinds of fruit and noteworthy facts. (x-xii) Trees of Syria: pistachio, small fig, damson, Syrian plum; cedar; what trees carry three years' fruit at once; terebinth; sumac. (xi-xvi)

Trees of Egypt: Alexandrian fig; Cyprian fig; Carob.(xvii-xx) Persian tree; what trees produce a succession of fruit; cuci palm; Egyptian thorn; gum tree, 8 kinds; Persian gum. (xxivii) Papyrus; employment of paper; when begun; how manufactured; 9 kinds; mode of testing papers; defects of papers; paper-glue; Books of Numa. (xxviii) Trees of Ethiopia. (nix) Atlantic tree; citrus-tree ; citrus-wood tables, their merits and defects; citrus-fruit. (xxxii-iv) Lotus; trees of Cyrenaica, Christ's-thorn; pomegranate, 9 kinds, wild pomegranate. (xxxv-xlvii) Trees of Asia and Greece; helleborine, heath, seed of Cnidus or altar-plant or canine thistle or fire-foam or cnestor or mezereon; goat-plant, goatthorn goat or scorpion, tamarisk or brya, hop-hornbeam; euonymus; lion-tree; purslane; cuckoo-plant, tare; fennel; Thapsas-shrub: caper-bush or dog's bush or snake-vine: sari ha; king's thorn; tree-medick. (xlviii-lvii) Trees and bushes of the Mediterranean; of the Red Sea; of the Indian Ocean; of Cavedwellers' Seasea-weed, grasson or girdle-plant, sealettuce, plait of Isis, Graces' eyelid. Total 468 facts, investigations and observations.

Authorities: Marcus Varro, Mucianus, Virgil, Fabianus, Sebosus, Pomponius Mela, Flavius Procilius, Hyginus, Trogus, Ciaudius Caesar, Cornelius Nepos, Sextus Niger's Greek treatise On Medicine, Cassius Hemina, Lucius Piso, Tuditanus, Antias. Foreign authorities: Theophrastus, Herodotus, Callisthenes, Isogonus, Clitarchus, Anaxitnenes, Duris, Nearchus, Onesicritus, Polycritus, Olympiodorus, Diognetus, Nicobulus, Anticlides, Chares of Mitylene, Menaechmus, Dorotheus of Athens, Lycus, Antaeus, Ephippus, Dinon, Adimantus, Ptolemy son of Lagus, Marsyas of Macedon, Zoilus ditto, Democritus, Amphilochus, Aristomachus, Alexander the Learned, Juba, Apollodorus On Scents; the following medical writersHeraclides, Botrys, Archedemus, Dionysius, Democedes, Euphron, Mnesides, Diagoras, Iollas; Heraclides of Tarentnm, Xenophon of Ephesus.

Book 14. Contents: fruit-trees. (i-v) Vines, their nature; their ways of bearing; grapes, their nature and tending; 91 kinds of vines and grapes; viticulture and vineyards, noteworthy facts as to (vi-xi) Mead, its discovery; 50 wines of quality; 38 foreign vintages; Opimian wine; wine-cellars, notable facts as to: nature of wine: salt wine, 7 kinds: raisinwine, must, sweet wine, 17 kinds. (xii) Inferior wines, 3 kinds. (xiii-xvii) Wines of quality, how recently begun to be made in Italy; remarks as to wine from reign of Romulus onwards; wines used in early periods; four kinds of wine, when first established. (xviii-xxi) Wild vine, 5 uses of; what juice by nature the coldest: artificial wine 66 kinds: mead or honeywine or water-mead; vinegar-honey, (xxii-y) Remarkable wines, 12 kinds; wines not permissible to use at sacrifices; substances used to flavour mustpitch, resins. (xxvi f.) Winejars, vinegar, lees, cellars. (xxviii f.) Intoxication; drinks made from water and fruit can be as potent as wine. Total: 510 facts, investigations and observations.

Authorities: Cornelius Valerian, Virgil, Celsus, Cato the Censor, Saserna senior, Saserna junior, Scrofa, Marcus Varro, Decius Silanus, Fabius Pietor, Trogus, Hyginus, Verrius Flaccus, Graecinus, Julius Atticus, Columella, Masurius Sabinus, Fenestella, Tergilla, Maccius Plautus, Fabius Dossennus, Scaevala, Lucius Aelius, Ateius Capito, Cotta Messalinus, Lucius Piso, Pompeius Lenaens, Fabianus, Sextius Niger, Vibius Rufinus. Foreign authorities: Hesiod, Theophrastus, Aristotle, Democritus, King Hiero, King King Philometor, Archytas, Xenophon. Attalus. Amphilochus of Athens, Anaxipolis of Thasos, Apollodorus of Lemnos, Aristophanes of Miletus, Antigonus of Cumae, Agathocles of Chios, Apollonius of Pergamum, Aristander of Athens, Bacchius of Miletus, Bion of Soli, Chaereas of Athens. Chaeristus ditto, Diodorus of Priene, Dinon of Colophon, Epigenes of Rhodes, Evagon of Thasos, Euphronius of Athens, Androtion On Agriculture, Aeschrion ditto, Lysimachus ditto, Dionvsius's translation of Mago, Diophanes's Epitome of Dionysius, the medical writers Asclepiades and Erasistratus, treatises on The Making of Wine by Commiades, Aristomachus and Hicesius, Themiso on medicine, Onesicritus, King Juba.

Book 15. Contents: Fruit-bearing trees, their various natures. (i-viii) The olive treehow long was it grown only in Greece; when first introduced into Italy, Spain, Africa; oliveoil, its kinds and valuable properties; nature of the olive and olive-oil when forming; 15 kinds of olives; nature of olive-oil; cultivation of olive-trees: storing of olives: manufacture of olive-oil; 48 kinds of artificial olive-oil; the kiki-tree or croto or sill or sesamum (castor-oil tree); olive-lees. (ix-xxxiv) The varieties of fruit, their kinds and nature: pine-cones, 4 kinds: quinces, 4 kinds; sparrow-apples, 4 kinds; pomegranate, 9 kinds; peach, 7 kinds; plum, 12 kinds; the persca-trea; apple, 30 kinds; foreign applesdates and sources of introduction into Italy: most recent introduction; pears, 41 kinds; grafting of varieties, and expiation when struck by lightning; storage of fruit and grapes; figs, 29 kinds; researches as to; artificial ripening of; medlars, 3 kinds; service-berry, 4 kinds; nuts, 8 kinds; chestnuts, 18 kinds; carobs; fleshy fruits; mulberries; the arbutus; berries, varieties of; hard fruit, varieties; cherry

9 kinds; cornel-cherries; mastic-trees; juices, 13 different sorts; (xxxv-viii) the myrtle, researches as to; 11 kinds. (xxxix f.) The bay-tree, 13 kinds.Total: 520 facts, researches and observations.

Authorities: Fenestella, Fabianus, Virgil, Comelius Valerian, Celsus, Cato the Censor, the Sasernae, senior and junior, Scrofa, Marcus Varro, Decimus Silanus, Fabius Pictor, Trogus, Hyginus, Verrius Flaccus, Graecinus, Julius Atticus, Columella, Masurius Sabinns, Tergilla, Messalinus Cotta, Lucius Piso, Pompeius Lenaeus, Maccins Platens, Fabius Dossennus, Scaevola, Lucius Aelius, Ateius Capito, Sextius Niger, Vibius Rufinus. Foreign authorities: Hesiod, Theophrastus, Aristotle, Democritus, King Hiero, King Philometor, Philometor, King Attalus, Archytas, Xenophon, Ampbuloehus of Athens, Anaxipolis of Thasos, Apollodorus of Lemnos, Aristophanes of Miletus, Antigonus of Cumae, Agathocles of Chios, Apollonius of Pergamum, Aristander of Athens, Eaechius of Miletus, Bion of Soli, Chaereas of Athens, Chaeristus ditto, Diodorus of Priene, Dinon of Colophon, Epigenes of Rhodes, Evagon of Thasos, Euphronius of Athens, Androtion On Agriculture, Aeschrion ditto, Dionysius's translation of Mago, Diophanes's summary of Dionysius, Asclepiades the physician, Erasistratus ditto, Commiades On Making Wine, Aristomachus ditto, Hicesius ditto, Onesieritus, King Juba.

Book 16. Contents: forest trees, their various natures. (i f.) Races that have no trees: remarkable trees in the North. (iiixiii) Acorn-bearing trees: the civic wreath; origin of wreaths; wreath of foliage, on whom bestowed: 13 kinds of acorns: the beech; the other acorn-bearing trees; charcoal; the oak-apple; how many fruits beside the acorn borne by the same trees; catkin, cochineal-berry, larch-fungus. (xiv) Trees whose bark is utilized. (xv-xx) Roof-shingles: stone-pine, wild pine, spruce, silver, larch, pitch-pine, yew. (xxi-iii) Liquid pitch, methods of making; cedar-oil, methods of making; wax-pitch, methods of making; resin, methods of boiling; thick-pitch. (xxiv-ix) Trees of value for timber: ash, 4 kinds; lime, 2 kinds; maple, 10 kinds; growth on the maple, maple-fungus; pistachio tree; box, 3 kinds; elm, 4 kinds. (xxx f.) Nature of trees classified by habitat those that grow on mountains, on plains, on dry soils, in water, in several habitats. (xxxii) Classification. (xxxiii-viii) Non-deciduous trees: rhododendron; partially deciduous trees; regions where all trees evergreen; nature of deciduous foliage; trees whose foliage changes colour: poplars, 3 kinds; foliage that changes shape of leaf; foliage that yearly turns round; palm-leaves, cultivation and use of; remarkable foliage. (xxxix) Process of growth in trees grown from seed (xl) Non-flowering trees: the junipers. (xli-l) Conception, germination and parturition of trees; order of flowering; the husk; date of bearing of the various kinds, trees that bear yearly, three-yearly; trees that do not bear fruit; trees believed unlucky; trees that lose fruit or flower most easily; which kinds do not bear in which places; method of bearing of the various kinds; kinds that bear fruit before foliage: kinds that bear twice a year, thrice a year, (li) Which age most rapidly, which least rapidly; early ripening and late ripening fruits. (lii) Which kinds have products of more than one sort: the kernel of the box. (liii-vi) Differences of trees in trunks and boughs the lotus or date plum; boughs, bark, roots. (lvii f.) Instances of trees rising again of their own accord: spontaneous generation of trees, modes of, (lixlxi) Differences of nature not generating all kinds everywhere; places where particular kinds do not grow; cypresses; growth from the earth of entirely novel kinds a frequent occurrence. (lxii) Ivy, its 20 kinds. (lxiii) Bindweed. (lxiv-lxxi) Water plants: canes; reeds, 25 kinds; reed arrows, reed pens, reed pipes: the bird-catcher's and fisherman's reed of Orchomenus: the vine-prop reed; the alder; the willow, its kinds; other plants useful for ties: bulrushes, rush-lights, canes, thatch: elders, brambles. (lxxi f.) Sap of trees. (lxxiv-vii) Nature of timbers; wood-cutting; sizes of trees; the pine; charcoal. (lxxvii-lxxxi) Trees exempt from rotfrom splitting; researches as to durability of timbers; kinds of woodworms; wooden architecture. (lxxxii-iv) Wooden tools; gluing timber; sawn sheets of wood. (lxxxv-xc) Age of long-lived trees: tree planted by the elder Africanus; tree in Rome 500 years old; trees dating from the foundation of the city; trees in the suburbs older than the city; trees planted by Agamemnon; frees dating from first year of the Trojan War; trees at Troy shown from designation 'Ilion' to be older than the Trojan War; ditto at Argos; trees planted by Hercules; trees planted by Apollo; a tree older than Athens: what kinds of trees are least long-lived. (xci-iv) Trees celebrated for some occurrence; parasitic plants; plants parasitic on trees and able to grow in earth9 kinds of these; cadytas, hyphear, stelis, hippophaestum; nature of mistletoe and similar plants; manufacture of bird-lime.Total: 1135 facts, researches and observations.

Authorities: Marcus Varro, Fetialis, Nigidius, Cornelius Nepos, Hyginus, Masurius, Cato, Mucianus, Lucius Piso, Trogus, Calpurnius Bassus, Cremutius, Sextius Niger, Cornelius Bocchus, Vitruvius, Graccinus. Foreign authorities: Alexander the Learned, Hesiod, Theophrastus, Democritus, Homer, Timaeus the mathematician.

Book 17. Contents: the natures of cultivated trees. (i) Remarkable prices for trees. (ii-iv) Effect of climate on trees: proper aspect for vines; best soil; soil enjoyed by Greece and the Gallic provinces8 kinds. (v-viii) The use of ashes; dung; what crops enrich the soil, which impoverish it; methods of using manure. (ix-xxi) Methods of growing trees; kinds springing from seed; that never degenerate; kinds springing from settings, from a cutting, from a layer; seed-beds, transference of seed-beds: growing elms from seed: trenching: distances between trees; shade; droppings from leaves; slowgrowing and quick growing kinds; kinds springing from layers. (xxii-viii) Graftinghow discovered; kinds of grafts; eye-grafting; budding; grafting of vines; grafts growing from boughs; kinds grafted by cuttings, and method. (xxix-xxi) Olive-growing: seasonal arrangement of propagating: trenching round and banking up vines. (xxxii-iv) The willow thicket; reed bed; other plants cut for poles and stakes. (xxxv f.) Arrangement of vineyards and plantations; prevention of injury to vines from animals. (xxxvii f.) Diseases of trees; remarkable products from trees. (xxxix-xlvii) Remedies for diseases of trees; method of watering; remarkable facts as to water-meadows: use of dung: method of hoeing round trunk: lopping of trees; how to dig round trees; pruning of trees; effect of gall-insect; mistakes in pruning; medicaments for trees. Total: 1380 facts, researches and observations.

Authorities: Cornelius Nepos, Cato the censor, Marcus Varro, Celsus, Virgil, Hyginus, the Sasernae, senior and iunior. Scrofa. Calpurnius Bassus, Trogus, Aemilius Macer, Graecinus, Columella, Julius Atticus, Fabianus, Mamilius Sura, Dessius Mundus, Gaius Epidius, Lucius Piso. Foreign authorities: Hesiod, Theophrastus, Aristotle, Democritus, Theopompus, King Hiero, King Philometer, King Attalus, Arehytas, Xenophon, Amphilochus of Athens, Anaxipolis of Thasos, Apollodorus of Lemnos, Aristophanes of Miletus, Antigonus of Cumae, Agathocles of Chios, Apollonius of Pergamum, Bacchius of Miletus, Bion of Soli, Chaereas of Athens, Chaeristus ditto, Diodorus of Priene, Dinon of Colophon, Epigenes of Rhodes, Evagon of Thasos, Euphronius of Athens, Androtion On Agriculture, Aeschrion ditto, Lysimachus ditto, Dionysius's translation of Mago, Diophanes's summary of Dionysius, Aristander On Portents.

Book 18. Contents: crops, their natures, (i) Devotion to agriculture in early times. (ii) The earliest wreath at Rome; the wreath of ears of corn; (iii) The acre. (iv) Number and dates of lowest falls; price of corn. (v) Distinguished authorities on agriculture. (vi) Rules for preparing the ground. (vii) Location of homesteads. (viii) Old authorities on methods of agriculture. (ix) Kinds of grain. (x-xxix) Properties of corn according to kinds: emmer, wheat, barley, pearl-barley; barley-groats porridge, starch, common wheat, wheat-flour, two grain wheat, seed; the remaining kinds in the east modes of grinding; sesame, erysimum or irio, clary, species of millet; yeasts; bread, methods of making and kinds of; when bakers began at Rome. (xxx-xxxvi) Leguminous plants: beans. kinds of chickpea, calavance, pea; turnips, navews, lupin. (xxxvii-xliii) Fodder: vetch, pulse, fenugreek, secale or rye, mixed fodder, besil, bitter vetch; lucerne. (xliv f.) Oats; corn diseases, remedies. (xlvi) Proper crops to sow in various kinds of soil. (xliii) National differences in methods of sowing. (xlviii-l) Kinds of plough; method of ploughing; harrowing, weeding, hoeing; cross-harrowing. (li-liii) Greatest fertility of soil; method of cropping same field more than once a year; manuring. (liv-lxi) Seed-testing; amount of seed of different varieties of corn required per acre; seasons for sowing; position of stars from day to day and earthly signs as to agricultural operations. (lxii-xxiv) Agricultural operations proper to the several months; poppies; hay; causes of various kinds of Infertility; remedies; harvests, storage of corn, vintage and autumn operations. (lxxv f.) Conditions of the moon, of the winds. (lxxvii) Fixing of rounds of estates. (lxxviii-xc) Weather-forecasts: from the sun, moon, stars, thunderclouds, mists, earth-fires, waters; from the seasons themselves; from aquatic animals, from birds, from quadrupeds. Total 2060 facts, researches and observations.

Authorities: Masurius Sabinus, Cassius Hemma, Verrius Flaccus, Lucius Piso, Cornelius Celsus, Turranius Gracilis, Decimus Silanus, Marcus Varro, Cato the ex-Censor, Scrofa, the Sasernae senior and junior, Domitius Calvinus, Hyginus, Virgil, Trogus, Ovid, Graecinus, Columella, Tubero, Lucius Tarutius's Greek treatise On the Stars, Caesar the Dictator ditto, Sergius Pauilus, Sabinus Fabianus, Marcus Cicero, Calpurnius Bassus, Ateius Capito, Mamilius Sura, Accius's Praxidica. Foreign authorities: Hesiod, Theophrastus, Aristotle, Democritus, King Hiero, King Philometer, King Attains, King Archelana, Archytas, Xenophon, Amphilochus of Athens, Anaxipolis of Thasos, Apollodorus of Lemnos, Aristophanes of Miletus, Antigonus of Cumae, Agathocles of Chios, Apollonius of Pergamos, Aristander of Athens, Bacchius of Miletus, Bion of Soli, Chaereas of Athens, Chaeristus ditto, Diodorus of Priene, Dinon of Colophon, Epigenes of Rhodes, Evagon of Thasos, Euphronius of Athens, Androtion On Agriculture, Aeschrio ditto, Lysimachus ditto, Dionysius's translation of Mago, Diophanes's summary of Dionysius, Thales, Eudoxus, Philip, Calippus, Dositheus,

Parmeniscus, Meto, Crito, Oenopides, Conon, Euctemon, Harpalus, Hecataeus, Anaximander, Sosigenes, Hipparchus, Aratus, Zoroaster, Archibius.

Book 19. Contents: (i-vi) Flax, nature and remarkable properties of; 27 specially good kinds of; how grown and how made up; earliest employment of awnings in the theatre. (viiix) Esparto grass, nature of; how made up; when first used. (x) The wool-bearing bulb. (xi-xviii) Plants that spring up and live without root: plants that spring up and cannot be grown from seed: mushroom, iton, stork's bill; truffles, stalkless mushrooms; silphium plant, and its juice, leaf and stalk; madder; dyers' rocket, (xix-xxi) The charm of gardens; description of plants other than cereals and shrubs. (xxi-xxxvii) Nature and kinds and descriptions of 20 garden plants: roots, flowers, leaves of all these: deciduous garden plants; various periods of sprouting; nature of seeds; various modes of sowing; which of a single kind and which of several kinds. (xxxviii-lv) Nature and kinds and descriptions of 23 garden plants cultivated for condiments. (xlviii) Plants springing from an exudation; (lvi) Fennel-giant, 4 kinds; hemp. (lvii-lix) Diseases of garden plants; cures; modes of killing ants; modes of protecting against caterpillars, against green-fly what plants benefited by salt water. (lx) Method of watering gardens. (lxi f.) Juices and flavours of garden plants; pepperwort, rosemary, mint.Total: 1144 facts, investigations and observations.

Authorities: Maccius Plautus, Marcus Varro, Decimus Silanus, Cato the Censor, Hyginus, Virgil, Mucianus, Celsus, Columella, Calpurnius Bassus, Mamilius Sura, Sabinus Tiro, Licinius Macer, Quintus Birrius, Vibius Rufinus, Caesennius On gardening, Castritius ditto, Firmus ditto, Potitus ditto. Foreign authorities: Herodotus, Theophrastus, Democritus, Aristomachus, Menander's Things serviceable for life, Anaxilaus.

Book 20. Subject: medicines obtained from garden plants: (ii) from the wood-encumber 26, (iii) wild encumber 27; (iv) snake cucumber or wild cucumber 5, (v) garden encumber 9, (vi) pumpkin 11, (vii) gourd or somphus 1, (viii) eoloeynth 10, (ix) turnips 9, (x) wild turnip 1, (xi) navews or swede of two varieties 5, (xii C) garden radish 43, horseradish 1, (xiv) parsnip 5, marsh mallow or plistolochia or wild mallow 11. (xy) staphyhnus or wild parsnip 22. (xyi) French carrot 1. (xvii) skirwort 11, (xviii) hartwort 12, (xix) elecarnpane 11, (xx) onion 27, (xxi) cut leek (chives) 32, (xxii) headed leek 39, (xxiii) garlic 61, (xxiv) lettuce 42, goat-lettuce 4, (xxv) caesapum lettuce 1, isatis 1, wild lettuce 7, (xxvi) hawk-weed 17, (xxvii) beet 24, (xxviii) wild beet or neurois 3, (xxix) endive or wild succory 4, (xxx) chicory or worthy or championship 12. (xxxi) scented succory 4. (xxxii) endive 2 kinds, 7 medicines, (xxxiii) cabbage 87, (xxxv) sprouts, (xxxvi) wild cabbage 27, (xxxvii) charloek 1, (xxxviii) sea-cabbage 1. (xxxix) squill 23, (xl) onions 30, (xli) bulbine 1, emetic onion, (xlii f.) garden asparagus 17, wild asparagus or orminus or Libyan asparagus 24, (xliv) parsley 17, (xlv) wild parsley or bee-plant : (xlvi) olusatrum or horse-parsley 11, mountain parsley 2, beg parsley 1, (xlvii) rock parsley 1, cow-parsley 1, (xlviii) basil 35, (xlix) colewort 12, (l) cress 42, (li) rue 84, (lii) wild mint 20 (liii) mint 41, (liv) fleabane 25, (lv) wild-bane 17, (lvi) cat-mint 9, (lvii) cumin 48, wild cumin 27, (lviii) ammi 10, (lix) caper-bush 18, (lx) lovage or all-heal 4, (lxi) ox-cunila 5, (lxii) cock-cunila or marjoram 5, (lxiii) cunilago 8. (lxiv) soft cunila 3. libanotis 3. (lxv) garden cunila 3. mountain cunila 7, (lxvi) pepperwort or Indian pepper 5, (viiix) wild marjoram or horehound 6, goat's-thyme 9, Heraclean marjoram, 3 kinds, 30 drugs; (lxx) pepperwort 3, (lxxi) git or cultivated fennel 23, (xii-iv) anise or anicetum 61, dill 9, (lxxv) sacopeniuxn sagapenum 13, (lxxvi-lxxx) white poppy 3, black poppy 8 (narcotic effect, opium, prophylactics called anodynes, peptic drugs, febrifuges and purges); poppy-juice 1, wild poppy 2, wild horned poppy or glaucous or shore poppy 6, Heracles poppy or foam poppy 4 (medicinal poppy-juice), spurge poppy or a poppy 3, (lxxxi) purslane, also called peplis, (lxxxii-iv) coriander 21, orache 14, varieties of mallowmalope 13, malache 1, althaea or plistolochia 54, (lxxxy f.) wood-sorrel or oxalis or horse-sorrel or dock 1. water sorrel 2, horse-sorrel 6, bitter sorrel 4, cultivated sorrel 21, cow-sorrel 1, (lxxxvii-ix) mustard 3 kinds, 44 drugs, sedge-froth 48, horehound or prasiurn or flax-twist or ladslove or bilochares 29, (xc-xcix) wild thyme 18, wild mint or Thrynibraeum 23, flax-seed 30, blite 6, bear wort or Athanxas 7, fennel 22, horse-fennel or bay-fennel 5, hemp 9. fennel giant 8, edible thistle or cardoon 6. (c) Snakebite antidote, recipe for. Total 1606 drugs, investigations and observations.

Authorities: Cato the Censor, Marcus Varro, Pompeius Lenaeus, Gaius Valgius, Hyginus, Sextius Niger's Greek writings, Julius Bassus ditto, Celsus, Antonius Castor. Foreign authorities: Democritus, Theophrastus, Orpheus, Menander's Things serviceable for life, Pythagoras, Nicander. Medical writers: Hippocrates, Chrysippus, Diodes, Ophion, Heraclides, Hicesius, Dionysius, Apollodorus of Citium, Apollodorus of Tarentum, Praxagoras, Pleistonicus, Medius, Dieuches, Cleophantus, Philistion, Asclepias, Crateuas, Petronius Diodotus, Iollas, Erasistratus, Diagoras, Andreas, Mnesides, Epicharmus, Damion, Dalion, Sosimenes, Tlepolemus, Metrodorus, Solon, Lycus, Olympias of Thebes, Philinus, Petrichus, Miccio, Glancias, Xenocrates.

Book 21. Contents: the natures of flowers and of flowers for garlands. (ii-ix). Of wreaths; garlands; inventors of blending flowers; when first called 'floral crowns,' and why; who first bestowed crowns with silver and gold foliage; why called 'garland-gratuities'; of ribbonswho first reproduced them in carving: high value placed on crowns of honour among the ancients; simplicity of crowns among the ancients; who received a crown bestowed by the nation at Rome; plaited crowns; stitched crowns, nard-crowns, silk crowns; Queen Cleopatra's action with regard to crowns. (x-xil, lxxiii-v). Rose, 12 kinds, 32 drugs; lily, 3 kinds, 23 drugs; plant from an exudation: narcissus, 3 kinds, 16 drugs, (xiii) Flowers grown of special colours by dyeing the seed. (xiv-xxxvii) Mode of growing from cuttings, from seed, mode of cultivating various flowers, arranged under various kinds; the violet colours (lxxvi, 17 drugs); yellow herb, 5 kinds (lxxvi, 10 drugs); marsh marigold; king flower; cyclamen (17 drugs); rush (1 drug); crocus (lxxxi, 20 drugs); where the best flowers are: what flowers were in vogue in Trojan times: nature of scents; the iris (41 drugs); wild nard (3 drugs); the hulwort or teuthrium (19 drugs); flowers with different colours in the morning, at midday, and at sunset; floral patterns in dress; amaranth; the cornflower (2 drugs); the all-gold (3 drugs); the petiliuin or ox-eye daisy; the goldy-locks or gilt lady (6 drugs); which plants' flowers provide wreaths, which plants' leaves: white byrony, privet, wild marioram, mezereum or casia, 2 kinds, bee-leaf or balm (21 drugs), melilot, garland of Campama or honey-lotus (12 drugs); trefoil, 3 kinds (4 drugs) mouse bane; thyme, 3 kinds (28 drugs); plants springing from flower, not seed; elecampane; flower of Jupiter; martagon-lily (4 drugs) calamint (5 drugs); phlox; plant with scented stalk and leaves: southern-wood (22 drugs); flower of Adonis, 2 kinds; self-fertilizers; leucanthemum (1 drug); marjoram, 2 kinds (60 drugs); wake-by-night or chenamyche or see-bynight. (xxxviii f.) Time-series of birth of flowers; garland anemone or phrenion (xciv-ix 10 drugs); wine-flower grass (6 drugs); cultivated fennel (11 drugs), marigold (11 drugs), gladiolus, hyacinth (8 drugs), lychnis (7 drugs), narcissus pothos, 2 kinds, crocus, 2 kinds, periwinkle or dwarf laurel (xl, 4 drugs); evergreen grass. (xli-ix) Length of life of various flowers; what kinds among flowers should be cultivated to attract bees; waxflower; diet of bees; their diseases and remedies; poisonous honey and its remedies; honey that causes madness; honey that flies will not touch; apiaries, hives and care of hives: do bees feel hunger? manufacture of way: the best kinds of wax: Carthaginian wax. (1-cviii) Self-grown vegetation, its use among certain races, its kinds, remarkable cases of; strawberries, wild grapes, butcher's broom (c, 4 drugs); samphire, 2 kinds (ci. 11 drugs), meadow parsnip, willow-hop, culcas (cii, 2 drugs) Oretan pitch plant, anthalium or anticellium or anthyllium (ciii, 6 drugs); oetum; roots with no growth above the surface of the earth: chickling vetch, aracos; candryala, hypochoeris, caucalis, anthriscum, chervil (also called goat's beard), maiden-flower or white blossom or marjoram or partridge-plant or wall-plant (civ, 8 drugs), nightshade or strychnos or halicacabus or calitha or dorycnion or mad-plant or surplus or sinew-plant or lack-wit or moly (cv, 8 drugs), wild pulse (cvi, 6 drugs), chick-pea, acynopus, rock-plant; non-flowering plants, plants perpetually in flower; safflower, 4 kinds (cvii, 3 drugs). (livviii) Plants of the prickly kind (erynge thistle, licorice root, land caltrop, rest-harrow, pheos or stoebe, horse-beam, nettle, 4 kinds, dead-nettle, scorpion-grass, acorna or murder-thistle, whitethorn, copper-wort, safflower, many-thorn, donkey-box, helxine, edible thistle, carline thistle, tetralix heath (thorny mastix, cactus, pternica, pappum, artichoke). (lix) Plants classed by stalks: hartshorn, alkanet, chamomile, phyllanthes, crepis, lotus. (lx) Plants distinguished by leaves: evergreens; plants flowering in sections; heliotrope, whose use for drugs will be stated in the Book. (lxi-v) Ear-bearing classes: stanyops, fox-tail, stelephuros, or quail-plant or plantain, thryallis, partridge-wort, bird's milk; plants of twelve-month growth, plants flowering from top, ditto from bottom; internal-sprouting burdock, Opus-plant making root from leaf; iasione, chondrilla, year-long flowering bitter-plant. (lxvi) Plants producing flower before stalk, stalk before flowers, thrice-flowering. (ixvii-lxxi) Gladiolus, 8 drugs; eorydalis; aspbodel or royal spear-grass (asphodel-stalk or bulb): rush, 6 kinds, 4 drugs: cyperus, 4 drugs, cyperis, cypira, holoschoenos. (lxxii) Drugs from scented rush or teuehites 10. (lxxviii-lxxxii) Drugs from hazelwort 8, drugs from Gallic nard 8, drugs from 'phu' grass 4; Syrian saffron-leas, 2 drugs, (cviii) pesoluta, 1 drug. (cix) Translation of Greek terms for weights and measures. Total, 730 drugs, investigations and observations

Authorities: Cato the ex-Censor, Marcus Varro, Masurius, Antias, Caepio, Vestinus, Vibius Rufinus, Hyginus, Pomponius Mela, Pompeius Lenaeus, Cornelius Celsus, Calpurnius Bassus, Gaius Valgius, Licinius Macer, Sextius Niger's Greek treatise, Julius Bassu's ditto, Antonius Castor. Foreign authorities: Theophrastus, Democritus, Orpheus, Pythagoras, Mago, Menander's Things serviceable for life, Nicander, Homer, Hesiod, Musaeus, Sophocles, Anaxilaus. Medical writers: Mnesitheus On Wreaths, Callimachus ditto, Phardas the natural scientist, Simus, Timaristus, Hippocrates, Chrysippus, Diodes, Ophion, Heradides, Hicesius, Dionysius, Apollodorus of Citium, Apollodorus of Tarentum, Praxagoras, Plistonicus, Medius, Dieuches, Cleophantus, Philistio, Asclepias, Crateuas, Petronius Diodotus, Iollas, Frasistratus, Diagoras Andreas, Mnesides, Epicharmus, Damio, Dalio, Sosimenes, Tlepolemus, Mctrodorus, Solon, Lycus, Olympias of Thebes, Philinus, Petrichus, Miecio, Glaueias, Xenocrates.

Book 22. Contents: the importance of herbs. (i-vi) That nations use herbs because of their beauty; herbs used to dye clothes: dve made of vegetable oil, ditto; tufts of sacred grass. sacred branches and the ritual of demanding redress; wreath of grass, its rarity, its only recipients, the only centurion recipient. (vii) Drugs made from the remaining sorts of wreaths. (viii-xlv) Erynge or eryngion or hundred-heads, 30; acanos thistle, 1 sweet-root or licorice, 15; mouth-heal, 1.: caltrop, 2 kinds, 12 drugs; stoebe or pheos; horse-beam, 2 kinds, 2 drugs: nettle, 61; dead-nettle 7; scorpion-plant, 2 kinds, 1 drug; pellitory or phyllos or sciatia-plant or polygonaton, 4; helxine, 12; pellitory or maiden-herb or iron-wort (the same as pitcher-polish or astericum) 11; chamaeleon-plant or canine thistle or ulophytum or cynozo]on, 2 kinds, 12 drugs (gum mastic); hartshorn, alkanet, 14; bastard-bugloss or echis or doris, 3; donkey-lip or archebius or donkey-hoof or rhexia or euchrysa, 30: the plant whose roots make dye; chamomile or white anthemis or earth-apple. or fennel-flower, 3 kinds, 11 drugs; lotus grass, 4; lotometra, 2; heliotrope or turnsole or wartwort, 12; heliotrope or three-berry or scorpion's tail, 14; adiantum or maiden-hair or tnichomanes or many-hair or saxifrage, 2 kinds, 28 drugs, rootless stem; bitter lettuce 1, corvdalis 1; asphodel 51: orach 14: bear's breech or lad's love or black-leaf 5; hare's ear 5, cow-nettle 1; wild parsnip 9; chervil 9; southern chevnil 2; bind-weed 4; caucalis 12; bur-parsley 11; sillybus thistle; cardoon or meadow thistle 5; sow-thistle, 2 kinds, 15 drugs; chondrilla 3. (xlvi) Mushrooms: peculiarity in their mode of reproduction. (xlvii-ix) Toadstools: signs of poisonous kinds: 9 drugs obtained from these: silphium 7: assafoetida plant 39. (l-lv) Bee-glue 5, honey 16, hydromel 18; reason for influence of diet on character; mead 6 honey-must, 3; wax, 8. (lvi) Warning against doctors' mixtures. (lvii-lxxvi). Drugs from various grains: common wheat 1, wheat 11, chaff 2, emmer 1, bran 1, arinca, rye-water 2; corresponding varieties of flour; 29 drugs; pearl-barley 8; fine flour, pulse 1, paper flour 1: alica 6: millet 6: Italian millet 4: sesame 7: near-sesame 3, hellebore 3; barley 9, wild barley (Greek 'Phoenician barley') 1; pearl-barley 4; starch 8; oats 1; bread 21; bean 16; lentil 17; marsh-bean 3; elelisphacon or fragrant moss (sage) 13; chick-pea and small chickpea 23; bitter vetch 20: lupine 35: winter-cress or ervsimum (Gallic 'vela') 15: clary 6. (lxxvii-lxxx) Darnel 5. millet grass 1. oats 1. chokeweed or broom-rape 1. (lxxxi f.) Protection against maggots in vegetables. Foam from beer. Total 906 drugs, investigations and observations.

Authoritiesas in preceding book, also Chrysermus, Bratosthenes, Alcaeus.

Book 23. Contents: drugs obtained from cultivated trees: (ii-xxii) from vines 20: vine-leaves 7: tendrils 7: juice of unripe grape 14; wild vine 21; fresh grapes; varieties of stored grapes, 11 drugs; vine-shoots 1; grape-stones 6; grape-skins 8; treacle-grape 4; dried grape or raisin 14; wild raisin or stavesacre or taminia or phlegm-heal 12; claret-vine or wild vine 12; salicastrum wild vine 12; white grape or ampelos leuke or staphyle or white bryony or psilothrum or archezostis or cedrostis or madon 31; black grape or bryony or Chiron's plant or gynacanthe or apronia 35; must 15; Falernian 6, Alban 2, Surrentine 3; Setine 1, Statane 1, Signine 1; other wines 64. (xxiii-vi) observations about wines 61; what invalids to be given them, and when and how; observations on these points 91. (xxvii-xxxiii) Vinegar 28, squillvinegar 17. vinegar-honey 7, must 7, wine lees 12, vinegar lees 17, must lees 4. (xxxiv-xxxix) Olive leaves 23; olive flowers 4, olive berries 6, white olives 4, black olives 3; olive lees 21, wild olive leaves 16, oil of unripe olives 3. (x1-1) Wild olive oil 8; castor oil 16; almond oil 16; bay oil 9; myrtle oil 20; oil of dwarf myrtle or prickly myrtle (butcher's room), of cypress, of citrus, nut-oil, Cnidian oil, mastic oil, oil of behen-nut, cyprus oil and cyprus flower 6; oil of must 1: of balsam 5: of betel 5, of henbane 2, of lupine 1, of narcissus 1, of radish 5, of sesame 3, of lily-seed 1, oil of Selga 1, of Iguvium 1; of olive-honey 2, of pitch 2. (li-liii) Palm-oil 9, palm-oil of behen-nut 3, of fir 17. (liv-lxxxiii) Drugs from flower, leaves, fruit, branches, bark, sap, wood, root, ash, of the different sorts of tree; observations as to apple-trees 6, as to quinces 22, as to soapworts 1, sweet apples 6, crab apples 4, citron apples 5, pomegranates 26; lip-salve 14; pomegranate blossom 8, wild pomegranate blossom 12. (lxii-lxix) Observations on pear trees, 13, on figs 111, on wild figs 42; erineus grass 3, plums 4, peaches 2, wild plums 2; tree lichen (lxx-lxxv) Mulberries 39; lip-salve or windpipe salve or all-heal 4;

cherries 5, medlars 2, serviceberries 2, pine-cones 13, almonds 29. (lxvi-lxxix) Greek nuts 1, walnuts 24 (antidote); filberts 3, pistachios 8, chestnuts 5, caroes 5, cornel-cherry 1, arbutuses. (lxxx-lxxxiii) Bay-trees 69. myrtles 60, myrtle-berry wine 13, Prickly myrtle or ground-myrtle or butcher's broom 6. Total 1418 drugs, investigations and observations.

Authorities: Gaius Valgius, Pompeius Lenaeus, Sextins Niger's Greek writings, Julius Bassus's ditto, Antonius Castor, Marcus Varro, Cornelius Celsus, Fabianus. Foreign authorities: Theophrastus, Democritus, Orpheus, Pythagoras, Mago, Menander's Things serviceable for life, Nicander, Homer, Hesiod, Musaeus, Sophocles, Anaxilaus. Medical writers: Mnesitheus, Callimachus, Phanias's Natural Science, Timaristus, Simus, Hippocrates, Chrysippus, Diodes, Ophion, Heracides, Hicesius, Dionysius, Apollodorus of Citium, Apollodorus of Tarentum, Praxagoras, Plistonicus, Medius, Dieuches, Cleophantes, Philistion, Asclepiades, Crateuas, Petronius Diodotus, Iollas, Erasistratus, Diagoras, Andreas, Mnesides, Epieharmus, Damion, Dalion, Sosimenes, Tlepolemus, Metrodorus, Solon, Lyeus, Olympias of Thebes, Philinus, Petrichus, Miccio, Glaucias, Xenocrates.

Book 24. Contents: Drugs obtained from forest trees: (ii-ix) Egyptian water-lily 6, acorns 13, holm-oak berry 3, oakapple 23, mistletoe 11, acorns of glandiferous trees 1, Turkey oak 8, cork 2, beech 4. (x-xix) Cypress 23, cedar 13, cedarberry 10, galbanum 23, gum-tree 24, styrax gum-tree 10, bear's-foot 17, sphagnus or sphaeus or moss 5, turpentine 6, pitch-pine 8. (xx-xxix) Ground-pine 10, pityusa 6, resin 22, pitch 34, cedar-resin oil or twice-boiled pitch 16, earth-pitch 2, wax-pitch 1, pitch-pine 1, mastic-tree 22, plane 25. (xxxxxxix) Beech 5, maple 1, poplar 8, elm 16, lime 5, elder 15, juniper 21, willow 14, Amerian apple 1, chaste-tree 33, heath 1. Total 621 drugs, investigations and observations.

Authorities: Marcus Varro, Lucius Piso, Verrius Flaccus, Antias, Nigidius, Cassius Hemina, Cicero, Plautus, Celsus, Sextius Niger (Greek works of), Caecilius the medical writer, Metellus Scipio, the poet Ovid, Liciuius Macer. Foreign authorities: Palaephatus, Homer, Aristotle, Orpheus, Democritus, Anaxilaus. Medical writers: Botrys, Apollodorus, Archedemus, Aristogencs, Xenocrates, Democrates, Diodorus, Chrysippus, Philip, Orus, Nicander, Apollonius of Pitane.

30. Contents: drugs obtained from animals Book (concluded). (i-vii) Origin of magicdate and place of its commencement, by whom practised; whether carried on in Italy. Human sacrifice, when first prohibited by the senate; the Druids of the Gauls; kinds of magic; magicians' view as to moles; 5 drugs. (viii-liii) Remaining drugs, arranged according to diseases, found in animals not classed as tame or wild: cattle 2 and in last book 15 = 17, ram 7 and in last book 5 = 12, wool 25 and in last book 35 = 60, woolwashings 20 and in last book 32 = 52, mules 5 and in last book 1 = 6, horses 3 and in last book 1 = 4; dog 41 and in last book 16 = 57, mad dog 2 and in last book 3 = 5, ferret 1, mouse 28 and in last book 14 = 62 shrewmouse 1 and in last book 4 = 5, dormouse 6 and in last book 2 = 8, shrewmouse 2 and in last book 1 = 3, weasel 25 and in last book 19 = 44, newt 12 and in last book 4 = 16, hedgehog 13 and in last book 5 = 18, porcupine 2 and in last book 1 = 3, lizard 30 and in last book 13 = 43, salamander 3 and in last book 1 4, snail 19 and in last book 27 = 46 (xliii the drug everlasting), viper 3 and in last book 1 = 4, snake 6 and in last book 4 =10, viper 21 and in last book 14 = 35, serpent 27 and in last book 8 = 35, bova 3 and in last book 4 = 7, water snake 2 and in last book 1 = 3, Libyan snake 3, remaining serpents 7 and in last book 8 = 15, scorpion 2 and in last book 9 = 36, cricket 3, phryganion 1, scolopendra or multipede or millepede or centipede or woodlouse or catkin 20 and in last book 1 = 21 (admiration for nature who produces nothing useless), slug 3 and in last book 1 = 4, caterpillar 2 and in last book 1 = 3, earthworm 20 and in last book 2 = 22, treeworm 4 and in last book 1 = 5, grass-worm 8, herpes 1, tick 3; from birds, eagle 3 and in last book 4 = 7, vulture 7 and eggs 43 and in last book 22 = 65, Syrian cock 5 and in last book 4 = 9, swan 5 and in last book 1 = 6, ot is 2, raven 4 and in last book 2 = 6, crow 2 and in last book 1 = 3, hawk 2 and in last book 2 = 4, kite 6 in last book 2 = 8, crane 1, stork 1 and in last book 2 = 3, ibis 3, little heron 1, duck 4 and in last book 2 = 6, diver 2, partridge 11 and in last book 6 = 17, dove 14 and in last book 2 16, crested lark 4, cuckoo 1, Mars's woodpecker 1, turtledove 5 and in last book 4 = 9, thrush 3. blackbird 1. swallow 24 and in last book 9 = 33, night-owl 5 and in last book 4 = 9, screech-owl 1 and in last book 1 2, hoopoe 1, horned owl 5 and in last book 2 = 7, sparrow 5, galgulus 2, bat 9 and in last hook 4 13, tree cricket 1, bees 7 and in last book 5 = 12, wasps 2, cow-fly 3 and in last book 3 = 6, pine-grub 4 and in last book 2 = 6 (that the beneficence of nature has placed powerful remedies even in disgusting animals) beetle 7 and in last book 1 = 8 cockroaches 13 and in last book 4 = 17; the genus Spanish flydrugs from these 11 and in last book 5 = 16, bug 5 and in last book 9 = 14, house-fly 5 and in last book 7 = 12, locusts 3 and in last book 4 = 7, ants 5 and in last book 3 = 8. Total 854 drugs, investigations and observations.

Authorities: Marcus Varro, Nigidius, Marcus Cicero, Sextius Niger (Greek works of), Licinius Macer. Foreign authorities: Eudoxus, Aristotle, Hermippus, Homer, Apion, Orpheus, Democritus, Anaxilaus. Medical writers: Botrys, Apollodorus, Menander, Archidemus, Aristogenes, Xenocrates, Diodorus, Chrysippus, Pbilippus, Orus, Nicander, Apollonius of Pitane.

Book 31. Contents: drugs obtained from aquatic animals. (i) Remarkable facts as to waters, (ii) Differences in waters, (iiixvi) Medicinal properties: 266 observations; what sorts of waters are good for the eyes, what sorts produce fertility, what sorts cure insanity, what sorts gall-stone, what sorts wounds, what sorts protect the embryo, what sorts remove tetter, which make dye for wools, which for human beings, which produce memory, which forgetfulness, which keenness of sense, which slowness, which a musical voice, which dislike of wine, which intoxication, which fill the place of oil, which are salt and bitter; springs discharging rocks, springs that cause laughter or weeping, springs said to cure love. (xvii) Water keeping hot for three days after being drawn. (xviii-xx) Remarkable waters: waters in which all objects sink, in which no objects; waters that kill, poisonous fishes; waters that turn into stone, or produce stones. (xxi-iii) Health-giving property of waters; impurities of waters; mode of testing waters. (xxiv f.) The Marcian Spring, the Maiden Spring. (xxvi-ix) Method of finding water; signs of sprints; .differences of waters according to kinds of earth; variation of springs with the seasons. (xxx). Historical account of springs suddenly arising or stopping. (xxxi) Method of carrying water in pipes. (xxxii f.) Medicinal waters, mode of employing, for what kinds of illnesses; ditto sea-water, 29 kinds. Benefits of a voyage, 5. (xxxiv-vi) Sea-water at places inland, 1 method of producing, sea-water-honey 1, water-honey 1. (xxxvii f.) Remedy against foreign waters; 6 drugs from moss; drugs from sands. (xxxixxlv) Salt, kinds of, preparations and drugs from, 204 observations; historical importance of salt 120; froth of salt; flower of salt 20; brine 2; fish-sauce 15; pickle 15; fish-brine 8; nature of salt. (xlvi f.) Native soda, kinds of, preparations and drugs from 221 observations; sponges, 92 drugs from and observations. Total 924 drugs, investigations and observations.

Authorities: Marcus Varro, Cassius of Parma, Cicero, Mucianus, Caelius, Celsus, Trogus, Ovid, Polybius, Sornatius. Foreign authorities: Callimachus, Ctesias, Eudicus, Theophrastus, Eudoxus, Theopompus, Polyclitus, Juba, Lycus, Apion, Epigenes, Pelops, Apelles, Democritus, Thrasyllus, Nicander, comedies of Menander, Attalus, Sallustius, Dionysius, Andreas, Niceratus, Hippocrates, Anaxilaus.

Book 32. Contentsdrugs from aquatic animals. (i-iv) Nature's supreme force in antipathy. The sucking-fish, 2 cases; the electric ray, 7 cases; the sea-hare, 5 cases; marvels of the Red Sea. (v-ix) Intellect of fishes; remarkable properties of fishes; places where oracles are given from fishes, where fishes eat out of the hand, where they recognize the voice, where they are bitter, where salt, where sweet, where not dumb: Their sympathy and also antipathy for localities. (x) Sea-fish when first used by the Roman nation. King Numa's regulation as to fish. (xi) Coral, drugs from and observations as to, 66. (xii) Discord between marine animals: sting-ray 9, dog-fish, mullet 15. (xiii-xx) Amphibious animals: beavercastors, drugs from and observations as to, 56; tortoise, drugs and observations 66; gilt-bream 4, star-fish 7, sea-snake 3, salt fish 25, sardines 1, tunnies, sea-frog 6, river-frog 52, bramble-toad; observations about them 32; water-snake 6, river-crabs 14, sea-crabs 7, river-snails 7, crow-fish 4, pig-fish 2, sea-calf 10, lamprey 1, sea-horse 9, sea-urchins 11. (xxi-xxx) Shellfish: kinds, observations and drugs 1; purple dye 9; seaweed 2, sea-mouse 2, sea-scorpion 12, leeches 6, purplefishes 13, mussels 5, fishes' fat 2, callyonymi 3, crow-fish's gall 1, cuttle-fish 24, huso sturgeon 5, batia 1, bacchus or myxon 2, sea-lice 2, sea-bitch 4, seal 1, dolphin 9, sea-snail or murex 3, sea-foam 7, tunny 5, maena 13, scolopendra 2, lizard 1, conchis 1, sheat-flsh 15, sea-snail or longniussel 6, sponge 5. (xxxi-lii) Sea-cabbage 1, myax mussel 25, sea-mussels 8, giant mussels 1, seriphus fish 2, sea-mullet 2, sole-fish 1, turbot 1, blendia 1, sea-nettle 7, sea-lung 6, scallops 4; from the watersnake 4, from the water-serpent 1, mullet 1, from the young tunny 4, grayling 1, perch 4, from the skate 3, zmarides 3, conger 1, beaver 4, moss 1, haddock 1, phager 1, from the whale 1, polypus 1, shad 1, blue-fish I, rudd 1, sea-grape 1, eel 1 river-horse 1 crocodile 1 adarca or sea-foam 3 rush 8 (liii) Names of all animals living in the sea 176. Total: 990 drugs, investigations and observations.

Authorities: Licinius Macer, Trebius Niger, Sextius Niger (Greek writings of), the poet Ovid, Cassius Hemina, Maecenas, Iacchus, Sornatius. Foreign authorities: Juba, Andreas, Salpes, Apion, Pelops, Apelles, Thrasyllus, Nicander.

Book 33. Contents: the properties of the metals. (ii-xii) Gold, what first caused it to be valued; origin of gold rings; limited amount of gold among the ancients; the equestrian order, its right of wearing gold rings; its panels of judges; how often the title 'equestrian order' altered; gold and silver military gifts; gold wreath. When first bestowed; other uses of gold, its use by women. (xiii-xxv) Gold coinage; date of earliest coins, copper, silver, gold; method of using copper before introduction of stamping; highest money rating at first census; how often and at what dates value of copper and stamped coinage raised; the lust for gold; largest owners of silver and gold; date of earliest employment of silver ornaments in the arena, and on the stage; dates of largest accumulations of gold and silver in the national treasury; date of earliest gilded ceilings; reasons for special value of gold; method of gilding; discovery of gold; orpiment; synthetic amber; earliest gold statues; 8 drugs from gold. (xxvi-ix) malachite, method of employing it in painting; 7 drugs from malachite; goldsmith's malachite or mountain-green. (xxx) Remarkable natural facts as to the welding of metals and as to metal manufactures. (xxxi-v) Silver; quicksilver; antimony or stibis or alabaster or larbasis or platvopathalmus, drugs made of, 7; silver slag, drugs made of, 6; foam of silver, drugs made of, 7. (xxxvi-xli) Minimum, reverence for among the ancients; discovery and source of; cinnabar, method of using in medicine and in painting; kinds of red-lead; method of use in medicine and painting; watersilver. (xliii f.) Gilding of silver; touchstones for gold. (xliv-ly) Silver, its kinds and methods of testing; mirrors; Egyptian silver; immoderate wealth; who were the richest people; when did the Roman nation begin to squander money; luxury in silver vessels sparing use of silver in antiquity, instances of; date of earliest use of silver inlay on couches, of silver vessels of excessive size, of trays inlayed with silver, of making drums; excessive prices for silver; silver statuary ; famous works of art and artists in silver. (lvi-lviii) Of yellow ochre, who first used for painting and how. Steel blue; drugs made from, 2. Total 288 drugs, investigations and observations.

Authorities: the Emperor Domitian, Junius Gracchanus, Lucius Piso, Marcus Varro, Corviuus, Pomponius Atticus, Licinius Calvus, Cornelius Nepos, Mneianus, Boeehus, Fetialis, Fenestella, Valerius Maximus, Julius Bassus, Greek medical writings of, Sextius Niger, ditto. Foreign authorities: Theophrastus, Democritus, Juba, the historian Timaeus's Mineral Drugs, Heraclides, Andreas, Diagoras, Botrys, Archedemus, Dionysius, Aristogenes, Demodes, Mnesides, Attaius the medical writer, Xenocrates ditto, Theomnestus Nymphodorus, Iollas, Apohlodorus, Pasiteles's Masterpieces, Antigonus On Graving, Menaechmus ditto, Xenocrates ditto, Duris ditto, Menander On Gravers, Heliodorus's Votive Offerings of Athens, Metrodorus of Scepsis.

Book 34. Contents: (i) Copper metals. (ii-x) Kinds of copper--Corinthian, Delian, Aeginetan. On bronze diningcouches; on candelabra; on temple decorations of bronze; first bronze image of a god made at Rome: on the origin of statues and the reverence paid to them. (x-xix) Statues, their kinds and shapes. Ancient statues dressed in toga without tunic; the first statues at Rome, the first erected by the state, the first erected on a column; ship's beaks, when added; first foreigners to whom statues erected by the state at Rome; first women to whom statues so erected: first equestrian statue erected by the state at Rome; date of removal from public places of all statues erected by private donors; first statue publicly erected by foreigners; existence of sculptors from early times even in Italy; excessive prices for statues; the most celebrated colossal statues in the city; 366 famous instances of bronze statues and sculptors in bronze. (xx-xxix) Different kinds of bronze and alloy; gold-bronze, Capuan bronze; preservation of bronze; cadmia, 15 drugs made from; melted bronze, 10 medicinal products of; copper slag, copper blisters, copper scales, copper flakes, 47 drugs from these; copper rust, 18 drugs from; eye-salve; worm-eaten bronze, 18 drugs from; copper ore, 7 drugs from; itch-salve, (xxx-xxxviii) Ink-stone, 3 drugs from; copperas, 14 drugs from; copperas water or shoemaker's blacking, 16 drugs from; pompholyx, slag, 6 drugs from these; slag-ashes, 15 kinds; skin-detergent; diphryx; the Servilian family's magic sixpence. (xxxix-xlvi) Iron mines; iron statues; chased iron; different kinds of iron; live iron; the tempering of iron; remedies for rust; 7 drugs from iron; 14 drugs from rust; 17 drugs from iron scale; wet plaster. (xlviilvi) Lead mines: white lead: silverlead, stannum, black lead: 15 drugs from lead: 15 drugs from lead slag: dross from lead: inolybdaena, 15 drugs from; sugar of lead or cerussa, 6 dmgs from; sandaraeh, 11 drugs from; arsenic.Total, 257 drugs, including remedies for dog-bite, for the head, fox-mange, eyes, ears, nostrils, ailments of the mouth, leprosy, gums, teeth, uvula, phlegm, throat, tonsils, quinsy, cough, vomiting, chest, stomaoh, asthma, pains in the side, spleen, stomach, straining, dysentery, the seat, the private parts, blood-stanching, gout, dropsy, ulcers, 26 wounds, pus, bones, whitlows, erysipelas, haemorrhoids, ulcers, callus, pimples, mange, scars, infants, ailments of women, depilatory, sex restraint, for the voice, against attacks of frenzy. Total, 915 facts, investigations and observations

Authorities: Lucius Piso, Antias, Verrius, Marcus Varro, Cornelius Nepos, Rufus Messala, the poet Marsus, Bocchus, Julius Bassus's Greek treatise on medicine, Sextius Niger's ditto, Fabius Vestalis. Foreign authorities: Democritus, Metrodorns of Scepsis, Menaechnus's Art of Graving, Xenocrates ditto, Antigonus ditto, Duris ditto, Heliodorus's Votive Offerings of Athens, Pasiteles's Miasterpieces, Timaeus's Mineral Drugs, Nymphodorus, Iollas, Apollodorus, Andreas, Heraclides, Diagoras, Botrys, Archedemus, Dionysius, Aristogenes, Democles, Mnesides, Xenocrates son of Zeno, Theomnestus.

Book 35. Contents: (i-x) Praise of painting. Praise of sculpture. Shields with sculptured figures, when first instituted; when first set up in public; when in private houses. The commencement of painting; pictures in monochrome; the first painters. Antiquity of paintings in Italy. Roman painters. Paintingwhen first esteemed at Rome, and for what reasons, who first exhibited paintings of their victories. Foreign pictures, when first valued at Rome. (xi) Method of painting. (xii-xxx) Non-mineral pigments. Artificial colours; red ochre. 11 drugs from it; red chalk; Lemnian earth, 9 drugs from it; Egyptian earth: vellow ochre: 3 drugs from red ochre: gold size; Paraetonium white; Melian white; 6 drugs from it; burnt white-lead; earth of Eretria, 6 drugs from it; sandarach; vermilion; Syrian; black ink; dark purple ink; indigo, 4 drugs from it; ultramarine, 1 drug from it; Appian green; signetring white. (xxxi-iii) Colours that cannot be painted on a damp surface. Colours used by painters of early dates. When battles of gladiators were first painted and exhibited. (xxxivxli) The antiquity of painting; 405 celebrated cases of paintings and artists; earliest painting competition; painters that used the brush; how to check the song of birds; what painters used encaustic or waxes or graver or brush; inventors of successive improvements in painting the most difficult thing in painting: kinds of painting: first painter of panelled ceilings; vaulted roofs, when first painted; remarkable prices for pictures; the talent. (xliii-xlvi) The first discoveries of modelling; who first took a mould of a face; 14 celebrated cases of artists in modelling; works in pottery; Segni plaster. (xlvii-lix) Varieties of earth: Pozzuoli dust and other kinds of

earth used for concrete; walls cast in moulds; brickwork and employment of brick; brimstone and its kinds; 14 drugs; bitumen and its kinds; 27 drugs; alum and its kinds; 38 drugs therefrom; Samian earth; 3 drugs therefrom; Eretrian earth, its kinds; on washing earth to make a drug; Chian earth; 3 drugs therefrom; earth of Selinunte; 3 drugs therefrom; potters' clay; 9 drugs therefrom; vine-earth; 4 drugs therefrom; chalks for use in connexion with clothes; earth of Kimolo; 9 drugs therefrom; earth of Sardis, of Umbria, rock; rotten-stone; what people and whose freedmen are excessively powerful; Galatian earth, Kalibian earth, Balearic earth, Iviza earth; 4 drugs from these.Total 956 drugs, investigations and observations.

Authorities: the orator Messala, Messala senior, Fenestella. Atticus, Marcus Varro, Verrius, Cornelius Nepos, Deculo, Mucianus, Melissus, Vitruvius, Cassius Severus, Longulanus, Fabius Vestalis On Painting. Foreign authorities; Pasiteles, Apelles, Melanthius, Asclepiodorus, Euphranor, Parrhasius, Heliodorus's Votive offerings of Athens, Metrodorus's Science of Architecture, Democritus, Theophrastus, the philologist Apion's Mineral Drugs, Nymphodorus, Iollas, Apollodorus, Andreas, Heraclides, Diagoras, Botrys, Archedemus, Dionysius, Aristogenes, Democles, Mnesides, Xenocrates son of Zeno, Theomnestus.

Book 36. Contents: the natures of stones. (i-xi) Luxury in use of marbles; first owner of foreign marble pillars at Rome; first exhibitor of marble in public works; first distinguished sculptors in marble, and their dates: (ix the Mausoleum of Caria); 225 famous works and artists in marble; date of first employment of marbles in buildings; what people first cut marbles, and at what date; who first used marble wallpanelling at Rome; at which periods did the various marbles come into use at Rome; method of cutting marble; sands employed in marble-cutting; Naxian marble, Armenian marble, marbles of Alexandria, (xii f.) Onvx, alabaster: 6 drugs therefrom; Parian marble, coral marble, Alabanda stone, Theban stone, Syene granite. (xiv f.) Obelisks: obelisk in Campus Martius serving as gnomon. (xvi-xxiii) Remarkable structures in various countries; Egyptian Sphinx, pyramids; Pharos lighthouse; labyrinths; hanging gardens, hanging town: temple of Diana at Ephesus: remarkable facts as to other temples: runaway stone: sevenfold echo: buildings constructed without clamps. (xxiv) Eighteen remarkable works at Rome. (xxv-xxx) Magnetic stone: 3 drugs therefrom; Syros stone; flesh-eating or Assos stone, 10 drugs therefrom; Chermtes marble; tufa; bone-stones, palm-branch stones, Taenarus stones, Cora stones, black marbles; millstones; pyritis 7 drugs therefrom (xxxi-xl) Oyster-shell stone 4 drugs therefrom; asbestos, 2 drugs therefrom; earthstone, 3 drugs therefrom; honey-stone; 6 drugs therefrom; jet, 6 drugs therefrom; sponge-stone, 2 drugs therefrom; Phrygian stone; bloodstone, 5 drugs therefrom; schistose, 7 drugs therefrom; androdarnas bloodstone, 3 drugs therefrom; Arabian stone; minium bloodstone or liverstone, anthracite: eagle-stone, Taphiusian stone callimus: Samos stone 8 drugs therefrom (xli-l) Arab stone; 6 drugs therefrom; pumicestone, 9 drugs therefrom; medicinal and other mortars; Etesius stone, hailstone stone; Siphnos stone; soft stones; muscovy-stone; selenite; whetstones; tufas; flints, nature of; other building stones. (li-lix) Kinds of building; cisterns; lime; kinds of sand; mixtures of sand and lime; faults in building; stuccos; pillars; kinds of pillars; 5 drugs from chalk; lime-cement; white lime plaster. (lx-lxx) Pavements: the Tesselated Hall; first pavement at Rome; terrace pavements; pavements in the Greek mode; date of first mosaic pavement; date of first glass ceilings; origin of glass; its kinds and mode of manufacture; obsidian panes: remarkable uses of fire: 3 drugs from fire and ash; marvels of the hearth.Total: 89 drugs from these materials, 3 for serpents, animals' bites, for poisons, for the head, eyes, eyelid sores, teeth, tooth-powders, throat, scrofula, stomach, liver, phlegm, testicles, bladder, stone, tumours, piles, gout, remedy for bleeding, for vomiting blood, dislocation, eases of insanity, of lethargy, of epilepsy, of melancholy, of giddiness, ulcers, caustic and surgical treatment of wounds, sprains, bruises, moles burns, consumption, the breasts, diseases of women, carbuncles, plague.Full total: 434 facts, investigations and observations.

Authorities: Marcus Varro, Gaius Galba, Cincius, Mucianus, Cornelius Nepos, Lucius Piso, Quintus Tubero, Fabius Vestalis, Annius Fetialis, Fabianus, Seneca, Cato the Censor, Vitruvius. Foreign authorities: Theophrastus, Pasiteles, King Juba, Nicander, Sotaeus, Sudines, Alexander the Learned, Apion Plistonicus, Duris, Herodotus, Euhemerus, Aristagoras, Dionysius, Artemidorus, Butoridas, Antisthenes, Demetrius, Demoteles, Lyceas.

Book 37. Contents: (i-x) Origin of gems: the tyrant Polycrates's jewel; Pyrrhus's jewel; the best engravers; famous specimens of engraving; the first collection of signet-rings at Rome; jewels carried in the triumph of Pompey the Great; murrine vases, date of first importation; extravagance connected with; their nature; nature of rock-crystal, drug from it; extravagance in use of rock crystal. (xi-xx) Amber; erroneous statements about; kinds of amber, drugs from these; tourmaline, 2 drugs; diamond or ananeite, 6 kinds of

diamonds, 2 drugs; emeralds, 12 kinds, their blemishes; the gem tanos; malachite; beryls, their 8 kinds, their blemishes. (xxi-xxx) Opals, their 7 kinds, their blemishes, tests of opals; sardonyx, its kinds, its blemishes; onyx, its kinds; carbuneles, their 12 kinds, their blemishes and tests; coal-carbuncle; sandastros or Garamantitis or sandacitis; sandaresus; lychnis, its 4 kinds; Carthaginian stone. (xxxi-xl) Carnelian, its 5 kinds; chrysolite, its 2 kinds; turquoise; leek-green stone, its 3 kinds; Nile-stone; malachite; jasper, its 4 kinds, their blemishes; lapis lazuli, its kinds; sapphire; amethyst, its 4 kinds; socondion, sapenos, pharanitis, Venus's eyelid or lovereturned or lad's-love. (xli-l) Hyacinth; chrysolite, its 7 kinds; golden-amber; chrysolite, its 4 kinds; golden ehrysolite; xuthis; lad's-love or sangenos or tenites; eat's-eye; adularia, astriotes. astolon. (li-lx) St. John's bread. its 4 kinds; baetvlos; rainbow-stone; holy-stone; agates, their kinds; crystalline quartz, drugs therefrom; alabaster-stone, drugs therefrom; cock-stones, androdamas, silverstone, charm-coral, chalcedony, scented amber, asbestos-stone, aspisatis, atizoe, silverstone, turquoise, amphidanes or chrysocolla, Aphrodisiaca, apsyctos, little-gypsy; acorn-stone, frog-stone, taptes, cat's eye, helus, baroptenus or baripe, grape-stone, lock-of-hair-stone, cow'sheart, thunder-stone, boloe, cadmitis, turquoise, smoke-stone, Cappadocian stone, turquoise-stone, catochitis, catoptritis, cepitis or cepolatitis, brick-stone, cinaedias (kinds of), waxstone, top-stone, hair-stone, coral-agate, coral-stone, crateritis, crocallis, cvitis, brazen-voice, swallow-stones, tortoise-stones, tortoise-shell-stone, greenstone, Choaspesstone, gold-gleam, golden-topaz, cepionides, Daphne-stone, diadochos, diphyes, Dionysus-stone, snake-stone, heart-stone or enariste, enorchis, exhebenus, erythallis, erotylos or amphicomos or stone of remembrance, eumeces, eumithres, eupetalos, eureos, Eurotas-stone, eusebes, epimelas; milkstone, milky-stone or white-earth-stone or white graphite or cloud-stone, Galician-stone, gassinades, Gorgon-stone, goniaea, striped-jasper, tongue-stone. Vulcan-stone Mercury's privates, sixty-colonr-stone, hawk-stone, hammitis, ammonite, hormiscion, hyenastone, menion bloodstone or yellow-stone. (lxi-lx) Ida's fingers, ieterias, Jove-stone or dewstone, Indian stone, violet-stone, scale-stone, Lesbian stone, white-eve, white-spot, myrrh-colour, emerald, Lipari-stone, lysimachos, white gold, Memnonstone, Persian stone, poppystone, mithrnx, morochthos, mormorion or promnium or Alexandria stone, myrrh-stone, wart-stone, myrrh-stone, white-centre, black-centre, stone of Nasamon, fawn-stone, Nipparena, egg-stone, rain-stone or storm-stone, ass's-heart, mountain-stone or star-stone, hornstone or chalcedony, ovster-stone ophicardelos obsidian all-colours all-seeds love-all or all-love. Black Sea stone, 4 kinds, flame-stone or gold-stone, purple-stone, sea-weed-stone, white-ring, Paeanite or gaeanita, sun-stone, green-stone, Samotliracian stone, lizard-stone, flesh-stone, moon-stone, iron-stone, variegated iron-stone, sponge-stone, bream-stone, Syrtian stone, reed-stone, tricolor, thelyrrizos, thelycardios or mucul, Thracian-stone (3 kinds), ash-stone, tecolithos, love-locks, Veii-stone, zathene, zmilampis, zoraniscaea. (lxxi-lxxvii) Liver-stone, soapstone, Adad's-kidney, Adad's-eye, Adad'sfinger, three-eyed-stone, crab-stone, adder-stone, scorpionstone, wrasse-stone, triglitis, goat's-eye, sow's-eye, cranewolf's-eve. stone, eagle-stone, ant-stone, beetle-stone, peacock-stone, timiclonia; gold-sand-stone, millet-stone, oakstone, ivy stone, narcissus-stone, bean-stone, pyren, purplestone, hail-stone, pyritis, striped-stone, lightning-stone, flame-stone, coal-stone, enygros, hairy-stone, lion-stone, leopard-stone, dew-stone, honey-colour-stone, honey-yellowstone, greystone, spartopolia, rose-stone, honey-stone, copper-stone, fig-stone, ringlet-stone, ivory-marble, anancitis, synochitis, tree-stone, snail-shell. Shape of precious stones; method of testing; natural properties compared in various countries; products compared in respect of price. Total, 1300 facts, investigations and observations.

Authorities: Marcus Varro, Records of Triumphs, Maecenas, Iacchus, Cornelius Bocchus. Foreign authorities: King Juba, Xenocrates son of Zeno, Sudines, Aeschylus, Philoxenus, Euripides, Nicander, Satyrus, Theophrastus, Chares, Philemon, Demostratus, Zenothemis, Metrodorus, Sotacus, Pytheas, Timaeus of Sicily, Nicias, Theochrestus, Asaruba, Mnaseas, Theomenes, Ctesias, Mithridates, Sophocles, King Archelaus, Callistratus, Democritus, Ismenias, Olympicus, Alexander the Learned, Apion, Orus, Zoroaster, Zachalias.

NATURAL HISTORY BOOK 2

1. The world and thiswhatever other name men have chosen to designate the sky whose vaulted roof encircles the universe, is fitly believed to be a deity, eternal, immeasurable, a being that never began to exist and never will perish. What is outside it does not concern men to explore and is not within the grasp of the human mind to guess. It is sacred, eternal, immeasurable, wholly within the whole, nay rather itself the whole, finite and resembling the infinite certain of all things and resembling the uncertain, holding in its embrace all things that are without and within, at once the work of nature and nature herself.

That certain persons have studied, and have dared to publish, its dimensions, is mere madness; and again that others, taking or receiving occasion from the former, have taught the existence of a countless number of worlds, involving the belief in as many systems of nature, or, if a single nature embraces all the worlds, nevertheless the same number of suns, moons and other immeasurable and innumerable heavenly bodies, as already in a single world; just as if owing to our craving for some End the same problem would not always encounter us at the termination of this process of thought, or as if, assuming it possible to attribute this infinity of nature to the artificer of the universe, that same property would not he easier to understand in a single world, especially one that is so vast a structure. It is madness, downright madness, to go out of that world, and to investigate what lies outside it just as if the whole of what is within it were already clearly known; as though, forsooth, the measure of anything could be taken by him that knows not the measure of himself, or as if the mind of man could see things that the world itself does not contain.

2. Its shape has the rounded appearance of a perfect sphere. This is shown first of all by the name of 'orb' which is bestowed upon it by the general consent of mankind. It is also shown by the evidence of the facts: not only does such a figure in all its parts converge upon itself; not only must it sustain itself, enclosing and holding itself together without the need of any fastenings, and without experiencing an end or a beginning at any part of itself; not only is that shape the one best fitted for the motion with which, as will shortly appear, it must repeatedly revolve, but our eyesight also confirms this belief, because the firmament presents the aspect of a concave hemisphere equidistant in every direction, which would be impossible in the case of any other figure.

3. The world thus shaped then is not at rest but eternally revolves with indescribable velocity, each revolution occupying the space of 24 hours: the rising and setting of the sun have left this not doubtful. Whether the sound of this vast mass whirling in unceasing rotation is of enormous volume and consequently beyond the capacity of our ears to perceive, for my own part I cannot easily sayany more in fact than whether this is true of the tinkling of the stars that travel round with it, revolving in their own orbits; or whether it emits a sweet harmonious music that is beyond belief charming. To us who live within it the world glides silently alike by day and night. Stamped upon it are countless figures of animals and objects of all kindsit is not the case, as has been stated by very famous authors, that its structure has an even surface of unbroken smoothness like that which we observe in birds' eggs: this is proved by the evidence of the facts, since from seeds of all these objects, falling from the sky in countless numbers, particularly in the sea, and usually mixed together, monstrous shapes are generated; and also by the testimony of sightin one place the figure of a bear, in another of a bull, in another a wain, in another a letter of the alphabet, the middle of the circle across the pole being more radiant.

For my own part I am also influenced by the agreement of the nations. The Greeks have designated the world by a word that means 'ornament,' and we have given it the name of mundus because of its perfect finish and grace! As for our word caelum, it undoubtedly has the signification 'engraved,' as is explained by Marcus Varro. Further assistance is contributed by its orderly structure, the circle called the Zodiac being marked out into the likenesses of twelve animals; and also by the uniform regularity in so many centuries of the sun's progress through these signs.

4. As regards the elements also I observe that they are accepted as being four in number: topmost the element of fire, source of yonder eyes of all those blazing stars; next the vapour which the Greeks and our own nation call by the same name, airthis is the principle of life, and penetrates all the universe and is intertwined with the whole; suspended by its force in the centre of space is poised the earth, and with it the fourth element, that of the waters. Thus the mutual embrace of the unlike results in an interlacing, the light substances being prevented by the heavy ones from flying up, while on the contrary the heavy substances are held from crashing down by the upward tendency of the light ones. In this way owing to an equal urge in opposite directions the elements remain stationary, each in its own place, bound together by the unresting revolution of the world itself; and with this always running back to its starting-point, the earth is the lowest and central object in the whole, and stavs suspended at the pivot of the universe and also balancing the bodies to which its suspension is due; thus being alone motionless with the universe revolving round her she both hangs attached to them all and at the same time is that on which they all rest. Upheld by the same vapour between earth and heaven, at definite spaces apart, hang the seven stars which owing to their motion we call 'planets,' although no stars wander less than they do. In the midst of these moves the sun, whose magnitude and power are the greatest, and who is the ruler not only of the seasons and of the lands; but even of the stars themselves and of the heaven. Taking into account all that he effects, we must believe him to be the soul, or more precisely

the mind, of the whole world, the supreme ruling principle and divinity of nature. He furnishes the world with light and removes darkness, he obscures and he illumines the rest of the stars, he regulates in accord with nature's precedent the changes of the seasons and the continuous rebirth of the year, he dissipates the gloom of heaven and even calms the stormclouds of the mind of man, he lends his light to the rest of the stars also; he is glorious and pre-eminent, all-seeing and even all-hearingthis I observe that Homer the prince of literature held to be true in the case of the sun alone.

5. For this reason I deem it a mark of human weakness to seek to discover the shape and form of God. Whoever God isprovided there is a Godand in whatever region he is, he consists wholly of sense, sight and hearing, wholly of soul, wholly of mind. wholly of himself. To believe in gods without number, and gods corresponding to men's vices as well as to their virtues, like the Goddesses of Modesty, Concord, Intelligence, Hope, Honour, Mercy and Faithor else, as Democritus held, only two, Punishment and Reward, reaches an even greater height of folly. Frail, toiling mortality, remembering its own weakness, has divided such deities into groups, so as to worship in sections, each the deity he is most in need of. Consequently different races have different names for the deities, and we find countless deities in the same races, even those of the lower world being classified into groups, and diseases and also many forms of plague, in our nervous anxiety to get them placated. Because of this there is actually a Temple of Fever consecrated by the nation on the Palatine Hill, and one of Bereavement at the Temple of the Household Deities, and an Altar of Misfortune on the Esquiline. For this reason we can infer a larger population of celestials than of human beings, as individuals also make an equal number of gods on their own, by adopting their own private Junos and Genii; while certain nations have animals, even some loathsome ones, for gods, and many things still more disgraceful to tell ofswearing by rotten articles of food and other things of that sort. To believe even in marriages taking place between gods, without anybody all through the long ages of time being born as a result of them, and that some are always old and grey, others youths and boys, and gods with dusky complexions, winged, lame, born from eggs, living and dving on alternate daysthis almost ranks with the mad fancies of children; but it passes all bounds of shamelessness to invent acts of adultery taking place between the gods themselves, followed by altercation and enmity, and the existence of deities of theft and of crime. For mortal to aid mortalthis is god; and this is the road to eternal glory: by this road went our Roman chieftains, by this road now proceeds with heavenward step, escorted by his children, the greatest ruler of all time, His Majesty Vespasian, coming to the succour of an exhausted world. To enrol such men among the deities is the most ancient method of paying them gratitude for their benefactions. In fact the names of the other gods, and also of the stars that I have mentioned above, originated from the services of men: at all events who would not admit that it is the interpretation of men's characters that prompts them to call each other Jupiter or Mercury or other names, and that originates the nomenclature of heaven? That that supreme being, whatever it be, pays heed to man's affairs is a ridiculous notion. Can we believe that it would not be defiled by so gloomy and so multifarious a duty? Can we doubt it? It is scarcely pertinent to determine which is more profitable for the human race, when some men pay no regard to the gods at all and the regard paid by others is of a shameful nature: they serve as the lackeys of foreign ritual, and they carry gods on their fingers; also they pass sentence of punishment upon the monsters they worship, and devise elaborate viands for them; they subject themselves to awful tyrannies, so as to find no repose even in sleep; they do not decide on marriage or having a family or indeed anything else except by the command of sacrifices; others cheat in the very Capitol and swear false oaths by Jupiter who wields the thunderboltsand these indeed make a profit out of their crimes, whereas the others are penalized by their religious observances.

Nevertheless mortality has rendered our guesses about God even more obscure by inventing for itself a deity intermediate between these two conceptions. Everywhere in the whole world at every hour by all men's voices Fortune alone is invoked and named, alone accused, alone impeached, alone pondered, alone applauded, alone rebuked and visited with reproaches; deemed volatile and indeed by most men blind as well, wayward, inconstant, uncertain, fickle in her favours and favouring the unworthy. To her is debited all that is spent and credited all that is received, she alone fills both pages in the whole of mortals' account; and we are so much at the mercy of chance that Chance herself, by whom God is proved uncertain, takes the place of God. Another set of people banishes fortune also, and attributes events to its star and to the laws of birth, holding that for all men that ever are to be God's decree has been enacted once for all, while for the rest of time leisure has been vouchsafed to Him. This belief begins to take root, and the learned and unlearned mob alike go marching on towards it at the double: witness the warnings drawn from lightning, the forecasts made by oracles, the

prophecies of augurs, and even inconsiderable triflesa sneeze, a stumblecounted as omens. His late Majesty put abroad a story that on the day on which he was almost overthrown by a mutiny in the army he had put his left boot on the wrong foot. This series of instances entangles unforeseeing mortality, so that among these things but one thing is in the least certain that nothing certain exists, and that nothing is more pitiable, or more presumptuous, than man! inasmuch as with the rest of living creatures their sole anxiety is for the means of life, in which nature's bounty of itself suffices, the one blessing indeed that is actually preferable to every other being the fact that they do not think about glory, money, ambition, and above all death.

But it agrees with life's experience to believe that in these matters the gods exercise an interest in human affairs; and that punishment for wickedness, though sometimes tardy, as God is occupied in so vast a mass of things, yet is never frustrated; and that man was not born God's next of kin for the purpose of approximating to the beasts in vileness. But the chief consolations for nature's imperfection in the case of man are that not even for God are all things possible for he cannot, even if he wishes, commit suicide, the supreme boon that he has bestowed on man among all the penalties of life, nor bestow eternity on mortals or recall the deceased, nor cause a man that has lived not to have lived or one that has held high office not to have held itand that he has no power over what is past save to forget it, and (to link our fellowship with God by means of frivolous arguments as well) that he cannot cause twice ten not to be twenty, or do many things on similar lines: which facts unquestionably demonstrate the power of nature, and prove that it is this that we mean by the word 'God.' It will not have been irrelevant to have diverged to these topics, which have already been widely disseminated because of the unceasing enquiry into the nature of God.

6. Let us return from these questions to the remaining facts of nature. We have stated that the stars are attached to the firmament, not assigned to each of us in the way in which the vulgar believe, and dealt out to mortals with a degree of radiance proportionate to the lot of each, the brightest stars to the rich, the smaller ones to the poor, the dim to those who are worn out: they do not each rise with their own human being, nor indicate by their fall that someone's life is being extinguished. There is no such close alliance between us and the sky that the radiance of the stars there also shares our fate of mortality. When the stars are believed to fall, what happens is that owing to their being overfed with a draught of liquid they give back the surplus with a fiery flash, just as with us also we see this occur with a stream of oil when lamps are lit But the heavenly bodies have a nature that is eternalthey interweave the world and are blended with its weft; yet their potency has a powerful influence on the earth, indeed it is owing to the effects that they produce and to their brilliance and magnitude that it has been possible for them to become known with such a degree of precision, as we shall show in the proper place. Also the system of the revolutions of the sky will be more appropriately stated when we deal with geography, since it is entirely related to the earth; only we must not postpone the discoveries that have been made as to the zodiac. Tradition says that Anaximander of Miletus in the fifty-eighth Olympiad was the first person to discover the obliquity of the zodiac, that is, to open the portals of science; and that next Cleostratus explained the signs in it, beginning with the Ram and the Archer; the firmament itself having been explained long before by Atlas.

Let us now leave the frame of the world itself and treat the remaining bodies situated between the sky and the earth. The following points are certain: (1) The star called Saturn's is the highest and consequently looks the smallest and revolves in the largest orbit, returning in thirty years at the shortest to its initial station. (2) The motions of all the planets, and among them the sun and moon, follow a course contrary to that of the world, namely to the left, the world always running to the right. (3) Although they are borne on by it and carried westward with an unceasing revolution of immeasurable velocity, nevertheless they travel with an opposite motion along their respective tracks. (4) Thus it comes about that the air is not massed in a dull lethargic ball by revolving in the same direction because of the eternal rotation of the world, but is scattered into separate portions by the opposite impact of the stars. (5) Saturn is of a cold and frozen nature. The orbit of Jupiter is much below it and therefore revolves much faster, completing one rotation every twelve years. The third star is Mars, called by some Hercules; owing to the proximity of the sun it has a fiery glow; it revolves once in about two years, and consequently, owing to its excessive heat and Saturn's frost, Jupiter being situated between them combines the influence of each and is rendered healthy. (6) Next, the sun's course is divided into 360 parts. but in order that an observation taken of the shadows that it casts may come round to the starting-point, five and a quarter days per annum are added; consequently to every fourth a year an intercalary day is added to make our chronology tally with the course of the sun

Below the sun revolves a very large star named Venus, which varies its course alternately, and whose alternative names in themselves indicate its rivalry with the sun and moonwhen in advance and rising before dawn it receives the name of Lucifer, as being another sun and bringing the dawn, whereas when it shines after sunset it is named Vesper, as prolonging the daylight, or as being a deputy for the moon. This property of Venus was first discovered by Pythagoras of Samos about the 42nd Olympiad, [612-609 BC] 142 years after the foundation of Rome. Further it surpasses all the other stars in magnitude, and is so brilliant that alone among stars it casts a shadow by its rays. Consequently there is a great competition to give it a name, some having called it Juno, others Isis, others the Mother of the Gods. Its influence is the cause of the birth of all things upon earth: at both of its risings it scatters a genital dew with which it not only fills the conceptive organs of the earth but also stimulates those of all animals. It completes the circuit of the zodiac every 348 days, and according to Timaeus is never more than 46 degrees distant from the sun. The star next to Venus is Mercury, by some called Apollo; it has a similar orbit, but is by no means similar in magnitude or power. It travels in a lower circle. with a revolution nine days quicker, shining sometimes before sunrise and sometimes after sunset, but according to Cidenas and Sosigenes never more than 22 degrees away from the sun. Consequently the course of these stars also is peculiar, and not shared by those above-mentioned: those are often observed to be a quarter or a third of the heaven away from the sun and travelling against the sun, and they all have other larger circuits of full revolution, the specification of which belongs to the theory of the Great Years.

But the wonder of everyone is vanquished by the last star, the one most familiar to the earth, and devised by nature to serve as a remedy for the shadows of darknessthe moon. By the riddle of her transformations she has racked the wits of observers, who are ashamed that the star which is nearest should be the one about which we know least -- always waxing or waning, and now curved into the horns of a sickle, now just halved in size, now rounded into a circle; spotted and then suddenly shining clear; vast and full-orbed, and then all of a sudden not there at all; at one time shining all night and at another rising late and for a part of the day augmenting the light of the sun, eclipsed and nevertheless visible during the eclipse, invisible at the end of the month when she is not believed to be in trouble; again at one time low down and at another up aloft, and not even this in a uniform way, but sometimes raised to the sky and sometimes touching the mountain-tops, now borne up to the North and now carried down to the South. The first human being to observe all these facts about her was Endymionwhich accounts for the traditional story of his love for her. We forsooth feel no gratitude towards those whose assiduous toil has given us illumination on the subject of this luminary, while owing to a curious disease of the human mind we are pleased to enshrine in history records of bloodshed and slaughter so that persons ignorant of the facts of the world may be acquainted with the crimes of mankind.

The moon then is nearest to the pole, and therefore has the smallest orbit, completing the same distance every 271/3 days that Saturn the highest star covers, as we have said, in 30 years. Then she lingers two days in conjunction with the sun, and after the 30th day at latest sets out again on the same coursebeing perhaps our teacher as to all the facts that it has been possible to observe in the heavens; (1) that the year is to be divided into twelve monthly spaces, because she herself that number of times follows the sun in his return to his starting point; (2) that she is governed by the sun's radiance as are the rest of the stars, as in fact she shines with a light entirely borrowed from him, like the light which we see flickering reflected in water; (3) that consequently she only causes water to evaporate with a rather gentle and imperfect force, and indeed increases its quantity, whereas the sun's rays dry it up; (4) also that the reason why she is seen to vary in her light is that she is full only when opposite to the sun, and on the remaining days shows as much light from herself to the earth as she herself conceives from the sun; though (5) she is indeed invisible when in conjunction with the sun, because being turned towards him she gives back the entire draught of light to the source from which she receives it; (6) but that the stars are undoubtedly nourished by the moisture of the earth, since she is sometimes seen spotted in half her orb, clearly because she has not vet got sufficient strength to go on drinkingher spots being merely dirt from the earth taken up with the moisture; (7) but that her eclipses and those of the sun, the most marvellous and indeed portentous occurrence in the whole of our observation of nature, serve as indications of their dimensions and shadow.

7. It is in fact obvious that the sun is hidden by the passage across it of the moon, and the moon by the interposition of the earth, and that they retaliate on one another, the same rays of the sun being taken away from the earth by the moon intervening and from the moon by the earth: at the transit of the former a sudden shadow passes over the earth, and in return the shadow of the latter dims the heavenly body (the moon), and the darkness is merely the earth's shadow, but the shape of the shadow is conical, resembling a spinning-top upside down, as it impinges only with its point and does not go beyond the altitude of the moon, because no other star is obscured in the same way, and a conical figure always tapers off into a point: that shadows are made to disappear by distance is proved when birds fly to extreme heights. Consequently the frontier between the moon and the other heavenly bodies is at the point where the air ends and the aether begins. All the space above the moon is clear and filled with continual light, but to us the stars are visible through the night in the same way as other lights in shadows. And these are the reasons why the moon wanes in the night-time; but both of her wanings are irregular and not monthly, because of the slant of the zodiac and the widely varying curves of the moon's course, as has been stated, the motion of the heavenly bodies not always tallying in minute fractional quantities.

8. This theory leads mortal minds upward to heaven, and discloses to their observation from that height, as it were, the greatness of the three greatest parts of the universe; clearly it would not be possible for the whole of the sun to be eclipsed from the earth by the passage of the moon between them if the earth were larger than the moon. The vast size of the sun will be shown with the more certainty from the two bodies, so that there is no need to investigate its size by the evidence of the eyes and by logical inference, arguing that it is immeasurably large for the following reasons: (1) the shadow that it throws of rows of trees along the balks of fields are at equal distances apart for ever so many miles, just as if over the whole space the sun were in the centre; (2) during the equinoxes it reaches the vertical simultaneously for all the inhabitants of the southern region; (3) the shadows of the people living round the Tropic of Cancer fall northward at midday but westward at sunrise, which could not happen unless the sun were much larger than the earth; (4) when it is rising its breadth exceeds Mount Ida, overlapping it widely right and leftand that though it is separated from it by so great a distance.

The eclipse of the moon supplies indubitable proof of the size of the sun, just as the sun itself when it suffers eclipse proves the smallness of the earth. For shadows are of three shapes, and it is clear that, if the solid object that throws a shadow is equal in area to the shaft of light, the shadow projected is shaped like a pillar and is of infinite length, but if the solid body is larger than the light, the shadow has the shape of an upright spinning-top, so that it is narrowest at the bottom, and infinite in length as in the former case, while if the solid is smaller than the light the result is the figure of a cone narrowing down to end in a point, and this is the nature of the shadow observed during an eclipse of the moon; hence it is proved without any further possibility of doubt remaining that the sun exceeds the earth's size. Indeed, this is also proved by the silent testimony of nature herself; for why in the division of the turns of the year does the winter sun retire, so as to refresh the earth with the darkness of the nights? when otherwise it would unquestionably scorch up the earth, and even as it is does so in a certain part, so great is its magnitude.

The first person indeed of Roman nationality who published an explanation of both kinds of eclipse was Sulpicius Gallusthe colleague in the consulship of Marcus Marcellus, but at the time military tribunewho delivered the army from fear when on the day before the defeat a of King Perseus by Paulus he was brought before an assembly by the commander-in chief to foretell an eclipse; and later also by writing a treatise. The original discovery was made in Greece by Thales of Miletus, who in the fourth year of the 48th Olympiad (585 BC.) foretold the eclipse of the sun that occurred in the reign of Alvattes, in the 170th year after the foundation of Rome. After their time the courses of both stars for 600 years were prophesied by Hipparchus, whose work embraced the calendar of the nations and the situations of places and aspects of the peopleshis method being, on the evidence of his contemporaries none other than full partnership in the designs of nature. O mighty heroes, of loftier than mortal estate, who have discovered the law of those great divinities and released the miserable mind of man from fear, mortality dreading as it did in eclipses of the stars crimes or death of some sort (those sublime singers, the bards Stesichorus and Pindar, clearly felt this fear owing to an eclipse of the sun), or in the dying of the moon inferring that she was poisoned and consequently coming to her aid with a noisy clattering of cymbals (this alarm caused the Atheman general Nicias, in his ignorance of the cause, to be afraid to lead his fleet out of harbour, so destroying the Athenians' resources: all hail to your genius, ye that interpret the heavens and grasp the facts of nature, discoverers of a theory whereby you have vanquished gods and men! for who beholding these truths and the regularity of the stars' periods of trouble (for so it has pleased you to call them), would not forgive his own destiny for the generation of mortals?

Now I will briefly and summarily touch on facts that are admitted about the same matters, giving an account of them only at necessary points and in a cursory manner, because such theorizing does not form part of the task that I have set in hand, and also it is less surprising that explanations cannot be produced for all the facts than that agreement has been reached on some of them.

10. It is certain that eclipses recur in cycles of 223 monthseclipses of the sun only when the moon is in her last or first phase (this is called their 'conjunction'), eclipses of the moon only at full moonand always within the period of their last occurrence; but that yearly at fixed days and hours eclipses of either star occur below the earth, and that even when they occur above the earth they are not visible everywhere, sometimes owing to clouds, more often because the earth's globe stands in the way of the world's curvature. Less than 200 years ago the penetration of Hipparchus discovered that an eclipse of the moon also sometimes occurs four months after the one before and an eclipse of the sun six months, and that the latter when above earth is hidden twice in thirty days, but that this eclipse is visible to different nations, and the most remarkable features of this remarkable occurrencethat when it comes about that the moon is obscured by the shadow of the earth, this sometimes happens to it from the west side and sometimes from the east: and he also discovered for what exact reason, although the shadow causing the eclipse must from sunrise onward be below the earth, it happened once in the past that the moon was eclipsed in the west while both luminaries were visible above the earth. For the eclipse of both sun and moon within 15 days of each other has occurred even in our time, in the year of the third consulship of the elder Emperor Vespasian and the second consulship of the younger.

11. It is unquestionable that the moon's horns are always turned away from the sun, and that when waxing she faces east and when waning west; and that the moon shines 47 minutes longer daily from the day after new moon to full and 47 minutes less daily to her wane, while within 14 degrees of the sun she is always invisible. This fact proves that the planets are of greater magnitude than the moon, since these occasionally become unble even on reaching 7 degrees' distance; but their altitude makes them appear smaller, just as the sun's radiance makes the fixed stars invisible in daytime, although they are shining as much as in the night, which becomes manifest at a solar eclipse and also when the star is reflected in a very deep well.

12. The three planets whose positions we have stated to be above the sun travel with the sun when they set and are never more than 11 degrees separate from the sun at dawn when they rise. Afterwards they retire from contact with his rays, and make their morning or 'first' stations in a triangle 120 degrees away, and subsequently their evening risings opposite 180 degrees away, and again approaching from the other side, make their evening or 'second' stations 120 degrees away, till the sun overtaking them at 12 degrees obscures themthis is called their evening setting. The planet Mars being nearer feels the sun's rays even from its quadrature, at an angle of 90 degrees, which has given to his motion after each rising the name of 'first' or 'second ninety-degree.' At the same time Mars remains stationary in the signs of the zodiac for periods of six months (otherwise having a two-mouth period), whereas Jupiter and Saturn spend less than four months in each station. The two lower planets (Mercury and Venus) are similarly obscured at their evening conjunction, and when left by the sun make their morning rising the same number of degrees away, and from the further limits of their distance follow the sun and when they have overtaken him are hidden in their morning setting and pass away. Then they rise in the evening at the same distance apart, as far as the limits we have stated. From these they pass backward to the sun, and disappear in their evening setting. The planet Venus actually makes two stations, morning and evening, after each rise, from the furthest limits of her distance. Mercury's stations have too short a period to be perceptible.

13. This is the system of the shining and occultation of the planets: it is more complicated from their motion and involves many remarkable facts, inasmuch as they change their magnitude and their colours, and both approach the North and retire towards the South, and suddenly are seen closer to the earth or to the sky. And although our account of these matters will differ in many points from that of our predecessors, we confess that credit for these points also must be given to those who first demonstrated the methods of investigating them: only nobody must abandon the hope that the generations are constantly making progress.

All these occurrences are due to a plurality of causes. The first is the factor of the circles which in the case of the stars the Greeks designate apsides or arcs (it will be necessary to employ Greek terms). Each planet has its own circle, and these are not the same as those of the firmament, since the earth between the two vertices, named in Greek poles, is the centre of the sky, and also of the zodiac, which is situated on a slant between the poles. [All these facts are always established beyond doubt by the method of compasses.] Therefore the special arc of each is drawn from a different centre, and consequently they have different orbits and dissimilar motions, because the inner arcs must necessarily be shorter. It follows that the points of the arcs highest above the centre of the earth are: in the case of Saturn in Scorpio, in that of Jupiter in Virgo, of Mars in Leo, of the sun in the Twins, of Venus in the Archer, of Mercury in Capricorn, of the moon in the Bull, at the middle of each, and the points lowest and nearest to the centre of the earth are opposite. The result of this is that they appear to move slower and to be smaller when they are travelling at the highest point of their circuit, but to be larger and travel faster when they have come nearer to the earth, not because they actually accelerate or reduce their natural motions, which are fixed and individual to them, but because lines drawn from the top of the arc to the centre necessarily converge like the spokes of a wheel, and the same motion at one time is perceived as faster and at another slower according to its distance from the centre.

Another reason of their elevations is because they have the points of their arcs highest from their centre in different signsSaturn in the 20th degree of the Scales, Jupiter in the 15th of the Crab, Mars in the 28th of Capricorn, the sun in the 29th of the Ram, Venus in the 27th of the Fishes, Mercury in the 15th of Virgo, the moon in the 4th of the Bull.

A third explanation of their altitudes is explained by the dimensions of the firmament, not that of a circle, the eye judging them to rise or to sink through the depth of the air.

Linked with this is the cause of the latitudes of the zodiac and of its obliquity. The stars we have mentioned travel through the zodiac, and the only habitable part of the earth is what lies beneath itall the other parts towards the poles are frost-bound. Only the planet Venus goes two degrees outside the zodiac; this is understood to be the reason that causes some animals to be born even in the desert places of the world. The moon also wanders through the whole of its breadth, but without going at all outside it. The planet Mercury diverges very widely from these, but without wandering over more than 6 of the 12 degrees of latitude of the zodiac, and these 6 not uniformly but two in the middle of the zodiac, four above it and two below it. Then the sun travels unevenly in the middle of the zodiac between the two halves with a wavy serpentine course, the planet Mars over 4 degrees in the middle, Jupiter one in the middle and two above it, Saturn two like the sun. This will be the principle of the latitudes of the planets when setting towards the South or rising towards the North. Most people have supposed that with this system agrees also the third mentioned above, that of their rising from the earth to the sky, and that this ascent also is made simultaneously; but this is a mistake. To refute them it is necessary to develop an extremely abstruse argument that embraces all the causes mentioned

It is agreed that the planets are nearest to the earth in both altitude and latitude at their evening setting, and that their morning risings occur at the beginning of both altitude and latitude, while their stations occur in the middle sections of the altitudes, called 'ecliptics.' It is similarly admitted that their velocity increases as long as they are in the neighbourhood of the earth and decreases when they withdraw from it to a height: this theory is specially supported by the apogees of the moon. It is equally undoubted that the three higher ones moreover increase their motion in their morning risings and diminish it from their first (morning) stations to their second (evening) stations. In view of these facts it will be evident that the latitudes are ascended from their morning rising, because in that state their acceleration first begins to diminish, but in their first stations their altitude also is ascended, since then the numbers first begin to be reduced and the stars begin to recede. The reason for this must especially be given. When struck in the degree that we stated and by a triangular ray of the sun they are prevented from pursuing a straight course, and are lifted upward by the fiery force. This cannot be directly perceived by our sight, and therefore they are thought to be stationary, which has given rise to the term 'station.' Then the violent force of the same ray advances and compels them by the impact of the heat to retire. This occurs much more at their evening rising, when they are driven out to the top of their apsides by the full opposing force of the sun, and appear very small because they are at the distance of their greatest altitude and are moving with their smallest velocitywhich is proportionately smaller when this occurs in the highest signs of their apsides. From their evening rise their altitude is descended with a velocity now decelerating less and less, but not accelerating before their second stations, when their altitude also is descended, the ray passing above them from the other side and pressing them down again to the earth with the same force as that with which it had raised them to the sky from the former triangle. So much difference does it make whether the rays come from below or from above, and the same things occur far more in the evening setting.

This is the theory of the higher stars; that of the rest is more difficult and has been explained by nobody before ourselves.

14. First therefore let us state the reason why Venus never departs more than 46 degrees and Mercury never more than 23 degrees from the sun, and why they often retire and return towards the sun within those limits. As situated below the sun both have arcs that are the opposite of those of the other

planets, and as much of their circle is below the earth as that of the planets mentioned before is above it: and they cannot be further from it than they are because the curve of their arcs does not allow greater elongation there; consequently the edges of their arcs put a limit on a similar principle for each, and compensate for the dimensions of their longitude by the enlargement of their latitude. But, it will be objected, why do they not reach 46 and 23 degrees always? As a matter of fact they do, but the explanation escapes the theorists. For it is manifest that even their arcs alter, because they never cross the sun; accordingly when the edges have fallen on one side or the other into the actual degree of the sun, then the stars also are understood to have reached their longest distances, but when the edges are short of that, they themselves too are compelled to return with proportionately greater velocity, since with each of them that is always the extreme limit.

This also explains the contrary principle of their motions. For the higher planets travel most quickly in their evening setting, whereas these travel most slowly, and the former are farthest from the earth when their pace is slowest but the latter are highest when their pace is quickest the reason being that with the latter the circumference of the circle accelerates their pace in the same manner as proximity to the centre does in the case of the former; the former begin to decelerate from their morning setting, but the latter to accelerate. The former travel backward from their morning to their evening station, the planet Venus from her evening to her morning station. But she begins to climb her latitude after her morning rise. but after her morning station to ascend her altitude and follow the sun, being swiftest and highest at her morning setting; whereas she begins to descend in latitude and decelerate after her evening rising, and to turn back and simultaneously to descend in altitude after her evening station; on the other hand the planet Mercury begins to climb in both ways after his morning rising, but after his evening rising to descend in latitude, and following the sun at an interval of 15 degrees he stands motionless for almost four days. Afterwards he descends from his altitude and proceeds back from his evening setting to his morning rise. And only this planet and the moon set in as many days as they have risen in; Venus ascends in 15 times as many days as she sets in, while Saturn and Jupiter descend in twice as many, and Mars in actually four times as many. So great is the variety of nature; but the reason is evidentbodies that strain up into the heat of the sun also have difficulty in descending.

15. Many more facts can be produced about these mysteries of nature and the laws that she obeysfor example, in the case of the planet Mars (whose course it is very difficult to observe) that it never makes its station with Jupiter at an angle of 120. and very seldom with Jupiter separated 60 (which amounts to 1/6th of the celestial sphere), and never makes its rises simultaneously with Jupiter except in two signs only, Cancer and Leo, whereas the planet Mercury rarely makes its evening rises in Pisces, and most frequently in Virgo, its morning rises in Libra, and also its morning rises in Aquarius, very rarely in Leo; it does not make its return in Taurus and in Gemini, and not below the 25th degree in Cancer; Gemini is the only sign in which the moon makes conjunction with the sun twice, Sagittarius the only one in which she does not meet him at all, Aries the only one in which the old moon and the new moon are visible on the same day or night (and this too it has happened to few mortals to see, hence Lynceus's reputation for keen sight); the longest period of invisibility for the planets Saturn and Mars is 170 days, for Jupiter 36 days; the shortest periods for all these are 10 days less; Venus's period is 69 days or at shortest 52, Mercury's 13 or at longest 17

16. The colours of the planets vary with their altitudes, inasmuch as they are assimilated to the stars into whose atmosphere they come in rising, and the circuit of another's path modifies their colour in either direction as they approach. a colder circuit to pallor, a hotter one to redness, a windy one to a leaden colour, the sun and the intersection of its orbit with theirs, and also the extremities of their paths, changing them to black darkness. It is true that each has its own special hueSaturn white, Jupiter transparent, Mars fiery, Lucifer bright white, Vesper glaring, Mercury radiant, the moon soft, the sun when rising glowing and afterwards radiant; with these being causally connected also the appearance of the fixed stars. For at one time there is a dense crowd of stars in the sky round the circle of the half-moon, a fine night giving them a gentle radiance, but at another time they are scarce, so that we wonder at their flight, when the full moon hides them or when the rays of the sun or the planets above-mentioned dim our sight. But the moon herself also is undoubtedly sensitive to the variations of the strength of impact of the rays of the sun, as moreover the curve of the earth dulls their impact, except when the impact of the rays meets at a right angle. And so the moon is at half in the sun's quadrature, and curved in a hollow circle in its trinal aspect, but waxes to full at the sun's opposition, and then waning exhibits the same configurations at corresponding intervals, on the same principle as the three planets above the sun.

17. The sun itself has four differences, as there are two equinoxes, in spring and autumn, when it coincides with the

centre of the earth at the eighth degree of Aries and Libra, and two changes of its course, in the eighth degree of Capricorn at midwinter when the days begin to lengthen and in the same degree of Cancer at the summer solstice. The variation is due to the slant of the zodiac, as at every moment an equal part of the firmament is above and below the earth; but the planets that follow a straight path at their rising keep their light for a longer tract and those that follow a slanting path pass in a swifter period.

18. Most men are not acquainted with a truth known to the founders of the science from their arduous study of the heavens, that what when they fall to earth are termed thunderbolts are the fires of the three upper planets, particularly those of Jupiter, which is in the middle positionpossibly because it voids in this way the charge of excessive moisture from the upper circle (of Saturn) and of excessive heat from the circle below (of Mars); and that this is the origin of the myth that thunderbolts are the javelins hurled by Jupiter. Consequently heavenly fire is spit forth by the planet as crackling charcoal flies from a burning log, bringing prophecies with it, as even the part of himself that he discards does not cease to function in its divine tasks. And this is accompanied by a very great disturbance of the air, because moisture collected causes an overflow, or because it is disturbed by the birth-pangs so to speak of the planet in travail.

19. Many people have also tried to discover the distances of the planets from the earth, and have given out that the distance of the sun from the moon is 19 times that of the moon itself from the earth. The penetrating genius of Pythagoras, however, inferred that the distance of the moon from the earth was 15,750 miles, and that of the sun from the moon twice that figure, and of the sun from the twelve signs of the Zodiac three times. Our fellow-countryman Sulpicius Gallus also held this view.

20. But occasionally Pythagoras draws on the theory of music, and designates the distance between the earth and the moon as a whole tone, that between the moon and Mercury a semitone, between Mercury and Venus the same, between her and the sun a tone and a half, between the sun and Mars a tone (the same as the distance between the earth and the moon), between Mars and Jupiter half a tone, between Jupiter and Saturn half a tone, between Saturn and the zodiac a tone and a half; the seven tones thus producing the so-called diapason, a universal harmony; in this Saturn moves in the Dorian mode, Jupiter in the Phrygian, and similarly with the other planetsa refinement more entertaining than convincing.

21. A stade is equivalent to 125 Roman paces, that is 625 feet. Posidonius holds that mists and winds and clouds reach to a height of not less than 5 miles from the earth, but that from that point the air is clear and liquid and perfectly luminous, but that the distance between the cloudy air and the moon is 250,000 miles and between the moon and the sun 625,000 miles, it being due to this distance that the sun's vast magnitude does not burn up the earth. The majority of writers, however, have stated that the clouds rise to a height of 111 miles. These figures are really unascertained and impossible to disentangle, but it is proper to put them forward became they have been put forward already, although they are matters in which the method of geometrical inference, which never misleads, is the only method that it is possible not to reject, were anybody desirous of pursuing such questions more deeply, and with the intention of establishing not precise measurement (for to aspire to that would mark an almost insane absorption in study) but merely a conjectural calculation. For since it appears from the sun's revolution that the circle through which its orb travels extends nearly 366 degrees, and since the diameter of a circle always measures a little less than $\frac{1}{3} + \frac{1}{21}$ of the circumference, it appears that, as half the circle is subtracted by the interposition of the earth at the centre, the measure of the sun's altitude comprises about tth of this conjecturally estimated immense space of the solar circle round the earth, and the moon's altitude tth, since the moon runs in a circuit that is much shorter than the sun's; so that it comes between the sun and the earth. It is marvellous to what length the depravity of man's intellect will go when lured on by some trifling success, in the way in which reason furnishes impudence with its opportunity in the case of the calculations above stated. And when they have dared to guess the distances of the sun from the earth they apply the same figures to the sky, on the ground that the sun is at its centre, with the consequence that they have at their finger's ends the dimensions of the world also. For they argue that the circumference of a circle is us times its diameter, as though the measure of the heavens were merely regulated from a plumbline! The Egyptian calculation published by Petosiris and Nechepsos infers that one degree of the lunar circle measures (as has been said) just over $4\frac{1}{8}$ miles at the least one degree of the widest circle, Saturn's, twice that size, and one of the sun's circle, which we stated to be in the middle, the mean between the other two. This computation is a most shameful business, since the addition of the distance of the zodiac itself to the

circle of Saturn produces a multiple that is even beyond reckoning.

22. A few facts about the world remain. There are also stars that suddenly come to birth in the heaven itself; of these there are several kinds. The Greeks call them 'comets,' in our language 'long-haired stars,' because they have a blood-red shock of what looks like shaggy hair at their top. The Greeks also give the name of 'bearded stars' to those from whose lower part spreads a mane resembling a long beard. 'Javelinstars' quiver like a dart; these are a very terrible portent. To this class belongs the comet about which Titus Imperator Caesar in his 5th consulship wrote an account in his famous poem, that being its latest appearance down to the present day. The same stars when shorter and sloping to a point have been called 'Daggers': these are the palest of all in colour, and have a gleam like the flash of a sword, and no rays, which even the Quoit-star, which resembles its name in appearance but is in colour like amber, emits in scattered form from its edge. The 'Tub-star' presents the shape of a cask, with a smoky light all round it. The 'Horned star' has the shape of a horn, like the one that appeared when Greece fought the decisive battle of Salamis. The 'Torch-star' resembles glowing torches, the 'Horse-star horses' manes in very rapid motion and revolving in a circle. There also occurs a shining comet whose silvery tresses glow so brightly that it is scarcely possible to look at it, and which displays within it a shape in the likeness of a man's countenance. There also occur 'Goat comets,' enringed with a sort of cloud resembling tufts of hair. Once hitherto it has happened that a 'Mane-shaped' comet changed into a spear; this was in the 108th [348-345 BC] Olympiad, AUC 408 [346 BC]. The shortest period of visibility on record for a comet is 7 days, the longest 80.

23. Some comets move, like the planets, but others are fixed and stationary, almost all of them towards the due North, not in any particular part of it, though chiefly in the luminous region called the Milky Way. Aristotle also records that several may be seen at the same timea fact not observed by anyone else, as far as I am awareand that this signifies severe winds or heat. Comets also occur in the winter months and at the south pole, but comets in the south have no rays. A terrible comet was seen by the people of Ethiopia and Egypt, to which Typhon the king of that period gave his name; it had a fiery appearance and was twisted like a coil, and it was very grim to behold: it was not really a star so much as what might be called a ball of fire. Planets and all other stars also occasionally have spreading hair. But sometimes there is a comet in the western sky, usually a terrifying star and not easily explated: for instance, during the civil disorder in the consulship of Octavius, and again during the war between Pompey and Caesar, or in our day about the time of the poisoning which secured the bequest of the empire by Claudius Caesar to Domitius Nero, and thereafter during Nero's principate shining almost continuously and with a terrible glare. People think that it matters in what direction a comet darts, what star's strength it borrows, what shapes it resembles, and in what places it shines; that if it resembles a pair of flutes. It is a portent for the art of music, in the private parts of the constellations it portends immorality, if it forms an equilateral triangle or a rectangular quadrilateral in relation to certain positions of the fixed stars, it portends men of genius and a revival of learning, in the head of the Northern or the Southern Serpent it brings poisonings.

The only place in the whole world where a comet is the object of worship is a temple at Rome. His late Majesty Augustus had deemed this comet very propitious to himself; as it had appeared at the beginning of his rule, at some games which, not long after the decease of his father Caesar, as a member of the college founded by him he was celebrating in honour of Mother Venus. In fact he made public the joy that it gave him in these words: 'On the very days of my Games a comet was visible for seven days in the northern part of the sky. It was rising about an hour before sunset, and was a bright star, visible from all lands. The common people believed that this star signified the soul of Caesar received among the spirits of the immortal gods, and on this account the emblem of a star was added to the bust of Caesar that we shortly afterwards dedicated in the forum.' This was his public utterance, but privately he rejoiced because he interpreted the comet as having been born for his own sake and as containing his own birth within it; and, to confess the truth, it did have a health-giving influence over the world.

Some persons think that even comets are everlasting, and travel in a special circuit of their own, but are not visible except when the sun leaves them; there are others, however, who hold that they spring into existence out of chance moisture and fiery force, and consequently are dissolved.

24. Hipparchus before-mentioned, who can never be sufficiently praised, no one having done more to prove that man is related to the stars and that our souls are a part of heaven, detected a new star that came into existence during his lifetime; the movement of this star in its line of radiance led him to wonder whether this was a frequent occurrence, whether the stars that we think to be fixed are also in motion; and consequently he did a bold thing, That would be

reprehensible even for Godhe dared to schedule the stars for posterity, and tick off the heavenly bodies by name in a list, devising machinery by means of which to indicate their several positions and magnitudes, in order that from that time onward it might be possible easily to discern not only whether stars perish and are born, but whether some are in transit and in motion, and also whether they increase and decrease in magnitudethus bequeathing the heavens as a legacy to all mankind, supposing anybody had been found to claim that inheritance!

25. There are also meteoric lights that are only seen when falling, for instance one that ran across the sky at midday in full view of the public when Germanicus Caesar was giving a gladiatorial show. Of these there are two kinds: one sort are called lampades, which means torches, the other bolides (missiles),that is the sort that appeared at the time of the disasters of Modena. The difference between them is that 'torches' make long tracks, with their front part glowing, whereas a 'bolis' glows throughout its length, and traces a longer path.

26. Other similar meteoric lights are 'beams.' in Greek dokoi, for example one that appeared when the Spartans were defeated at sea and lost the empire of Greece. There also occurs a yawning of the actual sky, called chasma,

27. and also something that looks like blood, and a fire that falls from it to the earththe most alarming possible cause of terror to mankind; as happened in the third year [349BC] of the 107th Olympiad, when King Philip was throwing Greece into disturbance. My own view is that these occurrences take place at fixed dates owing to natural forces, like all other events, and not, as most people think, from the variety of causes invented by the cleverness of human intellects; it is true that they were the harbingers of enormous misfortunes, but I hold that those did not happen because the marvellous occurrences took place but that these took place because the misfortunes were going to occur, only the reason for their occurrence is concealed by their rarity, and consequently is not understood as are the risings and setting of the planets described above and many other phenomena.

28. Stars are also seen throughout the daytime in company with the sun, usually actually surrounding the sun's orb like wreaths made of ears of corn and rings of changing colourfor instance, when Augustus Caesar in early manhood entered the city after the death of his father to assume his mighty surname. Similar haloes occur round the moon and round The principal fixed stars.

29. A bow appeared round the sun in the consulship of Lucius Opimius and Quintus Fabius, a hoop in that of Gaius Porcius and Manius Acilius, and a red ring in that of Lucius Julius and Publius Rutilius.

30. Portentous and protracted eclipses of the sun occur, such as the one after the murder of Caesar the dictator and during the Antonine war which caused almost a whole year's continuous gloom.

31. Again, several suns are seen at once, neither above nor below the real sun but at an angle with it, never alongside of nor opposite to the earth, and not at night but either at sunrise or at sunset. It is also reported that once several suns were seen at midday at the Bosphorus, and that these lasted from dawn till sunset. In former times three suns have often been seen at once, for example in the consulships of Spurius Postumius and Quintus Mucius, of Quintus Marcius and Marcus Porcius, of Marcus Antonius and Publius Dolabella, and of Marcus Lepidus and Lucius Plancus; and our generation saw this during the principate of his late Majesty Claudius, in his consulship, when Cornelius Orfitus was his colleague. It is not stated that more than three suns at a time have ever been seen hitherto.

32. Also three moons have appeared at once, for instance in the consulship of Gnaeus Domitius and Gaius Fannius.

33. A light from the sky by night, the phenomenon usually called 'night-suns,' was seen in the consulship of Gaius Caecilius and Gnaeus Papirius and often on other occasions causing apparent daylight in the night.

34. In the consulship of Lucius Valerius and Gaius Marius a burning shield scattering sparks ran across the sky at sunset from west to east.

35. In the consulship of Gnaeus Octavius and Gaius Scribonius a spark was seen to fall from a star and increase in size as it approached the earth, and after becoming as large as the moon it diffused a sort of cloudy daylight, and then returning to the sky changed into a torch; this is the only record of this occurring. It was seen by the proconsul Silanus and his suite.

36. Also stars appear to shoot to and fro; and this invariably portends the rise of a fierce hurricane from the same quarter.

37. Stars also come into existence at sea on land. I have seen a radiance of star-like appearance clinging to the javelins of soldiers on sentry duty at night in front of the rampart; and on a voyage stars alight on the yards and other parts of the ship, with a sound resembling a voice, hopping from perch to perch in the manner of birds. These when they come singly are disastrously heavy and wreck ships, and if they fall into the hold burn them up. If there are two of them, they denote safety and portend a successful voyage; and their approach is said to put to flight the terrible star called Helena: for this reason they are called Castor and Pollux, and people pray to them as gods for aid at sea. They also shine round men's heads at evening time; this is a great portent. All these things admit of no certain explanation; they are hidden away in the grandeur of nature.

38. So much as to the world itself and the stars. Now the remaining noteworthy facts as to the heavens: for the name 'heaven' was also given by our ancestors to this which is otherwise designated 'air'the whole of that apparently empty space which pours forth this breath of life. This region below the moon, and a long way below it (as I notice is almost universally agreed), blends together an unlimited quantity from the upper element of air and an unlimited quantity of terrestrial vapour, being a combination of both orders. From it come clouds, thunder-claps and also thunderbolts, hail, frost, rain, storms and whirlwinds; from it come most of mortals' misfortunes, and the warfare between the elements of nature. The force of the stars presses down terrestrial objects that strive to move towards the sky, and also draws to itself things that lack spontaneous levitation. Rain falls, clouds rise, rivers dry up, hailstorms sweep down; rays scorch, and impinging from every side on the earth in the middle of the world, then are broken and recoil and carry with them the moisture they have drunk up. Steam falls from on high and again returns on high. Empty winds sweep down, and then go back again with their plunder. So many living creatures draw their breath from the upper air; but the air strives in the opposite direction, and the earth pours back breath to the sky as if to a vacuum. Thus as nature swings to and fro like a kind of sling, discord is kindled by the velocity of the world's motion. Nor is the battle allowed to stand still, but is continually carried up and whirled round, displaying in an immense globe that encircles the world the causes of things, continually overspreading another and another heaven interwoven with the clouds. This is the realm of the winds. consequently their nature is here pre-eminent, and almost includes all the rest of the phenomena caused by the air, as most men attribute the hurling of thunderbolts and lightning to the winds' violence, and indeed hold that the cause of the rain of stones that sometimes occurs is that the stones are caught up by the wind; and likewise many other things. On this account more facts have to be set out at the same time.

39. Storms and rain obviously have some regular causes, but some that are accidental, or at all events not hitherto explained For who can doubt that summer and winter and the yearly vicissitudes observed in the seasons are caused by the motion of the heavenly bodies? Therefore as the nature of the sun is understood to control the year's seasons, so each of the other stars also has a force of its own that creates effects corresponding to its particular nature. Some are productive of moisture dissolved into liquid, others of moisture hardened into frost or coagulated into snow or frozen into hail, others of a blast of air, others of warmth or heat, others of dew, others of cold. But it must not be thought that the stars are of the size that they appear to the sight, since the consideration of their immense altitude proves that none of them is smaller than the moon. Consequently each of them exercises its own nature in its own motion, a fact which the transits of Saturn in particular make clear by their storms of rain. Nor does this power belong to the moving stars only, but also to many those that are fixed to the sky, whenever they are impelled forward by the approach of the planets or goaded on by the impact of their rays, as we observe occurring in the case of the Little Pigs, the Greek name for which is consequently the Hyades, a word denoting rain. Indeed some stars move of themselves and at fixed timescompare the rising of the Kids. But the rising of the constellation Arcturus is almost always accompanied by a hail-storm.

40. For who is not aware that the heat of the sun increases at the rising of the Lesser Dog-star, whose effects are felt on earth very widely? At its rise the seas are rough, wine in the cellars ripples in waves, pools of water are stirred. There is a wild animal in Egypt called the gazelle that according to the natives stands facing this dog-star at its rise, and gazing at it as if in worship, after first giving a sneeze. It is indeed beyond doubt that dogs throughout the whole of that period are specially liable to rabies.

41. Moreover also the parts of some constellations have an influence of their ownfor instance at the autumnal equinox and at midwinter, when we learn by the storms that the sun is completing its orbit; and not only by falls of rain and storms, but by many things that happen to our bodies and to the fields. Some men are paralysed by a star, others suffer periodic disturbances of the stomach or sinews or bead or mind. The olive and white poplar and willow turn round their leaves at the solstice. Fleabane hung up in the house to dry flowers exactly on midwinter day, and inflated skins burst. This may surprise one who does not notice in daily experience that one plant, called heliotrope, always looks towards the sun as it passes and at every hour of the day turns with it, even when it is obscured by a cloud. Indeed persistent research has

discovered that the influence of the moon causes the shells of oysters, cockles and all shell-fish to grow larger and again smaller in bulk, and moreover that the phases of the moon affect the tissues of the shrewmouse, and that the smallest animal, the ant, is sensitive to the influence of the planet and at the time of the new moon is always slack. This makes ignorance all the more disgraceful to man, especially as he admits that with some cattle diseases of the eyes increase and diminish with the moon. His excuse is the heaven's vastness. being divided at an enormous height into 72 signs, that is, shapes of things or of animals into which the learned have mapped out the sky. In them they have indeed noted 1600 stars as being specially remarkable for their influence or their appearance, for instance the seven which they have named the Pleiades in the tail of the Bull and the Little Pigs in his forehead, and Bootes the star that follows the Seven Ploughoxen.

42. I would not deny that rain and wind can arise from other causes than these; it is certain that the earth exhales a damp mist and at other times a smoky one due to vapour, and that clouds are formed out of moisture rising to a height or air condensed into moisture. Their density and bulk are conjectured with certain inference from the fact that they obscure the sun, which is otherwise visible even to those diving into water to whatever depth.

43. Consequently I would not go against the view that it is also possible for the fires of stars to fall from above into the clouds (as we often see happen. in fine weather, and the impact of these fires unquestionably shakes the air since even weapons when flung make a hissing noise); and that when they reach the cloud, a hissing steam is produced, just as when red-hot iron is plunged into water, and a coil of smoke whirls up. And I agree that these produce storms, and if there is wind or steam struggling in the cloud, it gives out claps of thunder, if it bursts out on fire, flashes of lightning, if it forces its way on a longer track, heat-lightning. The latter cleaves the cloud, the flashes burst through it, and thunderclaps are the blows of the fires colliding, causing fiery cracks at once to flash out in the clouds. It is also possible for breath emerging from the earth, when pressed down by the counter-impact of the stars, to be checked by a cloud and so cause thunder, nature choking down the sound while the struggle goes on but the crash sounding when the breath bursts out, as when a skin is stretched by being blown into. It is also possible for this breath, whatever it is, to be set on fire by the friction during its headlong progress. It is also possible for it to be struck out by the impact of the clouds, as by that of two stones, with heat-lightning flashing out like sparks. But all these occurrences are accidentalthey cause mere senseless and ineffectual thunder-claps, as their coming obeys no principle of naturethey merely cleave mountains and seas, and all their other blows are ineffectual; but the former are prophetical and sent from on high, they come by fixed causes and from their own stars

44. Similarly I am not prepared to deny that it is possible for winds or rather gusts of air to be produced also by a dry and parched breath from the earth, and also possible when bodies of water breathe out a vapour that is neither condensed into mist or solidified into clouds; and also they may be caused by the driving force of the sun, because wind is understood to be nothing else than a wave of air; and in more ways as well. For we see winds arising both from rivers and bays and from the sea even when calm, and others, called altani, arising from the land; the latter when they come back again from the sea are called turning winds, but if they go on, offshore winds.

The windings of mountains and their clustered peaks and ridges curved in an elbow or broken off into shoulders. and the hollow recesses of valleys, cleaving with their irregular contours the air that is consequently reflected from them (a phenomenon that in many place causes words spoken to be endlessly echoed) are productive of winds. So again are caverns, like the one with an enormous gaping mouth on the coast of Dalmatia, from which, if you throw some light object into it, even in calm weather a gust like a whirlwind bursts out: the name of the place is Senta. Also it is said that in the province of Cyrenaica there is a certain cliff, sacred to the South wind, which it is sacrilege for the hand of man to touch, the South wind immediately causing a sandstorm. Even manufactured vessels in many houses if shut up in the dark have peculiar exhalations. Thus there must be some cause for this

45. But there is a great difference between a gust of air and a wind. The latter, regular and blowing steadily, and felt not by some particular tract only but by whole countries, and not being breezes nor tempests but windseven their name being a masculine word--whether they are caused by the continuous motion of the world and the impact of the stars travelling in the opposite direction or whether wind is the famous 'breath' that generates the universe by fluctuating to and fro as in a sort of womb, or air whipped by the irregular impact of the planets and the non-uniform emission of their rays, or whether they issue forth from these nearer stars which are their own or fall from those stars which are fixed in the heavenit is manifest that the winds too obey a law of nature that is not unknown, even if not yet fully known.

More than twenty Greek authors of the past have published observations about these subjects. This makes me all the more surprised that, although when the world was at variance, and split up into kingdoms, that is, sundered limb from limb, so many people devoted themselves to these abstruse researches: especially when wars surrounded them and hosts were untrustworthy, and also when rumours of pirates, the foes of all mankind, terrified intending travellersso that now-a-days a person may learn some facts about his own region from the notebooks of people who have never been there more truly than from the knowledge of the nativesyet now in these glad times of peace under an emperor who so delights in productions of literature and science, no addition whatever is being made to knowledge by means of original research, and in fact even the discoveries of our predecessors are not being thoroughly studied. The rewards were not greater when the ample successes were spread out over made the discoveries in question with no other many students, and in fact the majority of these reward at all save the consciousness of benefiting posterity. Age has overtaken the characters of mankind, not their revenues, and now that every sea has been opened up and every coast offers hospitable landing, an immense multitude goes on voyagesbut their object is profit not knowledge; and in their blind engrossment with avarice they do not reflect that knowledge is a more reliable means even of making profit. Consequently in view of these thousands of persons who go on voyages I will give a more detailed account of the winds than is perhaps suited to the task I have set in hand.

46. The ancients noticed four winds in all, corresponding to the four quarters of the world (this is the reason why even Homer mentions no more)a dull-witted system, as it was soon afterwards considered; the following age added eightthis system on the other hand was too subtle and meticulous. Their successors adopted a compromise, adding to the short list four winds from the long one. There are consequently two winds in each of the four quarters of the heaven: Subsolanns blowing from the equinoctial sunrise (E.) and Vulturnus from the winter sunrise (S.E.)the former designated by the Greeks Apeliotes, the latter Burns: Auster from the sun at midday (S.) and Afriens from the winter sunset (S.W.)named in Greek Notus and Libs; Favonius from the equinoctial sunset (W.), Corus from the sunset at the solstice (N.W.)these the Greeks call Zephyr and Argestes; Septentrio from the North and Aquilo between him and sunrise at the solstice (N.E.)called in Greek Aparctias and Boreas. The more numerous scheme had inserted four between these: Thrascias (N.N.W.) in the space between Septentrio (N.) and the sunset at the solstice (N.W.) and also Caecias (E.N.E.) in the space between Aquilo (N.E.) and the equinoctial sunrise (B.) on the side of the sunrise at the solstice, and Phoenix (S.S.E.) in the space between winter sunrise (S.E.) and midday (S.), and also between Libs (S.W.) and Notus (S) the combination of the two Libonotus (S.S.W.), midway between midday (S.) and winter sunset (S.W.). Nor is this the end, inasmuch as others have also added one named Meses between Boreas (N.E.) and Caecias (E.N.E.), and Euronotus between Eurus (S.E.) and Notus (S.). There are also certain winds peculiar to particular races, which do not go outside a special region, e.g. the Athenians have Sciron, slightly diverging from Argestes (N.W.), a name unknown to the rest of Greeceelsewhere the same breeze is called Olympias: customarily all these names are taken to denote Argestni. Some people call Caecias (E.N.E.) Hellespontias, and others have other variants for these names. Similarly in the province of Narbonne the most famous of the winds is Circius (W.N.W.), which is inferior to none other at all in force and which usually carries a vessel right across the Ligurian Sea to Ostia; the same wind is not only unknown in the remaining quarters of the sky, but it does not even touch Vienne, a city of the same province, a few miles before reaching which this mighty wind is checked by the obstacle of a moderate ridge of hills. Fabianus asserts that South winds also do not penetrate Egyptwhich reveals the law of nature that even winds have their prescribed limits as well as seasons.

47. Accordingly the spring opens the seas to voyagers; at its beginning the West winds soften the wintry heaven, when the sun occupies the 25th degree of Aquarius; the date of this is Feb. 8. This also practically applies to all the winds whose positions I shall give afterwards, although every leap-year they come a day earlier, but they keep the regular rule in the period that follows. Certain persons give the name Chelidonias to the West wind on the 19th February, owing to the appearance of the swallow, but some call it Ornithias, from the arrival of the birds on the 71st day after the shortest day, when it blows for nine days. Opposite to the West wind is the wind that we have called Subsolanus (E.). The rise of the Pleiades in the same degrees of Taurus on May 10 brings summer; it is a period of South wind, Auster, the opposite of Septentrio. But in the hottest period of summer the Dog-star rises, when the sun is entering the first degree of Leothis day is July 17. The Dog-star's rise is preceded for about eight days by North-east winds: these are called the Forerunners. But

two days after his rising the North-east winds begin again, and continue blowing steadily for 30 days; these are called Etesian or Annual winds. They are believed to be softened by the sun's warmth being reinforced by the heat of the star; and they are the most regular of any of the winds. They are followed in turn by South winds, continuing to the rise of Areturus, which occurs 40 days before the autumnal equinox. With the equinox begins the North-west wind; this, the opposite of Volturnus, marks the beginning of autumn. About 44 days after the autumnal equinox the setting of the Pleiades marks the beginning of winter, which it is customary to date on November 11; this is the period of the winter Aquilo, which is very unlike the summer one mentioned above; it is opposite to the South-west wind. But for six days before the shortest day and six days after it the sea calms down for the breeding of the halcyons from which these days derive their name. The rest of the time there is wintry weather. However, not even the fury of the storms closes the sea; pirates first compelled men by the threat of death to rush into death and venture on the winter seas, but now avarice exercises the same compulsion

48. The actually coldest winds are those that we have stated to blow from the North, and their neighbour Corus (N.W.); these check the other winds and also drive away the clouds. The Southwest and especially the South are for Italy the damp winds; it is said that on the Black Sea the East-north-east also attracts clouds. The North-west and South-east are dry, except when they are falling. The North-east and North are snow winds: the North brings hailstorms, and so does the North-west. The South wind is hot, the South-east and West warm; the latter are also drier than the East wind, and in general all the northerly and westerly winds are drier than the southerly and easterly. The healthiest of all is the North wind; the South is harmful, and more so when dry, perhaps because when damp it is colder; living creatures are believed to be less hungry when it is blowing. Etesian winds usually cease at night and rise at eight o'clock in the morning; in Spain and Asia they are East winds, on the Black Sea North, and in other regions South. But they also begin to blow at midwinter then they are called the Bird-winds), but more gently and only for a few days. Two winds also change their nature with their geographical position: the South wind in Africa is fine and the North-east cloudy. All the winds blow in their own turns, usually the one opposite to the one that ceases beginning. When those next to the ones falling rise, they go round from left to right a like the sun. The fourth moon usually decides about the course of the winds for the month. Vessels by means of slacking sheets can sail in contrary directions with the same winds, so that collisions occur, usually at night, between ships on opposite tacks. The South wind causes larger waves than the Northeast because the former being below blows from the bottom of the sea but the latter from the top; consequently earthquakes following South winds are specially destructive. The South wind is more violent at night and the North-east wind in the day-time: and easterly winds continue longer than westerly. North winds usually stop after blowing an odd number of days, an observation that holds good in many other departments of nature also: this is why the odd numbers are thought to be masculine. The sun both increases and reduces the force of the windthe former when rising and setting, the latter at midday in summer seasons; consequently the winds are usually lulled at midday or midnight, because either excessive cold or excessive heat makes them slack. Also winds are lulled by rain; but they are most to be expected from quarters where the clouds have broken, revealing a clear sky.

Eudoxus however thinks that (if we choose to study the minimal circuits) there is a regular recurrence of all phenomenanot only of winds but largely of other sorts of bad weather as wellin four-yearly periods, and that the period always begins in a leap-year at the rising of Sirius.

These are our observations with regard to the winds that are regular.

49. Now as to sudden blasts, which arise as has been said from exhalations of the earth, and fall back again to the earth drawing over it an envelope of cloud; these occur in a variety of forms. The fact is that their onrush is quite irregular, like that of mountain torrents (as we have pointed out is the view of certain persons), and they give forth thunder and lightning. If travelling with a heavier momentum they burst a great gap in a dry cloud, they produce a storm called by the Greeks a cloudburst; but if they break out from a downward curve of cloud with a more limited rotation, they cause a whirl unaccompanied by fireI mean by lightningthat is called a typhoon, which denotes a whirling cloudburst. This brings down with it a portion of heat torn from a cloud, which it turns and whirls round, increasing its own downward velocity by its weight, and shifting from place to place with a rapid whirl: it is specially disastrous to navigators, as it twists round and shatters not only the yards, but the vessels themselves, leaving only the slender remedy of pouring out vinegar in advance of its approach, vinegar being a very cold substance. The same whirlwind when beaten back by its very

impact snatches things up and carries them back with it to the sky, sucking them high aloft.

50. But if it bursts out of a larger cavern of downward pressing cloud but not so wide a one as in the case of a storm, and is accompanied by a crashing noise, this is what they call a which overthrows everything whirlwind in its neighbourhood. When the same rages hotter and with a fiery flow, it is called a rester, as while sweeping away the things it comes in contact with it also scorches them up. But a typhoon does not occur with a northerly wind, nor a cloudburst with snow or when snow is lying. If it flared up as soon as it burst the cloud, and had fire in it, did not catch fire afterwards, it is a thunderbolt. It differs from a fiery pillar in the way in which a flame differs from a fire: a fiery pillar spreads out its blast widely, whereas a thunderbolt masses together its onrush. On the other hand a tornado differs from a whirlwind by returning, and as a whiz differs from a crash; a storm is different from either in its extentit is caused by the scattering rather than the bursting of a cloud. There also occurs a darkness caused by a cloud shaped like a wild monsterthis is direful to sailors. There is also what is called a column, when densified and stiffened moisture raises itself aloft; in the same class also is a waterspout, when a cloud draws up water like a pipe.

51. Thunderbolts are rare in winter and in summer, from opposite causes. In winter, owing to the thicker envelope of cloud, the air is rendered extremely dense, and all the earth's exhalation being stiff and cold extinguishes whatever fiery vapour it receives. This reason renders Scyrthia and the frozen regions round it immune from the fall of thunderbolts, while conversely the excessive heat does the same for Egypt, inasmuch as the hot and dry exhalations from the earth condense very rarely, and only form thin and feeble clouds. But in spring and autumn thunderbolts are more frequent, their summer and winter causes being combined in each of those seasons: this explains why they are frequent in Italy, where the milder winter and stormy summer make the air more mobile, and it is always somewhat vernal or autumnal. Also in the parts of Italy that slope down from the north towards the warmth, such as the district of Rome and the Campagna, lightning occurs in winter just as in summer, which does not happen in any other locality.

52. Of thunderbolts themselves several varieties are reported. Those that come with a dry flash do not cause a fire but an explosion. The smoky ones do not burn but blacken. There is a third sort, called 'bright thunderbolts,' of an extremely remarkable nature; this kind drains casks dry without damaging their lids and without leaving any other trace, and melts gold and copper and silver in their bags without singeing the bags themselves at all, and even without melting the wax seal. Marcia, a lady of high station at Rome, was struck by lightning when enceinte, and though the child was killed, she herself survived without being otherwise injured. Among the portents in connexion with Catiline, a town-councillor of Pompei named Marcus Herennius was struck by lightning on a fine day.

53. The Tuscan writers hold the view that there are nine gods who send thunderbolts, and that these are of eleven kinds, because Jupiter hurls three varieties. Only two of these deities have been retained by the Romans, who attribute thunderbolts in the davtime to Jupiter and those in the night to Summanus, the latter being naturally rare because the sky at night is colder. Tuscany believes that some also burst out of the ground, which it calls 'low bolts,' and that these are rendered exceptionally direful and accursed by the season of winter, though all the bolts that they believe of earthly origin are not the ordinary ones and do not come from the stars but from the nearer and more disordered element: a clear proof of this being that all those coming from the upper heaven deliver slanting blows, whereas these which they call earthly strike straight. And those that fall from the nearer elements are supposed to come out of the earth because they leave no traces as a result of their rebound, although that is the principle not of a downward blow but of a slanting one. Those who pursue these enquiries with more subtlety think that these bolts come from the planet Saturn, just as the inflammatory ones come from Mars, as, for instance, when Bolsena, the richest town in Tuscany, was entirely burnt up by a thunderbolt. Also the first ones that occur after a man sets up house for himself are called 'family meteors,' as foretelling his fortune for the whole of his life. However, people think that private meteors, except those that occur either at a man's first marriage or on his birthday, do not prophecy beyond ten years, nor public ones beyond the 30th year, except those occurring at the colonization of a town.

54. Historical record also exists of thunderbolts being either caused by or vouchsafed in answer to certain rites and prayers. There is an old story of the latter in Tuscany, when the portent which they called Olta came to the city of Bolsena, when its territory had been devastated; it was sent in answer to the prayer of its king Porsina. Also before his time, as is recorded on the reliable authority of Lucius Piso in his Annals I, this was frequently practised by Numa, though when Tullus Hostilius copied him with incorrect ritual he was struck by

lightning. We also have groves and altars and rites, and among the other Jupiters, the Stavers and Thunderers and Receivers of Offerings, tradition gives us Jupiter the Invoked. On this matter the opinion of mankind varies, in correspondence with our individual dispositions. It takes a bold man to believe that Nature obeys the behests of ritual, and equally it takes a dull man to deny that ritual has beneficent powers, when knowledge has made such progress even in the interpretation of thunderbolts that it can prophecy that others will come on a fixed day, and whether they will destroy a previous one or other previous ones that are concealed: this progress has been made by public and private experiments in both fields. In consequence although such indications are certain in some cases but doubtful in others, and approved to some persons but in the view of others to be condemned, in accordance with Nature's will and pleasure, we for our part are not going to leave out the rest of the things worth recording in this department.

55. It is certain that when thunder and lightning occur simultaneously, the flash is seen before the thunderclap is heard (this not being surprising, as light travels more swiftly than sound); but that Nature so regulates the stroke of a thunderbolt and the sound of the thunder that they occur together, although the sound is caused by the bolt starting, not striking; moreover that the current of air travels faster than the bolt, and that consequently the object always is shaken and feels the blast before it is struck; and that nobody hit has ever seen the lightning or heard the thunder in advance. Flashes on the left are considered lucky, because the sun rises on the left-hand side of the firmament; and their approach is not so visible as their return, whether after the blow a fire springs from it or the breath returns when its work is done or its fire used up.

In making these observations the Tuscans divided the heaven into sixteen parts: the first quarter is from the North to the equinoctial sunrise (East), the second to the South, the third to the equinoctial sunset (West), and the fourth occupies the remaining space extending from West to North; these quarters they subdivided into four parts each, of which they called the eight starting from the East the left-hand regions and the eight opposite ones the right-hand. Of these the most formidable are those lying between West and North. Hence the line of approach and the line of retirement of thunderbolts is of very great importance. It is best for them to return to parts in the region of sunrise. Accordingly it will be a portent of supreme happiness when they come from the first part of the sky and retire to the same parta sign that history records to have been youchsafed to the dictator Sulla: but all the others are less fortunate or actually direful, in accordance with the division of the actual firmament where they occur. Some people think it wrong to give or to listen to reports of thunderbolts, except if they are told to a guest or a parent.

The great folly of paying attention to these occurrences was discovered when the Temple of Juno at Rome was struck by lightning in the time of Scaurus, who was afterwards head of the state.

Lightning unaccompanied by thunder occurs more often by night than in the daytime. Man is the one creature that is not always killed when struckall others are killed on the spot; nature doubtless bestows this honour on man because so many animals surpass him in strength. All things (when struck) fall in the opposite direction to the flash. A man does not die unless the force of the blow turns him right round. Men struck from above collapse. A man struck while awake is found with his eyes shut; while asleep, with them open. It is not lawful to cremate a man who loses his life in this manner; religious tradition prescribes burial. No living creature can be burnt by lightning without being killed. The temperature of the wound of those struck is lower than that of the rest of the body.

56. Among things that grow in the ground, it does not strike a laurel bush. It never penetrates more than five feet into the earth; consequently when in fear of lightning men think caves of greater depth are the safest, or else a tent made of the skin of the creatures called sea-calves, because that alone among marine animals lightning does not strike, just as it does not strike the eagle among birds; this is why the eagle is represented as armed with a thunderbolt as a weapon. In Italy in the time of the Caesarian war people ceased to build towers between Terracina and the Temple of Feronia, as every tower there was destroyed by lightning.

57. Besides these events in the lower sky, it is entered in the records that in the consulship of Manius Acilius and Gaius Porcius it rained milk and blood, and that frequently on other occasions there it has rained flesh, for instance in the consulship of Publius Volumnius and Servius Sulpicius, and that none of the flesh left unplundered by birds of prey went bad; and similarly that it rained iron in the district of Lucania the year before Marcus Crassus was killed a by the Parthians and with him all the Lucanian soldiers, of whom there was a large contingent in his army; the shape of the iron that fell resembled sponges; the augurs prophesied wounds from above. But in the consulship Lucius Paullus and Gaius Marcellus it rained wool in the vicinity of Compsa Castle, near which Titus Annius Milo was killed a year later. It is recorded in the

annals of that year that while Milo was pleading a case in court it rained baked bricks.

58. We are told that during the wars with the Cimbri a noise of clanging armour and the sounding of a trumpet were heard from the sky, and that the same thing has happened frequently both before then and later. In the third consulship of Marius the inhabitants of Ameria and Tuder [Todi] saw the spectacle of heavenly armies advancing from the East and the West to meet in battle, those from the West being routed. It has often been seen, and is not at all surprising, that the sky itself catches fire when the clouds have been set on fire by an exceptionally large flame.

59. The Greeks tell the story that Anaxagoras of Clazomenae in the 2nd year [467 BC] of the 78th Olympiad was enabled by his knowledge of astronomical literature to prophecy that in a certain number of days a rock would fall from the sun; and that this occurred in the daytime in the Goat's River district of Thrace (the stone is still shownit is of the size of a wagon-load and brown in colour), a comet also blazing in the nights at the time. If anyone believes in the fact of this prophecy, that involves his allowing that the divining powers of Anaxagoras covered a greater marvel, and that our understanding of the physical universe is annihilated and everything thrown into confusion if it is believed either that the sun is itself a stone or ever had a stone inside it. But it will not be doubted that stones do frequently fall. A stone is worshipped for this reason even at the present day in the exercising ground at Abydosone of moderate size, it is true, but which the same Anaxagoras is said to have prophesied as going to fall in the middle of the country. There is also one that is worshipped at Cassandria, the place that has been given the name of potidaea, and where a colony was settled on account of this occurrence. I myself saw one that had recently come down in the territory of the Vocontii.

60. The common occurrences that we call rainbows have nothing miraculous or portentous about them, for they do not reliably portend even rain or fine weather. The obvious explanation of them is that a ray of the sun striking a hollow cloud has its point repelled and is reflected back to the sun, and that the diversified colouring is due to the mixture of clouds, fires and air. Rainbows certainly do not occur except opposite to the sun, and never except in semi-circular shape, and not at night time, although Aristotle does state that a rainbow has been sometimes seen at night, though he also admits that it cannot happen except on the 14th day of the lunar month. Rainbows in winter occur chiefly when the day is drawing in after the autumnal equinox; when the day draws out again after the vernal equinox they do not occur, nor in the longest days about the solstice, but they occur frequently in midwinter; also they are high in the sky when the sun is low and low when it is high; and smaller but of wider breadth at sunrise or sunset, and narrow but of large circumference at midday. In summer they are not seen during midday, but after the autumn equinox they are seen at any hour; and never more than two are seen at once

61. I observe that the facts as to the other phenomena of the same kind are generally familiar: viz., that hail is produced from frozen rain and snow from the same fluid less solidly condensed, but hoar frost from cold dew; that snow fall during winter but not hail; and hail itself falls more often in the daytime than at night, and melts much faster than snow; that mists do not occur in summer nor in extremely cold weather, nor dew in frosty or very hot or windy weather, and only on fine nights; that liquid is reduced in bulk by freezing, and when ice is thawed the bulk produced is not the same; that variations of colour and shape are seen in the clouds in proportion as the fire mingled with them gains the upper hand or is defeated;

62. and moreover that particular places have particular special qualities: the nights of Africa are dewy in summer, in Italy rainbows are seen every day at Locri and at the Veine Lake, at Rhodes and Syracuse there is never such a thick curtain of cloud that the sun is not visible at some hour of the day. Such special features will be more suitably related in their places.

So much on the subject of the air.

63. Next comes the earth, the one division of the natural world on which for its merits we have bestowed the venerable title of mother. She belongs to men as the sky belongs to God: she receives us at birth, and gives us nurture after birth, and when once brought forth she upholds us always, and at the last when we have now been disinherited by the rest of nature she embraces us in her bosom and at that very time gives us her maternal shelter; sanctified by no service more than that whereby she makes us also sacred, even bearing our monuments and epitaphs and prolonging our name and extending our memory against the shortness of time; whose divinity is the last which in anger we invoke to lie heavy on those who are now no more, as though we did not know that she is the only element that is never wroth with man. Water rises in mist, freezes into hail, swells in waves, falls headlong in torrents; air becomes thick with clouds and rages with storms; but earth is kind and gentle and indulgent, ever a handmaid in the service of mortals, producing under our

compulsion, or lavishing of her own accord, what scents and savours, what juices, what surfaces for the touch, what colours! how honestly she repays the interest lent her! what produce she fosters for our benefit! since for living creatures that are noxious the breath of life is to blameshe is compelled to receive them when their seed is sown and to maintain them when they have been born: but their harm lies in the evils of those that generate them. When a serpent has stung a man she harbours it no more, and she exacts retribution even on the account of the helpless; she produces medicinal herbs, and is ever fertile for man's benefit; nay, even poisons she may be thought to have invented out of compassion for us, lest, when we were weary of life, hunger, the death most alien to earth's beneficence, should consume us with slow decay, lest precipices should scatter in fragments our lacerated body, lest departure it is seeking; lest if we sought death in the deep our burial should serve for fodder; lest the torture of the steel should cleave our body. So is it! in mercy did she generate the potion whereof the easiest draughtas men drink when thirstygifts might painlessly just blot us out, without injury to the body or loss of blood, in such wise that when dead no birds nor beasts should touch us, and one that had perished for himself should be preserved for the earth. Let us own the truth: what earth has produced as a cure for our ills, we have made into a deadly poison; why, do we not also put her indispensable gift of iron to a similar use? Nor yet should we have any right to complain even if she had engendered poison to serve the purpose of crime. In fact in regard to one of nature's elements we have no gratitude. For what luxuries and for what outrageous uses does she not subserve mankind? She is flung into the sea, or dug away to allow us to let in the channels. Water, iron, wood, fire, stone, growing crops, are employed to torture her at all hours, and much more to make her minister to our luxuries than our sustenance. Yet in order to make the sufferings inflicted on her surface and mere outer skin seem endurable, we probe her entrails, digging into her veins of gold and silver and mines of copper and lead; we actually drive shafts down into the depth to search for gems and certain tiny stones; we drag out her entrails, we seek a jewel merely to be worn upon a finger! How many hands are worn away with toil that a single knuckle may shine resplendent! If any beings of the nether world existed, assuredly even they would have been dug up ere now by the burrowings of avarice and luxury. And can we wonder if earth has also generated some creatures for our harm? since the wild animals, I well believe, are her guardians, and protect her from sacrilegious hands; do not serpents infest our mines, do we not handle veins of gold mingled with the roots of poison? Yet that shows the goddess all the kinder towards us, because all these avenues from which wealth issues lead but to crime and slaughter and warfare, and her whom we besprinkle with our blood we cover with unburied bones, over which nevertheless, when at length our madness has been finally discharged, she draws herself as a veil, and hides even the crimes of mortals

I would reckon this too among the crimes of our ingratitude, that we are ignorant of her nature.

64. But her shape is the first fact about which men's judgement agrees. We do undoubtedly speak of the earth's sphere, and admit that the globe is shut in between poles. Nor yet in fact do all these lofty mountains and widely spreading plains comprise the outline of a perfect sphere, but a figure whose circuit would produce a perfect sphere if the ends of all the lines were enclosed in a circumference. This is the consequence of the very nature of things, it is not due to the same causes as those we have adduced in the case of the heaven; for in the heaven the convex hollow converges on itself and from all sides rests upon its pivot, the earth, whereas the earth being a solid dense mass rises like an object swelling, and expands outward. The world converges to its centre, whereas the earth radiates outward from its centre, the ceaseless revolution of the world around her forcing her immense globe into the shape of a sphere.

65. Here there is a mighty battle between learning on one side and the common herd on the other: the theory being that human beings are distributed all round the earth and stand with their feet pointing towards each other, and that the top of the sky is alike for them all and the earth trodden under foot at the centre in the same way from any direction, while ordinary people enquire why the persons on the opposite side don't fall offjust as if it were not reasonable that the people on the other side wonder that we do not fall off. There is an intermediate theory that is acceptable even to the unlearned crowdthat the earth is of the shape of an irregular globe, resembling a pine cone, yet nevertheless is inhabited all round But what is the good of this theory when there arises another marvel, that the earth herself hangs suspended and does not fall and carry us with it? As if forsooth there were any doubt about the force of breath, especially when shut up inside the world, or as if it were possible for the earth to fall when nature opposes, and denies it any place to fall to For just as the sole abode of fires is in the element of fire, and of waters in water, and of breath in breath, so earth, barred out by all the other elements, has no place except in itself. Yet it is surprising that with this vast level expanse of sea and plains the resulting formation is a globe. This view has the support of Dicaearchus, a savant of the first rank, who with the support of royal patrons took the measurement of mountains, and published that the highest of them was Pelion, with an altitude of 1250 paces [above 6000 feet] inferring that this was no portion of the earth's general sphericity. To me this seems a questionable guess, as I know that some peaks of the Alps rise to a great height, not less than 50,000 paces.

But what the crowd most debates is if it must believe that the conformation of the waters also rises in a curve. Nevertheless nothing else in the natural world is more visibly manifest. For (1) hanging drops of liquid always take the shape of small round globes; (2) when dropped on dust or placed on the downy surface of leaves they are seen to be absolutely spherical; (3) in goblets when filled the surface curves upward most at the centre, though owing to the transparency of the liquid and its fluidity tending to find its own level this is more easily discovered by theory than by observation; and (4) a still more remarkable fact is that when a very little additional liquid is poured into a cup that has already been filled the surplus overflows, but the opposite happens when weighty solids, often as many as 20 coins, are put into it, presumably because these pass inside the liquid and raise its surface to a peak, whereas liquids poured on to the upward curving surface slip off. (5) The same cause explains why the land is not visible from the deck of a ship when in sight from the masthead; and why as a vessel passes far into the distance, if some shining object is tied to the top of the mast it appears slowly to sink and finally it is hidden from sight. Lastly (6) what other conformation could have caused the ocean, which we acknowledge to be at the extreme outside, to cohere and not fall away, if there is no boundary beyond to enclose it? The very question as to how, although the sea is globular in shape, its edge does not fall away, itself ranks with the marvellous. On the other side the Greek investigators, greatly to their delight and to their glory, prove by subtle mathematical reasoning that it cannot possibly be the case that the seas are really flat and have the shape that they appear to have. For, they argue, while it is the ease that water travels downward from an elevation, and this is its admitted nature, and nobody doubts that the water on any coast has reached the farthest point allowed by the slope of the earth, it is manifest beyond doubt that the lower an object is the nearer it is to the centre of the earth, and that all the lines drawn from the centre to the nearest bodies of water are shorter than those drawn from the edge of these waters to the farthest point in the sea: it therefore follows that all the water from every direction converges towards the centre, this pressure inward being the cause of its not falling off.

66. The reason for this formation must be thought to be the inability of earth when absolutely dry to cohere of itself and without moisture, and of water in its turn to remain still without being held up by earth; the intention of the Artificer of nature must have been to unite earth and water in a mutual embrace, earth opening her bosom and water penetrating her entire frame by means of a network of veins radiating within and without, above and below, the water bursting out even at the tops of mountain ridges, to which it is driven and squeezed out by the weight of the earth, and spurts out like a jet of water from a pipe, and is so far from being in danger of falling down that it leaps upward to all the loftiest elevations. This theory shows clearly why the seas do not increase in bulk with the daily accession of so many rivers. The consequence is that the earth at every point of its globe is encircled and engirdled by sea flowing round it, and this does not need theoretical investigation, but has already been ascertained by experience.

67. Today the whole of the West is navigated from Cadiz and the Straits of Gibraltar all round Spain and France. But the larger part of the Northern Ocean was explored under the patronage of his late Majesty Augustus, when a fleet sailed round Germany to the promontory of the Cimbri, and thence seeing a vast sea in front of them or learning of it by report, reached the region of Scythia and localities numb with excessive moisture. On this account it is extremely improbable that there is no sea in those parts, as there is a superabundance of the moist element there. But next, on the Eastward side, the whole quarter under the same star stretching from the Indian Ocean to the Caspian Sea was navigated throughout by the Macedonian forces in the reigns of Seleucus and Antiochus, who desired that it should be called both Seleucis and Antiochis after themselves. And many coasts of Ocean round the Caspian have been explored, and very nearly the whole of the North has been completely traversed from one side to the other by galleys, so that similarly also there is now overwhelming proof, leaving no room for conjecture, of the existence of the Maeotic Marsh, whether it be a gulf of that Ocean as I notice many have believed or an overflow from it from which it is separated off by a narrow space. On the other side of Cadiz, from the same Western point, a great part of the Southern gulf is navigated today in the circuit of Mauretania. Indeed the greater part of it Alexander the Great's eastern conquests also explored as far as the Arabian gulf; in which,

when Augustus's son Gaius Caesar was operating there, it is said that figureheads of ships from Spanish wrecks were identified. Also when the power of Carthage flourished, Hanno sailed round from Cadiz to the extremity of Arabia and published a memoir of his voyage, as did Himileo when despatched at the same date to explore the outer coasts of Europe. Moreover we have it on the authority of Cornelius Nepos that a certain contemporary of his named Eudoxus when flying from King Lathvrus emerged from the Arabian Gulf and sailed right round to Cadiz; and much before him Caelius Antipater states that he had seen someone who had gone on a trading voyage from Spain to Ethiopia. Nepos also records as to the northern circuit that Quintus Metellus Celer, colleague of Afranius in the consulship hut at the time proconsul of Gaul, received from the King of the Swabians a present of some Indians, who on a trade voyage had been carried off their course by storms to Germany. Thus there are seas encircling the globe on every side and dividing it in two, so robbing us of half the world since there is no region affording a passage from there to here or from here to there. This reflexion serves to expose the vanity of mortals, and appears to demand that I should display to the eye and exhibit the extent of this whole indefinite region in which men severally find no satisfaction.

68. In the first place it is apparently reckoned as forming one half of the globejust as if no part were cut off for the ocean itself, which surrounding and encircling the whole of it, and pouring forth and reabsorbing the waters and pasturing and all the moisture that goes to form the clouds, the stars themselves with all their numbers and their mighty size, can be supposed to occupy a spaceof what extent, pray? The freehold owned by that mighty climatic mass is bound to be enormous without limit! Add that of what is left more than half is taken by the sky. For this has five divisions called zones, and all that lies beneath the two outermost zones that surround the poles at either endboth the pole named from the Seven Oxen and the one opposite to it called after Austeris all crushed under cruel frost and everlasting cold. In both regions perpetual mist prevails, and a light that the invisibility of the milder stars renders niggardly and that is only white with hoarfrost. But the middle portion of the lands, where the sun's orbit is, is scorched by its flames and burnt up by the proximity of its heat: this is the torrid zone. There are only two temperate zones between the torrid one and the frozen ones, and these have no communication with each other because of the fiery heat of the heavenly body.

Thus the sky has stolen three quarters of the earth. The extent of the trespass of ocean is unascertained; but even the one portion left to us suffers perhaps an even greater loss, inasmuch as the same ocean, spreading out, as we shall describe, into a number of bays, advances with its threatening roar so close to the inner seas that there is only a distance of 115 miles between the Arabian Gulf and the Egyptian Sea and of 375 between the Caspian and the Black Sear; and also with its inner channels through so many seas whereby it sunders Africa, Europe and Asia, it occupieswhat area of the land? Calculate moreover the dimensions of all those rivers and vast swamps, add also the lakes and pools, and next the ridges too that rise into the heaven and are precipitous even to the eye, next the forests and steep glens, and the deserts and areas for a thousand reasons left deserted; subtract all these portions from the earth or rather from this pinprick, as the majority of thinkers have taught, in the world--for in the whole universe the earth is nothing else: and this is the substance of our glory, this is its habitation, here it is that we fill positions of power and covet wealth, and throw mankind into an uproar, and launch even civil wars and slaughter one another to make the land more spacious! And to pass over the collective insanities of the nations. this is the land in which we expel the tenants next to us and add a spade-full of turf to our own estate by stealing from our neighbour'sto the end that he who has marked out his acres most widen and banished his neighbours beyond all record may rejoice in owning--how small a fraction of the earth's surface? or, when he has stretched his boundaries to the full measure of his avarice, may still retain what portion, pray, of his estate when he is dead?

69. That the earth is at the centre of the universe is proved by irrefragable arguments, but the clearest is the equal hours of day and night at the equinox. For if the earth were not at the centre, it can be realized that it could not have the days and nights equal; and binoculars confirm this very powerfully, since at the season of the equinox sunrise and sunset are seen on the same line, whereas sunrise at midsummer and sunset at midwinter fall on a line of their own. These things could not occur without the earth's being situated at the centre.

70. But the three circles intertwined between the zones aforesaid are the cause of the differences of the seasons: the Tropic of Cancer on the side of the highest part of the zodiac to the northward of us, and opposite to it the Tropic of Capricorn towards the other pole, and also the equator that runs in the middle circuit of the zodiac.

71. The cause of the remaining facts that surprise us is found in the shape of the earth itself, which together with the waters also the same arguments prove to resemble a globe.

For this is undoubtedly the cause why for us the stars of the northern region never set and their opposites of the southern region never rise, while on the contrary these northern stars are not visible to the antipodes, as the curve of the earth's globe bars our view of the tracts between. Cave-dweller Country [Abyssinia/Somaliland] and Egypt which is adjacent to it do not see the Great and Little Bear, and Italy does not see Canopus and the constellation called Berenice's Hair, also the one that in the reign of his late Majesty Augustus received the name of Caesar's Throne, constellations that are conspicuous there. And so clearly does the rising vault curve over that to observers at Alexandria Canopus appears to be elevated nearly a quarter of one sign above the earth, whereas from Rhodes it seems practically to graze the earth itself, and on the Black Sea, where the North Stars are at their highest, it is not visible at all. Also Canopus is hidden from Rhodes, and still more from Alexandria; in Arabia in November it is hidden during the first quarter of the night and shows itself in the second; at Meroe it appears a little in the evening at midsummer and a few days before the rising of Areturus is seen at daybreak. These phenomena are most clearly disclosed by the voyages of those at sea, the sea sloping upward in the direction of some and downward in the direction of others, and the stars that were hidden behind the curve of the ball suddenly becoming visible as it were rising out of the sea. For it is not the fact, as some have said, that the world rises up at this higher poleor else these stars would be visible everywhere; but these stars are believed to be higher the nearer people are to them, while they seem low to those far away, and just as at present this pole seems lofty to those situated on the declivity, so when people pass across to yonder downward slope of the earth those stars rise while the ones that here were high sink, which could not happen except with the conformation of a ball.

72. Consequently inhabitants of the East do not perceive evening eclipses of the sun and moon, nor do those dwelling in the West see morning eclipses, while the latter see eclipses at midday later than we do. The victory of Alexander the Great is said to have caused an eclipse of the moon at Arbela at 8 p.m. while the same eclipse in Sicily was when the moon was just rising. An eclipse of the sun that occurred on April 30 in the consulship [59 AD] of Vipstanus and Fonteius a few years ago was visible in Campania between 1 and 2 p.m. but was reported by Corbulo commanding in Armenia as observed between 4 and 5: this was because the curve of the globe discloses and hides different phenomena for different localities. If the earth were flat, all would be visible to all alike at the same time; also the nights would not vary in length, because corresponding periods of 12 hours would be visible equally to others than those at the equator, periods that as it is do not exactly correspond in every region alike.

73. Consequently also although night and day are the same thing all over the world, it is not night and day at the same time all over the world, the intervention of the globe bringing night or its revolution day. This has been discovered by many experimentsthat of Hannibal's towers in Africa and Spain. and in Asia when piratical alarms prompted the precaution of watchtowers of the same sort, warning fires lit on which at noon were often ascertained to have been seen by the people farthest to the rear at 9 p.m. Alexander above mentioned had a runner named Philonides who did the 1200 stades from Sicvou to Elis in 9 hours from sunrise and took till 9 p.m. for the return journey, although the way is downhill; this occurred repeatedly. The reason was that going his way lay with the sun but returning he was passing the sun as it met him travelling in the opposite direction. For this reason ships sailing westward beat even in the shortest day the distances they sail in the nights, because they are going with the actual sun.

74. Travellers' sundials are not the same for reference everywhere, because the shadows thrown by the sun as they alter alter the readings at every 300 or at farthest 500 stades. Consequently in Egypt at midday on the day of the equinox the shadow of the pin or 'gnomon' measures a little more than half the length of the gnomon itself, whereas in the city of Rome the shadow is 1/9th shorter than the gnomon, at the town of Ancona 1/35th longer, and in the district of Italy called Venezia the shadow is equal to the gnomon, at the same hours.

75. Similarly it is reported that at the town of Syene, 5000 stades South of Alexandria, at noon in midsummer no shadow is cast, and that in a well made for the sake of testing this the light reaches to the bottom, clearly showing that the sun is vertically above that place at the time; and this is stated in the writings of Onesicritus also to occur at the same time in India South of the river Hypasis. It is also stated that in the Cavedwellers' city of Berenice, and 4820 stades away at the town of Ptolemais in the same tribe, which was founded on the shore of the Red Sea for the earliest elephant hunts, the same thing occurs 45 days before and 45 days after midsummer, and during that period of 90 days the shadows are thrown southward. Again in Meroethis is an inhabited island in the river Nile 5000 stades from Syene, and is the capital of the retention.

sun is in the 18th degree of Taurus and in the 14th of Leo. There is a mountain named Maleus in the Indian tribe of the Oretes, near which shadows are thrown southward in summer and northward in winter; the northern constellation is visible there on only 15 nights. Also in India at the well-known port of Patala the sun rises on the right and shadows fall southward. It was noticed when Alexander was staying at this place that the Great and Little Bears were visible only in the early part of the night. Alexander's guide Onesicritus wrote that this constellation is not visible at the places in India where there are no shadows, and that these places are called Shadeless, and no reckoning is kept of the hours there.

76. But according to Eratosthenes in the whole of Cavedweller Country on 90 days once a year shadows fall the wrong way.

77. Thus it comes about that owing to the varied lengthening of daylight the longest day covers 12 8/9 equinoctial hours at Merce, but 14 hours at Alexandria, 15 in Italy, and 17 in Britain, where the light nights in summer substantiate what theory compels us to believe, that, as on summer days the sun approaches nearer to the top of the world, owing to a narrow circuit of light the underlying parts of the earth have continuous days for 6 months at a time, and continuous nights when the sun has withdrawn in the opposite direction towards winter. Pytheas of Marseilles writes that this occurs in the island of Thule, 6 days' voyage N. from Britain, and some declare it also to occur in the Isle of Anglesea, which is about 200 miles from the British town of Colchester.

78. This theory of shadows and the science called gnomonics was discovered by Anaximenes of Miletus, the pupil of Anaximander of whom we have spoken; he first exhibited at Sparta the time-piece they call 'Hunt-the-Shadow.'

79. The actual period of a day has been differently kept by different people: the Babylonians count the period between two sunrises, the Athenians that between two sunsets, the Umbrians from midday to midday, the common people verywhere from dawn to dark, the Roman priests and the authorities who fixed the official day, and also the Egyptians and Hipparchus, the period from midnight to midnight. But it is obvious that the breaks in daylight between sunset and sunrise are smaller near the solstice than at the equinoxes, because the position of the zodiac is more slanting around its middle points but straighter near the solstice.

80. We must deal next with the results connected with these heavenly causes. For it is beyond question that the Ethiopians are burnt by the heat of the heavenly body near them and are born with a scorched appearance, with curly beard and hair. and that in the opposite region of the world the races have white frosty skins, with yellow hair that hangs straight; while the latter are fierce owing to the rigidity of their climate but the former wise because of the mobility of theirs; and their legs themselves prove that with the former the juice is called away into the upper portions of the body by the nature of heat. while with the latter it is driven down to the lower parts by falling moisture; in the latter country dangerous wild beasts are found, in the former a great variety of animals and especially of birds; but in both regions men's stature is high, owing in the former to the pressure of the fires and in the latter to the nourishing effect of the damp; whereas in the middle of the earth, owing to a healthy blending of both elements, there are tracts that are fertile for all sorts of produce, and men are of medium bodily stature, with a marked blending even in the matter of complexion; customs are gentle, senses clear, intellects fertile and able to grasp the whole of nature; and they also have governments, which the outer races never have possessed, any more than they have ever been subject to the central races, being quite detached and solitary on account of the savagery of the nature that broods over those regions.

81. The theory of the Babylonians deems that even earthquakes and fissures in the ground are caused by the force of the stars that is the cause of all other phenomena, but only by that of those three stars to which they assign thunderbolts; and that they occur when these are travelling with the sun or are in agreement with him, and particularly about the quadratures of the world. On this subject a remarkable and immortal inspiration is attributed (if we can believe it) to the natural philosopher Anaximander of Miletus, who is said to have warned the Spartans to be careful of their city and buildings, because an earthquake was impending; and subsequently the whole of their city collapsed, and also a large part of Mount Taygetus projecting in the shape of a ship's stern broke off and crashing down on it added to the catastrophe. Also another conjecture is attributed to Pherecydes the teacher of Pythagoras, this also inspired: he is said to have forefold to his fellow-citizens an earthquake of which he had obtained a premonition in drawing water from a well. Assuming the truth of these stories, how far pray can such men even in their lifetime be thought to differ from a god? And though these matters may be left to the estimation of individual judgment; I think it indubitable that their cause is to be attributed to the winds: for tremors of the earth never

occur except when the sea is calm and the sky so till that birds are unable to soar because all the Breath that carries them has been withdrawn; and never except after wind, doubtless because then the blast has been shut up in the veins and hidden bob lows of the sky. And a trembling in the earth is not different from a thunderclap in a cloud, and a fissure is no different from when an imprisoned current of air by struggling and striving to go forth to freedom causes a flash of lightning to burst out.

82. Consequently earthquakes occur in a variety of ways, and cause remarkable consequences, in some places overthrowing walls, in others drawing them down into a gaping cleft, in others thrusting up masses of rock, in others sending out rivers and sometimes even fires or hot springs, in others diverting the course of rivers. They are however preceded or accompanied by a terrible sound, that sometimes resembles a rumble, sometimes the lowing of cattle or the shouts of human beings or the clash of weapons struck together, according to the nature of the material that receives the shock and the shape of the caverns or burrows through which it passes, proceeding with smaller volume in a narrow channel but with a harsh noise in channels that bend, echoing in hard channels, bubbling in damp ones, forming waves in stagnant ones, raging against solid ones. Accordingly even without any movement occurring a sound is sometimes emitted. And sometimes the earth is not shaken in a simple manner but trembles and vibrates. Also the gap sometimes remains open, showing the objects that it has sucked in, while sometimes it hides them by closing its mouth and drawing soil over it again in such a way as to leave no traces; it being usually cities that are engulfed, and a tract of farmland swallowed, although seaboard districts are most subject to earthquakes, and also mountainous regions are not free from disaster of the kind: I have ascertained that tremors have somewhat frequently occurred in the Alps and Apennines.

Earthquakes are more frequent in autumn and spring, as is lightning. Consequently the Gallic provinces and Egypt suffer very little from them, as in the latter the summer is the cause that prevents them and in the former the winter. Similarly they are more frequent by night than in the daytime. The severest earthquakes occur in the morning and the evening, but they are frequent near dawn and in the daytime about noon. They also occur at an eclipse of the sun or moon, since then storms are lulled, but particularly when heat follows rain or rain heat.

83. Sailors at sea can also anticipate an earthquake and forecast it with certainty when a sudden wave swells up without there being a wind, or a shock shakes the vessel. Even in ships posts begin to tremble just as they do in buildings, and foretell an earthquake by rattling; nay more, birds of timid kinds perch on the rigging. There is also a sign in the sky: when an earthquake is impending, either in the daytime or a little after sunset, in fine weather, it is preceded by a thin streak of cloud stretching over a wide space.

84. Another sign is when the water in wells is muddier and has a somewhat foul smell, just as in wells there is also a remedy for earthquake such as frequently caves too afford, as they supply an outlet for the confined breath. This is noticed in whole towns: buildings pierced by frequent conduits for drainage are less shaken, and also among these the ones erected over vaults are much saferas is noticed in Italy at Naples, the solidly built portion of the city being specially liable to collapses of this nature. The safest parts of buildings are arches, also angles of walls, and posts, which swing back into position with each alternate thrust; and walls built of clay bricks suffer less damage from being shaken. There is also a great difference in the actual kind of movement, as the earth shakes in several ways; there is least danger when it quivers with a trembling rattle of the buildings, and when it rises in a swell and settles back again, with an alternating motion; also no harm is done when buildings collide and ram against each other, as the one motion counteracts the other. A waving bend and a sort of billowy fluctuation is dangerous, or when the whole movement drives in one direction. Earthquakes stop when the wind has found an outlet, or else, if they go on, they do not stop before forty days, and usually even longer. some in fact having gone on for one or two years' time.

85. I find in the books of the lore of Tuscany that once a vast and portentous earthquake occurred in the district of Modena; this was during the consulship of Lucius Marcius and Sextus Julius. Two mountains ran together with a mighty crash, leaping forward and then retiring with flames and smoke rising between them to the sky; this took place in the daytime, and was watched from the Aemilian road by a large crowd of Knights of Rome with their retinues and passers by. The shock brought down all the country houses, and a great many animals in the buildings were killed. It was in the year before the Allies' War, which was perhaps more disastrous to the land of Italy than the civil wars. Our generation also experienced a not less marvellous manifestation in the last year of the Emperor Nero, as we have set forth in our history of his principate: meadows and olive trees with a public road running between then got over to the opposite sides of the road; this took place in the Marrucinian territory, on the

lands of Vettius Marcellus, Knight of Rome, Nero's estate-manager.

86. Earthquakes are accompanied by inundations of the sea, which is presumably caused to flood the land by the same current of air, or drawn into the bosom of the earth as it subsides. The greatest earthquake in human memory occurred when Tiberius Caesar was emperor, twelve Asiatic cities being overthrown in one night; the most numerous series of shocks was during the Punic War, when reports reached Rome of fifty-seven in a single year; it was the year when a violent earthquake occurring during an action between the Carthaginian and Roman armies at Lake Trasimene was not noticed by the combatants on either side. Nor yet is the disaster a simple one, nor does the danger consist only in the earthquake itself, but equally or more in the fact that it is a portent; the city of Rome was never shaken without this being a premonition of something about to happen.

87. The cause of the birth of new lands is the same, when that same breath although powerful enough to cause an upheaval of the soil has not been able to force an exit. For lands are born not only through the conveyance of soil by streams (as the Echinades Islands when heaped up from the river Achelous and the greater part of Egypt from the Nilethe crossing from the island of Pharos to the coast, if we believe Homer, having formerly taken twenty-four hours) or by the retirement of the sea as once took place at Circei; such a retirement is also recorded to have occurred to a distance of 10,000 paces in the harbour of Ambracia, and to a distance of 5,000 at the Athenian port of Piraeus: and at Ephesus, where once the sea used to wash up to the temple of Diana. At all events if we believe Herodotus, there was sea above Memphis as far as the mountains of Ethiopia and also towards the plains of Arabia, and sea round Ilium, and over the whole territory of Teuthras and where the Maeander has spread prairie-land.

88. New lands are also formed in another way, and suddenly emerge in a different sea, nature as it were balancing accounts with herself and restoring in another place what an earthquake has engulfed.

89. The famous islands of Delos and Rhodes are recorded in history as having been born from the sea long ago, and subsequently smaller ones, Anaphe beyond Melos, Neae between Lemons and the Dardanelles, Halone between Lebedos and Teos, Thera and Therasia among the Cyclades in the 4th year of the 145th Olympiad; also in the same group Hiera, which is the same as Automate, 130 years later; and 2 stades from Hiera, Thia 110 years later, in our age, on July 8 in the year of the consulship of Marcus Junius Silanus and Lucius Balbus.

Before our time also among the Aeolian Islands near Italy, as well as near Crete, there emerged from the sea one island 2500 paces long, with hot springs, and another in the 3rd year [126 BC] of Olympiad 163 in the bay of Tuscany, this one burning with a violent blast of air; and it is recorded that a great quantity of fish were floating round it, and that people who ate of them immediately expired. So also the Monkey Islands are said to have risen in the bay of Campania, and later one among them, Mount Epopos, is said to have suddenly shot up a great flame and then to have been levelled with the surface of the plain. In the same plain also a town was sucked down into the depths, and another earthquake caused a swamp to emerge, and another overturned mountains and threw up the island of Procida.

90. For another way also in which nature has made islands is when she tore Sicily away from Italy, Cyprus from Syria, Euboea from Boeotia, land. Atalantes and Macrias from Enboea, Besbicus from Bithynia, Leucosia from the Sirens' Cape.

91. Again she has taken islands away from the sea and joined them to the landAntissato Lesbos, Zephyrius to Halicarnassus, Aethusa to Myndus, Dromiscos and Pernes to Miletus, Narthecusa to Cape Parthenius. Hybanda, once an Ionian island, is now 25 miles distant from the sea, Ephesus has Syria as part of the mainland, and its neighbour Magnesia the Derasides and Sapphonia. Epidaurus and Oricum have ceased to be islands.

92. Cases of land entirely stolen away by the first of all (if we accept Plato's story [Tim. 24 E]), the vast area covered by the Atlantic, and next, in the inland seas also, the areas that we see submerged at the present day, Acarnania covered by the Ambracian Gulf, Achaea by the Gulf of Corinth, Europe and Asia by the Sea of Marmora and the Black Sea. Also the sea has made the channels of Leucas, Antirrhium, the Dardanclles and the Wo Bospori.

93. And to pass over bays and marshes, the earth is eaten up by herself. She has devoured the highest mountain in Caria, Cibotus, together with the town of that name, Sipylus in Magnesia, and previously the very celebrated city in the same place that used to be called Tantalis, the territories of Galene and Galame in Phoenicia with the cities themselves, and the loftiest mountain range in Ethiopia, Phegiumjust as if the coasts also did not treacherously encroach!

94. The Black Sea has stolen Pyrra and Antissa in the neighbourhood of Lake Maeotis, the Gulf of Corinth Helice

and Bura, traces of which are visible at the bottom of the water. The sea suddenly snatched away more than 30,000 paces together with most of the human beings from the Island of Ceos, and half the city of Tyndaris in Sicily, and all the gap in the coast of Italy, and similarly Eleusis in Boeotia.

95. For let earthquakes not be mentioned, and every case where at least the tombs of cities survive, and at the same time let us tell of the marvels of the earth rather than the crimes of nature. And, I will swear, not even the heavenly phenomena could have been more difficult to recount: the wealth of mines so varied, so opulent, so prolific, brought to the surface in so many ages, although every day all over the world so much devastation is wrought by fires, collapse of buildings, shipwrecks, wars, frauds, and so great is the consumption of luxury and of the multitudes of mankind; such a variety of patterned gems, such many-coloured markings in stones, and among them the brilliance of a certain stone a that only allows actual daylight to penetrate through it; the profusion of medicinal springs; the flames of fire flickering up in so many places, unceasing for so many centuries; the lethal breaths either emitted from chasms or due to the mere formation of the ground, in some places fatal only to birds, as in the region of Soracte near Rome, in others to all living creatures except man, and sometimes to man also, as in the territory of Sinuessa and of Pozzuolithe places called breathing holes, or by other people jaws of hellditches that exhale a deadly breath; also the place near the Temple of Mephitis at Ampsanctus in the Hirpinian district, on entering which people die: likewise the hole at Hierapolis in Asia. harmless only to the priest of the Great Mother; elsewhere prophetic caves, those intoxicated by whose exhalations foretell the future, as at the very famous oracle at Delphi. In these matters what other explanation could any mortal man adduce save that they are caused by the divine power of that nature which is diffused throughout the universe, repeatedly bursting out in different ways?

96. In some places, the earth trembles when trodden on--for instance in the Gabii district not from the city of Rome about 200 acres shake when horsemen gallop over them, and similarly in the Reate district. Certain islands are always afloat, as in the districts of Caecubum and of Reate mentioned above and Modena and Statonium, and in Lake Vadimo, the dense wood near the springs of Cutilia which is never to be seen in the same place by day and by night, the islands in Lydia named the Reed Islands which are not only driven by the winds, but can be punted in any direction at pleasure with poles, and so served to rescue a number of the citizens in the Mithridatic war. There are also small islands at Nymphaeum called the Dancing Islands, because they move to the footbeats of persons keeping time with the chanting of a choral song. On the great lake of Tarqainii in Italy two islands float about carrying woods, their outline as the winds drive them forward now forming the shape of a triangle and now of a circle, but never a square.

97. Paphos possesses a famous shrine of Venus on a certain court in which rain does not fall, and the same in the case round an image of Minerva at the town of Nea in the Troad; in the same town also sacrifices left over do not go bad.

98. Near the town of Harpasa in Asia stands a jagged rock that can be moved with one finger, but that also resists a push made with the whole body. On the peninsula of Tanri in the state of Parasinum there is some earth which heals all wounds. But in the neighbourhood of Assos in the Troad a stone is produced that causes all bodies to waste away; it is called the Flesh-eater. There are two mountains near the river Indus, the nature of one of which is to hold all iron and that of the other to reject it; consequently if a man has nails in his shoes, on one of the mountains at each step he is unable to tear his foot away from the ground and on the other he cannot set it down on the ground. It is recorded that at Locri and Croton there has never been a plague or earthquake, and that in Lycia an earthquake is always followed by forty days' fine weather. Corn sown in the Arpi district does not come up, and at Mncian Altars in the district of Veil and at Tuscumin and in the Ciminian Forest there are places where stakes driven into the ground cannot be pulled out. Hay grown in the Crustninium district is noxious on the spot but healthy when conveyed elsewhere.

99. About the nature of bodies of water a great deal has been said. But the rise and fall of the tides of the sea is extremely mysterious, at all events in its irregularity; however the cause lies in the sun and moon. Between two risings of the moon there are two high and two low tides every 24 hours, the tide first swelling as the world moves upward with the moon, then falling as it slopes from the midday summit of the sky towards sunset, and again coming in as after sunset the world goes below the earth to the lowest parts of the heaven and approaches the regions opposite to the meridian, and from that point sucking back until it rises again; and never flowing back at the same time as the day before, just as if gasping for breath as the greedy star draws the seas with it at a draught and constantly rises from another point than the day before; yet returning at equal intervals and in every six hours, not of each day or night or place but equinoctial hours,

Copyright © 2018 by Lord Henfield, Guildford Scientific Press PAGE 3432 so that the tidal periods are not equal by the space of ordinary hours whenever the tides occupy larger measures of either diurnal or nocturnal hours, and only equal everywhere at the equinox. It is a vast and illuminating proof, and one of even divine utterance, that those are dull of wit who deny that the same stars pass below the earth and rise up again, and that they present a similar appearance to the lands and indeed to the whole of nature in the same processes of rising and setting, the course or other operation of a star being manifest beneath the earth in just the same way as when it is travelling past our eves.

Moreover, the lunar difference is manifold, and to begin with, its period is seven days: inasmuch as the tides, which are moderate from new moon to half-moon, therefrom rise higher and at full moon are at their maximum; after that they relax. at the seventh day being equal to what they were at first; and they increase again when the moon divides on the other side, at the union of the moon with the sun being equal to what they were at full moon. When the moon is northward and retiring further from the earth the tides are gentler than when she has swerved towards the south and exerts her force at a nearer angle. At every eighth year the tides are brought back at the hundredth circuit of the moon to the beginnings of their motion and to corresponding stages of increase. They make all these increases owing to the yearly influences of the sun, swelling most at the two equinoxes and more at the autumn than the spring one, but empty at midwinter and more so at midsummer. Nevertheless this does not occur at the exact points of time I have specified, but a few days after, just as it is not at full or new moon but afterwards, and not immediately when the world shows or hides the moon or slopes it in the middle quarter, but about two equinoctial hours later, the effect of all the occurrences in the sky reaching the earth more slowly than the sight of them, as is the case with lightning, thunder and thunderbolts.

But all the tides cover and lay bare greater spaces in the ocean than in the rest of the sea, whether because it is more furious when moved in its entirety than when in part, or because the open extent feels the force of the star when it marches untrammelled with more effect, whereas narrow spaces hinder the force, which is the reason why neither lakes nor rivers have tides like the ocean (Pytheas of Marseilles states that north of Britain the tides rise 120 ft.) But also the more inland seas are shut in by land like the water in a harbour; yet a more untrammelled expanse is subject to the tidal sway, inasmuch as there are several instances of people making the crossing from Italy to Utica in two days in a calm sea and with no wind in the sails when a strong tide was running. But these motions are observed more round the coasts than in the deep sea, since in the body too the extremities are more sensitive to the pulse of the veins, that is of the breath. But in most estuaries owing to the different risings of the stars in each region the tides occur irregularly, varying in time though not in method, as for instance in the Svrtes.

100. And nevertheless some tides have a special nature, for instance the channel at Taormina that ebbs and flows more frequently, and the one at Euboea that has seven tides in twenty-four hours. The tide at Buboea stops three times a month, on the seventh, eighth and ninth day after the new moon. At Cadiz the spring nearest the shrine of Hercules, which is enclosed like a well, sometimes rises and sinks with the ocean and sometimes does both at the contrary periods; a second spring in the same place agrees with the motions of the ocean.

There is a town on the banks of the Guadalquivir whose wells sink when the tide rises and rise when it falls, remaining stationary in the intervening periods. At Seville there is one well in the actual town that has the same nature, though all the others are as usual. The Black Sea always flows out into the Sea of Marmorathe tide never sets inward into the Black Sea.

101. All seas excrete refuse at high tide, some also periodically. In the neighbourhood of Messina and Mylae scum resembling dung is spat out on to the shore, which is the origin of the story that this is the place where the Oxen of the Sun are stalled. To this (so that I may leave out nothing that is within my knowledge) Aristotle adds that no animal dies except when the tide is ebbing. This has been widely noticed in the Gallic Ocean, and has been found to hold good at all events in the case of man.

102. This is the source of the true conjecture that the moon is rightly believed to be the star of the breath, and that it is this star that saturates the earth and fills bodies by its approach and empties them by its departure; and that consequently shells increase in size as the moon waxes, and that its breath is specially felt by bloodless creatures, but also the blood even of human beings increases and diminishes with its light; and that also leaves and herbage (as will be stated in the proper place) are sensitive to it, the same force penetrating into all things.

103. Consequently liquid is dried by the heat of the sun, and we are taught that this is the male star, which scorches and sucks up everything; and that in this way the flavour of salt is boiled into the wide expanse of the sea, either because the sweet and liquid, which is easily attracted by fiery force, is drawn out of it, but all the harsher and denser portion is left (this being why in a calm sea the water at a depth is sweeter than that at the top, this being the truer explanation of its harsh flavour, rather than because the sea is the ceaseless perspiration of the land), or because the sate is the ceaseless perspiration of the land), or because the nature of the earth stains the waters as if they were drugged. One instance is that when Dionysius the tyrant of Sicily was expelled from that position, he encountered the portent that on one day the sea-water in the harbour became fresh water.

104. The moon on the contrary is said to be a feminine and soft star, and to disengage moisture at night and attract, not remove it. The proof given for this is that the moon by her aspect melts the bodies of wild animals that have been killed and causes them to putrefy, and that when people are fast asleep she recalls the torpor and collects it into the head, and thaws ice, and unstiffens everything with moistening breath: thus (it is said) nature's alternations are held in balance, and there is always a supply, some of the stars drawing the elements together while others scatter them. But the nutriment of the moon is stated to be contained in bodies of fresh water as that of the sun is in seawater.

105. According to the account of Fabianus, the deepest sea has a depth of nearly two miles. Others report an immense depth of water (called the Black Sea Deeps) off the coast of the Coraxi tribe on the Black Sea, about 37 miles from land, where soundings have never reached bottom.

106. This is rendered more remarkable by springs of fresh water bubbling out as if from pipes on the seashore. In fact the nature of water also is not deficient in marvels. Patches of fresh water float on the surface of the sea, being doubtless lighter. Consequently also seawater being of a heavier nature gives more support to objects floating upon it. But some fresh waters too float on the surface of others: cases are the river carried on the surface of Lake Fucino, the Adde on the Lake of Como, the Ticino on Maggiore, the Mincio on Garda, the Ohio on Lago d'Iseo, the Ithone on the Lake of Geneva (the last north of the Alps, but all the rest in Italy), after a passing visit that covers many miles carrying out their own waters only and no larger quantity than they introduced. This has also been stated in the case of the river Orontes in Syria and many others. But some rivers so hate the sea that they actually flow underneath the bottom of it, for instance the spring Arethusa at Syracuse, in which things emerge that have been thrown into the Alpheus which flows through Olympia and reaches the coast in the Peloponnese. Instances of rivers that flow under ground and come to the surface again are the Lycus in Asia, the Erasmus in the Argolid and the Tigris in Mesopotamia; and obj ects thrown into the Spring of Aesculapius at Athens are given back again in Phaleron Harbour. Also a river that goes underground in the Plain of Atinas comes out 20 miles further on, as also does the Timavus in the district of Aquileia. In Lake Asphaltis in Judea. which produces bitumen, nothing can sink, and also in the Aretissa in Greater Armenia; the latter indeed is a nitrous lake that supports fish. A lake near the town of Manduria in the Salentine district is full to the brim, and is not reduced when water is drawn out of it nor increased when water is poured into it. In the river of the Cicones and in the Veline Lake of Picenum, wood thrown into the water gets covered with a film of stone, and in the river Surius in Colchis this goes so far that the stone in most cases is covered with bark still lasting. Similarly in the Sele beyond Sorrento not only twigs but also leaves immersed in the river become petrified, though apart from this its water is healthy to drink. Rock forms in the outlet of the marsh at Rieti, and olive trees and green bushes grow in the Red Sea.

But the nature of a great many springs is of remarkably high temperature, and this is found even on the ridges of the Alps, and actually in the sea, for instance in the Gulf of Baiae between Italy and the Island of Ischia, and in the river Garigliano and many others. In fact fresh water may be drawn from the sea in a great many places, as at the Swallow Islands and at Aradus and in the Gulf of Cadiz. Green grass grows in the hot springs of Padua, frogs in those of Pisa, fishes at Vetulonia in Tuscany near the sea. A river in the district of Casino called the Bubbling Water is cold, and is fuller in summer; water voles are born in it, as they are in the Stymphalis of Arcadia. The Fountain of Jupiter at Dodona, though it is cold and puts out torches dipped in it, sets them alight if they are brought near to it when they are out. The same spring always stops flowing at noon, on account of which it is called the Wait-a-bit; later it rises again and towards midnight flows abundantly, thereafter gradually ceasing again. A cold spring in Illyria sets fire to clothes spread out above it. The swamp of Jupiter Ammon is cold by day and hot at night. A spring in the Cave-dwellers' territory called the Fountain of the Sun is sweet and very cold at midday, but then gradually warming, towards the middle of the night it becomes spoilt owing to its heat and bitter taste. The source of the Po always dries up at midday in summer as if taking a siesta. A spring on the island of Tenedos after midsummer always overflows from 9 to 12 p.m.; and the spring Inopus on the island of Delos sinks or rises in the same way as the Nile and at the same times. On a small island in the sea at the mouth of the river Timavus there are hot springs that grow larger and smaller with the rise and fall of the tide. In the Pitino district across the Apennines the river Novanus is always hot at midsummer and dried up at midwinter. In the district of Falerii all the water makes oxen that drink it white. The Blackwater in Boeotia makes sheep black, the Cephisus flowing from the same lake makes them white, the Peneus again makes them black, and the river Xanthus at Ilium red, which gives the river its name. Mares pastured on the plains watered by the river Astaces on the Black Sea suckle their foals with black milk. The spring called Neminie in the district of Reate rises now in one place and now in another. indicating a change in the price of corn. A spring in the harbour at Brindisi always supplies pure water for mariners. The slightly acid spring called Lyncestis makes men tipsy, like wine; the same occurs in Paplilagonia and in the territory of Cales.

It is accredited by the Mucianus who was three times consul that the water flowing from a spring in the temple of Father Liber on the island of Andros always has the flavour of wine on January 5th: the day is called God's Gift Day. To drink of the Styx near Nonacris in Arcady causes death on the spot, although the river is not peculiar in smell or colour; similarly three springs on Mount Liberosus in Taurica irremediably but painlessly cause death. In the territory of Carrina in Spain there are two adjacent springs of which one rejects all objects and the other sucks them down; another in the same nation makes all the fish in it look of a golden colour, although except when in that water there is nothing peculiar about them. In the district by the Lake of Como a copious spring always swells up and sinks back again every hour. A hot spring on the island of Cydonea off Lesbos flows only in the springtime. Lake Sannaus in Asia is dved by the wormwood springing up round it. In the cave of Apollo of Claros at Colophon there is a pool a draught from which causes marvellous oracular utterances to be produced, though the life of the drinkers is shortened. Even our generation has seen rivers flow backward at Nero's last moments, as we have recorded in our history of that Emperor.

Again everybody is aware that all springs are colder in summer than in winter, as well as of the following miracles of nature that bronze and lead sink when in mass form, but float when flattened out into sheets; that among objects of the same weight some float, and others sink; that heavy bodies are more easily moved in water: that stone from Scyros in however large a mass floats, and the same stone broken into small pieces sinks; that bodies recently dead sink to the bottom but rise when they begin to swell; that empty vessels cannot be drawn out of the water more easily than full ones; that rain water is more useful than other water for salt-works, and that fresh water has to be mixed with sea water for the salt to he deposited: that sea water freezes more slowly and boils more quickly; that the sea is warmer in winter and salted in autumn; that all sea water is made smooth by oil, and so divers sprinkle oil from their mouth because it calms the rough element and carries light down with them; that on the high sea no snow falls; that though all water travels downward, springs leap upwards, and springs rise even at the roots of Etna, which is so hot that it belches out sands in a ball of flame over a space of 50 to 100 miles at a time.

107. (For we must also report some marvels connected with fire, the fourth element of nature, but first those arising from water.)

108. In Samosata the capital of Commagene there is a marsh that produces an inflammable mud called mineral pitch. When this touches anything solid it sticks to it; also when people touch it, it actually follows them as they try to get away from it. By these means they defended the city walls when attacked by Lucullus: the troops kept getting burnt by their own weapons. Water merely makes it burn more fiercely; experiments have shown that it can only be put out by earth.

109. Naphtha is of a similar naturethis is the name of a substance that flows out like liquid bitumen in the neighbourhood of Babylon and the parts of Parthia near Astacus. Naphtha has a close affinity with fire, which leaps to it at once when it sees it in any direction. This is how Medea in the legend burnt her rival, whose wreath caught fire after she had gone up to the altar to offer sacrifice.

110. But among mountain marvelsEtna always glows at night, and supplies its fires with fuel sufficient for a vast period, though in winter cloaked with snow and covering its output of ashes with hoar frost. Nor does nature's wrath employ Mount Etna only to threaten the lands with conflagration. Mount Chimaera in the country of Phaselis is on fire, and indeed burns with a flame that does not die by day or night; Ctesias of Cnidos states that water increases its fire but earth or dung puts it out. Also the Mountains of Hephaestus in Lycia flare up when touched with a flaming torch, and so violently that even the stones of the rivers and the sands actually under water glow; and rain only serves to feed this fire. They say that if somebody lights a stick at it and draws a furrow with the stick, streams of fire follow it. At Cophantium in Bactria a coil of flame blazes in the night, and the same in Media and in Sittacene the frontier of Persia: indeed at the White Tower at Susa it does so from fifteen smoke-holes, from the largest in the daytime also. The Babylonian Plain sends a blaze out of a sort of fishpool an acre in extent; also near Monnt Hesperius in Ethiopia the plains shine at night hke stars. Likewise in the territory of Megalopolis: for if that agreeable Bowl of Nymphaeus, which does not scorch the foliage of the thick wood above it and though near a cold stream is always glowing hot, ceases to flow, it portends horrors to its neighbours in the town of Apollonia, as Theopompus has recorded. It is augmented by rain, and sends forth asphalt to mingle with that unappetizing stream, which even without this is more liquid than ordinary asphalt. But who would be surprised by these things? During the Allies' War Holy Island and Lipari among the Aeolian Islands near Italy burnt in mid sea for several days, as did the sea itself, till a deputation from the senate performed a propitiatory ceremony. Nevertheless the largest volcanic blaze is that of the ridge in Ethiopia called the Gods' Carriage. which discharges flames that glow with truly solar heat.

In so many places and by so many fires does nature burn the countries of the earth.

111. Moreover, as this one element has a fertile principle that engenders itself and grows out of the smallest sparks, what must be expected to happen in future among all these funeral pyres of the earth? What is the natural principle that pastures a most voracious appetite on the whole world while itself unimpaired? Add thereto the innumerable stars and the mighty sun, add the fires of man's making and also those implanted in the nature of stone and of timber rubbing against itself, and again the fire of clouds, and the sources of thunderboltsand doubtless all marvels will be surpassed by the fact that there has ever been a single day on which there has not been a universal conflagration, when also hollow mirrors facing the sun's rays set things alight more easily than any other fire. What of the countless small but natural eruptions of fire? In the river Nymphaeus a flame comes out of a rock that is kindled by rain; also one comes out at the Scantian Springs, not a strong one, it is true, as it passes away, and not lasting long on any substance which it touches an ash tree shading this fiery spring is everlastingly green; one comes out in the district of Modena on the days appointed as sacred to Vulcan. It is found in the authorities that in the fields lying under Arezzo if charcoal is dropped on the ground, the earth is set on fire; that in the Sabine and Sidicine district a stone flames up when oiled that in the Sallentine town of Egnatia if wood is put on a certain sacred rock, a flame at once shoots up; that ashes on the altar of Juno at Lacinium, which stands in the open air, remains motionless when stormy winds sweep over it in every direction. Moreover, it is recorded that sudden fires arise both in pools of water and in bodies, even human bodies: Valerius Antias tells that the whole of Lake Trasimene once was on fire: that when Servius Tullius was a boy a flame flashed out from his head while he was asleep; and that a similar flame burnt on Lucius Marcius in Spain when he was making a speech after the death of the Scipios and exhorting the soldiers to revenge. Later we shall give more instances, and more in detail; for at the present we are displaying a sort of medley of marvels of all the elements. But leaving the interpretation of nature our mind hastens to lead the reader's attention by the hand on a tour of the whole world.

112. Our own portion of the earth, which is my subject, swims as it were in the ocean by which, as we have said, it is surrounded; its longest extent is from East to West, i.e. from India to the Pillars consecrated to Hercules at Cadiz, a distance of 8,568 miles according to Artemidorus, but 9,818 according to Isidore. Artemidorus adds in addition from Cadiz round Cape St. Vincent to Cape Finisterre the longest projection of the coast of Spain, 890 miles. The measurement runs by a double route; from the river Ganges and its mouth where it flows into the Eastern Ocean, through India and Parthyene to the Syrian city of Meriandrus situated on the Gulf of Scanderoon 5,215, from there by the shortest searoute to the Island of Cyprus, from Patara in Lycia to Rhodes, to the island of Astypalaea in the Carpathian Sea, to Taenarus in Laconia, Lilybaeum in Sicily, Caralis in Sardinia, 213, thence to Cadiz 1,250, the total distance from the Eastern Sea making 8,568. Another route, which is more certain, extends mainly overland from the Ganges to the river Euphrates 5,169, thence to Mazaca in Cappadocia 244, thence through Phrygin and Caria to Ephesus 499, from Ephesus across the Aegean Sea to Delos 200, to the Isthmus 202, thence by land and the Alcyonian Sea and the Gulf of Corinth to Patras in the Peloponnese 102, to Leucas 87, to Corfu ditto, to Acroceraunia 82, to Brindisi 87, to Rome 360, across the Alps to the village of Suze 518, through France to the Pyrenees at Granada 456, to the Ocean and the coast of Spain 832, across to Cadiz 7which figures by Artemidorus's calculation make 8,995 miles.

But the breadth of the earth from the south point to the north is calculated by Isidorus as less by about one half, 5,462

miles, showing how much the heat has abstracted on one side and the cold on the other. As a matter of fact I do not think that there is this reduction in the earth, or that it is not the shape of a globe, but that the uninhabitable parts on either side have not been explored. This measurement runs from the coast of the Ethiopic Ocean, where habitation just begins, to Meroe 705 miles, thence to Alexandria, 1,250, Rhodes 584, Cnidus 86, Cos 25, Samos 100, Chios 94. Mitvlene 65. Tenedos 49, Cape Sigeum 12, Bosphorus 312, Cape Carambis 350, mouth of Lake Maeotis 312, mouth of the Don 266,a route that by cutting down the crossings can be shortened From the mouth of the Don to the Canopic mouth of the Nile the most careful authorities have made the distance 2,110 miles. Artemidorus thought that the regions beyond had not been explored, though admitting that the tribes of the Sarmatae dwell round the Don to the northward. Isidorus added 1,250 miles right on to Thule, which is a purely conjectural estimate. I understand that the territory of the Sarmatae is known to an extent not less than the limit just stated. And from another aspect, how large is the space bound to be that is large enough to hold innumerable races that are continually migrating? This makes me think that there is an uninhabitable region beyond of much wider extent; for I am informed that beyond Germany also there are vast islands that were discovered not long ago.

These are the facts that I consider worth recording in regard to the earth's length and breadth. Its total circumference was given by Bratosthenes (an expert in every refinement of learning, but on this point assuredly an outstanding authorityl notice that he is universally accepted) as 252,000 stades, a measurement that by Roman reckoning makes 31,500 milesan audacious venture, but achieved by such subtle reasoning that one is ashamed to be sceptical. Hipparchus, who in his refutation of Eratosthenes and also in all the rest of his researches is remarkable, adds a little less than 26,000 stades.

Dionysodorus (for I will not withhold this outstanding instance of Greek folly) has a different creed. He belonged to Melos, and was a celebrated geometrician; his old age came to its term in his native place; his female relations who were his heirs escorted his obsequies. It is said that while these women on the following days were carrying out the due rites they found in the tomb a letter signed with his name and addressed to those on earth, which stated that he had passed from his tomb to the bottom of the earth and that it was a distance of 42,000 stades. Geometricians were forthcoming who construed this to mean that the letter had been sent from the centre of the earth's globe, which was the longest space downward from the surface and was also the centre of the sphere. From this the calculation followed that led them to pronounce the circumference of the globe to be 252,000 stades.

113. To this measurement the principle of uniformity, which leads to the conclusion that the nature of things is self-consistent, adds 12,000 stades, making the earth the 1/96th part of the whole world.

NATURAL HISTORY BOOK 3

1. So much as to the situation and the marvels of land and water and of the stars, and the plan and dimensions of the universe.

Now to describe its parts, although this also is considered an endless task, not lightly undertaken without some adverse criticism, though in no field does enquiry more fairly claim indulgence, only granting it to be by no means wonderful that one born a human being should not possess all human knowledge. For this reason I shall not follow any single authority, but such as I shall judge most reliable in their several departments, since I have found it a characteristic common to virtually all of them that each gave the most careful description of the particular region in which he personally was writing. Accordingly I shall neither blame nor criticise anyone. The bare names of places will be set down, and with the greatest brevity available, their celebrity and its reasons being deferred to their proper sections; for my topic now is the world as a whole. Therefore I should like it to be understood that I specify the bare names of the places without their record, as they were in the beginning before they had achieved any history, and that though their names are mentioned, it is only as forming a portion of the world and of the natural universe.

The whole circuit of the earth is divided into three parts, Europe, Asia and Africa. The starting point is in the west, at the Straits of Gibraltar, where the Atlantic Ocean bursts in and spreads out into the inland seas. On the right as you enter from the ocean is Africa and on the left Europe, with Asia between them; the boundaries are the river Don and the river Nile. The ocean straits mentioned are fifteen miles long and five miles broad, from the village of Mellaria in Spain to the White Cape in Africa, as given by Turranius Gracilis, a native of the neighbourhood while Livy and Cornelius Nepos state the breadth at the narrowest point as seven miles and at the widest as ten miles: so narrow is the mouth through which pours so boundless an expanse of water. Nor is it of any great depth, so as to lessen the marvel, for recurring streaks of whitening shoal-water terrify passing keels, and consequently many have called this place the threshold of the Mediterranean. At the narrowest part of the Straits stand mountains on either side, enclosing the channel, Ximiera in Africa and Gibraltar in Europe; these were the limits of the labours of Hercules, and consequently the inhabitants call them the Pillars of that deity, and believe that he cut the channel through them and thereby let in the sea which had hitherto been shut out, so altering the face of nature.

To begin then with Europe, nurse of the race that has conquered all the nations, and by far the loveliest portion of the earth, which most authorities, not without reason, have reckoned to be not a third part but a half of the world, dividing the whole circle into two portions by a line drawn from the river Don to the Straits of Gibraltar. The ocean, pouring the Atlantic sea through the passage I have described, and in its eager progress overwhelming all the lands that shrank in awe before its coming, washes also those that offer resistance with a winding and broken coastline: Europe especially it hollows out with a succession of bays, but into four chief gulfs, of which the first bends in a vast curve from the Rock of Gibraltar, which, as I have said, is the extremity of Spain, right to Locri on Cape Spartivento.

The first land situated on this gulf is called Further Spain or Baetica, and then, from the frontier at Mujacar, Hither Spain or the Department of Tarragon, extending to the chain of the Pyrenees. Further Spain is divided lengthwise into two provinces, Lusitania extending along the north side of Baetica and separated from it by the river Anas. This rises in Hither Spain, in the territory of Laminium and now spreading out into meres, now contracting into narrows, or burrowing entirely underground and gaily emerging again several times over, discharges itself into the Atlantic Ocean. The Department of Tarragon adjoin the Pyrenees, running down along the whole of one side of the chain and also extending across from the Iberian Sea to the Gallic Ocean, and is separated from Baetica and Lusitania by Mount Solorius and by the ranges of the Oretani and Carpentani and of the Astures.

Baetica, named after the river Baetis which divides it in two. stands first among the whole of the provinces in the richness of its cultivation and in a sort of peculiar fertility and brilliance of vegetation. It comprises four jurisdictions, those of Cadiz, Cordova, Ecija and Seville. Its towns number in all 175, of which 9 are colonies, 10 municipalities of Roman citizens, 27 towns granted early Latin rights, 6 free towns, 3 bound by treaty to Rome and 120 paying tribute. Worthy of mention in this district, or easily expressed in Latin, are: on the ocean coast beginning at the river Guadiana, the town Ossonoba, surnamed Aestuaria, at the confluence of the Luxia and the Urium; the Hareni Mountains; the river Guadalquivir; the winding bay of the Coast of Curum, opposite to which is Cadiz, to be described among the islands; the Promontory of Juno; Port Vaesippo; the town of Baelo; Mellaria, the strait entering from the Atlantic; Carteia, called by the Greeks Tartesos; Gibraltar. Next, on the coast inside the straits, are: the town of Barbesula with its river; ditto Salduba; the town of Suel; Malaga with its river, one of the treaty towns. Then comes Maenuba with its river; Firmum Julium sumamed Sexum; Sel; Abdara; Murgi, which is the boundary of Baetica. The whole of this coast was thought by Marcus Agrippa to be of Carthaginian origin; but beyond the Guadiana and facing the Atlantic Ocean is the territory of the Bastuli and Turduli. Marcus Varro records that the whole of Spain was penetrated by invasions of Hiberi, Persians, Phoenicians, Celts and Carthaginians: for he says that it was the sport (lusus) of Father Liber, or the frenzy ($\lambda \dot{\upsilon} \sigma \sigma \alpha)$ of those who revelled with him, that gave its name to Lusitania, and that Pan was the governor of the whole of it. The stories related of Hercules, Pyrene or Saturn I regard as absolutely mythical.

The Guadalquivir rises in the province of Tarragon, not at the town of Mentesa, as some authorities have said, but in the Tugiensian Forest bordered by the river Segura that waters the territory of Cartagena; at Lorea it avoids the Sepolero de Scipion and, turning westward, makes for the Atlantic Ocean, giving its name to the province; it is first of moderate size, but it receives many tributaries, from which it takes their glory as well as their waters. It first enters Baetica at Ossigetania, gliding gently in a picturesque channel past a series of towns situated on both its banks.

Between this river and the Ocean coast the most famous places inland are: Segida surnamed Augurina; Julia or Fidentia; Urgao or Alba; Ebura or Cerialis; lliberri or Libernii; llipula or Lans; Artigi or Julienses; Vesci or Faventia; Singili, Ategua, Arialdunum, Agla Minor, Baebro, Castra Vinaria, Cisimbrium, New Hippo, Illurco, Osea, Oscua, Sucaelo, Unditannm, Old Tucciall of which are places in that part of Bastetania which stretches towards the sea. In the jurisdiction of Cordova in the neighbourhood of the actual river are Ossigi surnamed Latonium, Iliturgi or Forum Julium, Ipra, Isturgi or Trintuphale, Sucia, and 17 miles inland Obulco or Pontificense, then Ripa, Epora (a treaty town), Sacili Martialium, Onuba, and on the right bank the

Copyright © 2018 by Lord Henfield, Guildford Scientific Press PAGE 3434 colony of Cordova surnamed Patricia. At this point the Guadalquivir first becomes navigable, and there are the towns of Carbula and Detunda, the river Xenil flowing into the Guadalquivir on the same side.

The towns of the jurisdiction of Hispalis are Celti, Axati, Arua, Canama, Evia, Ilipa surnamed Ilpa Italiea; on the left bank is the colony Ilispal surnamed Romulensis, while on the opposite side are the towns Osset surnamed Julia Constantia, Vergentum or Juli Genius, Orippo, Caura, Siarum, and the river Maenuba, a tributary of the Guadalquivir on its right. Between the estuaries of the Guadalquivir are the towns of Nabrissa, surnamed Veneria, and Colobana, with two colonies, Hasta, which is called Itegia, and inland Asido, which is called Caesarina.

The river Xenil, joining the Guadalquivir at the place in the list already mentioned, washes the colony of Astigi, surnamed Augusta Firma, from which point it becomes navigable. The other colonies in this jurisdiction exempt from tribute are Tucci, surnamed Augusta Gemella, lptuci or Virtus Julia, Ucubi or Claritas Julia, Urso or Genetiva Urbanorum; and among these once was Munda, which was taken with the younger Pompey. The free towns are Old Astigi and Ostippo, with the tributary towns of Callet, Callicula, Castra Gemina, Ilipula Minor, Marruca, Sacrana, Obulcula, Oningis, Sabora and Ventippo. At no great distance, on the Maenuba, another navigable river, are the settlements of Olontigi, Laelia and Lastigi.

The region stretching from the Guadalquivir to the river Guadiana beyond the places already mentioned is called Baeturia, and is divided into two parts and the same number of races, the Celtici bordering on Lusitania, of the jurisdiction of Seville, and the Turduli, who dwell on the borders of Lusitania and the Tarragon territory, but are in the jurisdiction of Cordova. That the Celtici came from the Celtiberi in Lusitania is proved by their religion, their language, and the names of their towns, which in Baetica are distinguished by surnames: Seria has the additional name of Fama Julia, Nertobriga that of Concordia Julia, Segida that of Restituta Julia, Ugultunia that of Contributa Julia (in which now is also included the town of Curiga), Lacimurga that of Constantia Julia, and Stereses the surname of Fortunales and Callenses that of Aeneanici. Besides these places there are in Celtica Acinipo, Arunda, Arunci, Turobriga, Lastigi, Salpesa, Saepone, Serippo. The other part of Baeturia, which we have said belongs to the Turduli and to the jurisdiction of Cordova, contains the not undistinguished towns of Arsa, Mellaria, Mirobriga Regina, Sosintigi and Sisapo. To the jurisdiction of Cadiz belong Regina, with Roman citizens, Laepia Regia with Latin citizens, Carisa surnamed Aurelia, Urgia surnamed Castrum Julium, and also Caesaris Salutariensis; the tributary towns of Besaro, Beippo, Barbesula, Blacippo, Baesippo, Callet, Cappacum, Oleastro, Iptuci, Ibrona, Lascuta, Saguntia, Saudo Usaeno

The total length of Baetica according to Marcus Agrippa is 475 miles, and its breadth 258 miles, but this was when its bounds extended as far as Cartagena: such extensions comparatively often give rise to great errors in the measurements of distances, as they sometimes cause alterations in the boundary of provinces and sometimes an increase or reduction of the mileage of roads. During so long a period of time the seas have been encroaching on the land or the shores have been moving forward, and rivers have formed curves or have straightened out their windings. Moreover different persons take different starting-points for their measurements and follow different lines; and the consequence is that no two authorities agree.

2. At present the length of Baetica from the frontier of the town of Cazlona to Cadiz is 250 miles, and from the sea-front of Murgi 25 miles more; its breadth from Carteia along the coast to the Guadiana is 234 miles. Agrippa was a very painstaking man, and also a very careful geographer; who therefore could believe that when intending to set before the eyes of Rome a survey of the world he made a mistake, and with him the late lamented Augustus? for it was Augustus who completed the portico containing a plan of the world that had been begun by his sister in accordance with the design and memoranda of Marcus Agrippa.

3. The old shape of Hither Spain has been considerably altered, as has been that of several provinces, in as much as Pompey the Great on his trophies which he set up in the Pyrenees testified that he had brought into subjection 876 towns between the Alps and the borders of Further Spain. Today the whole province is divided into seven jurisdictions, namely those of Cartagena, Tarragon, Saragossa, Clunia, Astorga, Lugo, Braga. In addition there are the islands which will be mentioned separately, but the province itself contains, besides 293 states dependent on others, 189 towns, of which 12 are colonies, 13 are towns of Roman citizens, 18 have the old Latin rights, one is a treaty town and 135 are tributary.

The first people, on the coast, are the Bastuli, and after them in the following order proceeding inland come the Mentesani, the Bretani, the Carpetani on the Tagus, and next to them the Vaccaei, the Vettones and the Celtiberian Arevaci. The towns nearest the coast are Urci and Barea that belongs to Baetica, then the district of Bastitania, next after which comes Contestania and the colony of New Carthage, from the promontory of which, called the Cape of Saturn, the crossing to Caesarea, a city of Mauretania, is 197 miles. There remain to be mentioned on the coast the river Tader and the tax-free colony of Ilici, from which the Ilicitan Gulf takes its name: to this colony the Icositani are subordinate. Next come Lucentum, with Latin rights, Dianium, a tributary town, the river Sucro and in former days a town of the same name, forming the boundary of Contestania. The district of Metania comes next, with a lovely expanse of lake in front of it, and reaching back to Celtiberia. The colony of Valencia three miles from the sea, the river Turium, Saguntum, also three miles from the sea, a town with Roman citizenship, famous for its loyalty, and the river Udiva. The district of the Ilergaones, the river Ebro, rich in ship-borne trade, rising in the district of the Cantabri not far from the town of Juliobrica, with a course of 450 miles, for 260 of which from the town of Vareia it is navigable for ships, and because of it the Greeks have called the whole of Spain by the name of Iberia. Next the district of Cessetania, the river Subi, the colony Tarragon, which was founded by the Scipios, as Cartagena was by the Carthaginians. The district of the Ilergetes comes next, the town of Subur and the river Rubricatum, after which begin the Lacetani and the Indigetes. After them in the following order proceeding inland from the foot of the Pyrenees are the Ausetani, the Jacetani, the Cerretani along the Pyrenees, and then the Vaseones. On the coast is the colony of Lareclonia, surnamed Faventia, the Roman towns of Badalona and Iluro, the River Arnuni, Blandae, the river Alba, Amporias, one part of which is inhabited by the original natives and the other by Greeks descended from the Phocaeans, and the river Ticer. From it Cabo de Cruz on the other side of the promontory is 40 miles distant.

We will now take the jurisdictions in order and give noteworthy facts about them in addition to those mentioned above. Forty-two peoples are subject to the jurisdiction of the courts of Tarragona; of them the best known arewith the rights of Roman citizens, the people of Tortosa and the Bisgargitani; with Latin rights, the Ausetani, the Cerretani surnamed Juliani, and those surnamed Augustani, the Edetani, Gerundenses, Gessorienses, and Teari or Julienses; tributaries, the Aquicaldenses, Aesonenses and Baeculonenses.

Caesaraugusta, a colony that pays no taxes, is washed by the river Ebro; its site was once occupied by a town called Salduba, belonging to the district of Edetania. It is the centre for 55 peoples; of these with the rights of Roman citizens are the Bilbilitani, the Celsenses (once a colony), the Calagurritani (surnamed Nasici), the Ilerdenses belonging to the race of the Surdaones next to the river Sicoris, the Oscenses of the district of Suessetania, and the Turiassonenses; with the old Latin rights are the Cascantenses, Ergavicenses, Graceurritani, Leonicenses and Osieerdenses; bound by treaty are the Tarracenses; tributary are the Arcobrigenses, Andelonenses, Aracelitani, Bursaonenses, Calagurritani surnamed Fibularenses, Complutenses, Carenses, Iluberitani, Jacetani, Libienses, Pompelonenses and Segienses.

At Cartagena assemble sixty-five peoples, not including inhabitants of islands: from the colony of Accitana Gemellensis and from Libisosana named Foroaugustana, to both of which Italic rights have been given, from the colony of Salaria; townsmen with the rights of old Latium, the Castulonenses, also called Caesarii Iuvenales, the Saetabitani or Augustani, and the Valerienses. Of the tributary peoples the best known are the Alabanenses, Bastitani, Consaburrenses, Dianenses, Egelestani, Iloreitani, Laminitani, Mentesani or Oretani, Mentesani or Bastuli, the Oretani surnamed Germani, and the people of Segobriga, capital of Celtiberia, the people of Toletum on the Tagus, the capital of Carpetania, and then the Viatienses and the Virgilienses.

To the jurisdiction of Corunna the Varduli bring fourteen peoples, of whom we would mention only the Alabanenses, and the Turmogidi bring four, including the Segisamonenses and the Segisamaiulieuses. To the same jurisdiction go the Carietes and the Vennenses with five states, of whom the Velienses form one. Thither too go the Pelendones of the Celtiberians with four peoples, of whom the Numantines were once famous, as among the seventeen states of the Vaccaei were the Intercatienses, Palantini, Lacobrigenses and Caucenses. Then among the Cantabriei, seven peoples, one state only, Juliobriga, need be mentioned, and Tritimn and Virovesea among the ten states of the Autrigones. The Arevaei got their name from the river Areva: to them belong six towns. Secontia and Uxama, common names in other regions, also Segovia and Nova Augusta, with Hermes and Corunna itself, the end of Celtiberia. The rest of the country stretches towards the ocean and here are the Varduli of those already mentioned and the Cantabri.

Adjoining these are twenty-two peoples of the Astures, divided into the Augustani and the Trammontani, with the splendid city of Asturiea; these include the Gigurri, Peseii, Lancienses and Zoelae. The total number of the population amounts to 240,000 free persons.

The jurisdiction of Lucus contains 15 peoples, unimportant and bearing outlandish names, excepting the Celtici and Lemavi, but with a free population amounting to about 166,000.

In a similar way the twenty-four states of Braga contain 286,000 persons, of whom besides the Bracari themselves may be mentioned, without wearying the reader, the Biballi, Coelerni, Callaeci, Equaesi, Limici and Querquerni.

The length of Hither Spain from the Pyrenees to the frontier of Cazlona is 607 miles, and a little more along the coast; its breadth from Tarragon to the shore of Olarson is 307 miles, starting from the foot of the Pyrenees, where the country forms the shape of a wedge between the two seas; then gradually it widens out, and where it touches Further Spain it adds more than as much again to its breadth.

Nearly the whole of Spain is covered with mines of lead, iron, copper, silver and gold, Hither Spain with muscovite mines also; Baetica abounds in cinnabar as well. There are besides quarries of marble. His Majesty the Emperor Vespasian bestowed the rights of Latium on the whole of Spain when it had been storm-tossed by civil disorders. The frontier between the Spanish and the Gallic provinces is formed by the mountains of the Pyrenees, with headlands projecting into the two seas on either side.

4. The part of the Gauls washed by the Mediterranean is entitled the province of Narbonne, having previously had the name of Bracata. It is divided from Italy by the river Var. and by the ranges of the Alps, a very secure protection for the Roman Empire, and from the rest of Gaul on the north by the Cevennes and Jura mountains. Its agriculture, the high repute of its men and manners and the vastness of its wealth make it the equal of any other province: it is, in a word, not so much a province as a part of Italy. On the coast there is the district of the Sordones, and more inland that of the Consuarani; the rivers are the Tech and the Verdouble, and the towns Elne, the mere shadow of what was once a mighty city, and Castel Roussillon, which has Latin rights. Then come the river Aude, which flows from the Pyrenees through the lake Rubrensis. Narbonne, a colony of the tenth legion twelve miles from the sea, and the rivers Ildrault and Lea. Apart from those mentioned there are but few towns, owing to the marshes that fringe the coast. There is Agde, formerly belonging to Marseilles, the district of the Volcae Tectosages, and the former site of Rhoda, a colony of Rhodes, that has given its name to the Rhone, the most fertile river of the two Gauls, which rushes from the Alps though the Lake of Geneva. bringing along the sluggish Sane and the Isre and Durance which are as rapid as itself. Of its mouths the two smaller are called Libica, one the Spanish, the other the Metapinian; the third and largest is the Massaliotic. Some authorities state that at the mouth of the Rhone there was once a town called Heraclea. Beyond are the canals leading out of the Rhone, famous as the work of Gaius Marius whose distinguished name they bear, Lake Mastromela and the town of Maritima of the Avatici, and above are the Stony Plains, where tradition says that Hercules fought battles, the district of the Anatilii, and inland those of the Dexivates and Cavares. Returning to the sea we have the districts of the Tricores and inland those of the Tritolli, Vocontii and Segovellauni, and after them the Allobroges. On the coast is Marseilles, founded by the Greeks of Phocaea and now a confederate city, then the promontory of Zao, the harbour of Citharista, the district of the Camactulici, then the Suelteri and above them the Verucini. On the coast too are Athenopolis of the Massilians, Frjus, a colony of the eighth legion, called Pacensis and Classica, a river named Argenteus, the district of the Oxubii and Ligauni, beyond whom come the Suebri. Ouariates and Adunicates. On the coast is the town of Antibes with Latin rights, the district of the Deciates and the river Var, which rises in Mont Genis in the Alps.

The colonies in the interior are: Aries, the station of the sixth legion, Bziers of the seventh, Orange of the second, Valence in the territory of the Cavares, and Vienne in that of the Allobroges. The towns with Latin rights are Aix in the territory of the Salluvii, Mignon of the Cavares, Apt of the Vulgientes, Pies of the Reii Apollinares, Alba of the Helvi, Augusta of the Tricastinf, Anatilia, Aetea, the Bormani, the Comani, Cavaillon, Carcassonne of the Volcae Tectosages, Cessero, Carpentras of the Memini, the Caenicenses, the Camboleetri surnamed Atlantici, Forum Voconi, Glanum Libii, the Lutevani also called Foroneronienses, Nimes of the Arecomici, Pzenas, the Ruteni, the Samnagenses, the Tolosani of the Tectosages on the border of Aquitania, the Tasgoduni, the Tarusconienses, the Umbranici, the two capitals of the confederate state of the Vocontii, Vasio and Lucus Augusti; and also unimportant towns to the number of 19, as well as 24 assigned to the people of Nimes. The Emperor Galba added to the list two peoples dwelling in the Alps, the people of Avanon and the Bodiontici, whose town is Digne. According to Agrippa the length of the province of Narbonne is 370 miles and the breadth 248.

5. After this comes Italy, the first people of it being the Ligurians, after whom come Etruria, Umbria and Latium, where are the mouths of the Tiber and Rome, the capital of the world, sixteen miles from the sea. Afterwards come the coast of the Volsci and of Campania, then of Picenum and Lucania and the Bruttii, the southernmost point to which Italy juts out into the sea from the almost crescent-shaped chain of the Alps. After the Bruttii comes the coast of Magna Graecia, followed by the Sallentini, Paediculi, Apuli, Paeligni, Frentani, Marrueini, Vestini, Sabini, Picentes, Gauls, Umbrians, Tuscans, Venetians, Carni, Iapudes, Histri and Liburni. I am well aware that I may with justice be considered ungrateful and lazy if I describe in this casual and cursory manner a land which is at once the nursling and the mother of all other lands, chosen by the providence of the gods to make heaven itself wore glorious, to unite scattered empires, to make manners gentle, to draw together in converse by community of language the jarring and uncouth tongues of so many nations, to give mankind civilisation, and in a word to become throughout the world the single fatherland of all the races. But what am I to do? The great fame of all its places who could touch upon them alland the great renown of the various things and peoples in it give me pause. In that list even the city of Rome alone, a countenance and one worthy of so glorious a neck, what elaborate description it merits! In what terms to describe the coast of Campania taken by itself, with its blissful and heavenly loveliness, so as to manifest of that there is one region where nature has been at work in her joyous mood! And then again all that invigorating healthfulness all the year round, the climate so temperate, the plains so fertile, the hills so sunny, the glades so secure, the groves so shady! Such wealth of various forests, the breezes from so many mountains, the great fertility of its corn and vines and olives, the glorious fleeces of its sheep, the sturdy necks of its bulls, the many lakes. the rich supply of rivers and springs flowing over all its surface, its many seas and harbours and the bosom of its lands offering on all sides a welcome to commerce, the country itself eagerly running out into the seas as it were to aid mankind. I do not speak of the character and customs of its people, its men, the nations that its language and its might have conquered. The Greeks themselves, a people most prone to gushing self-praise, have pronounced sentence on the land by conferring on but a very small part of it the name of Great Greece! The truth is that in this part of my the heavenstouch upon particular points and only a few of the stars. I merely ask my readers to remember that I am hastening on for the purpose of setting forth in detail all the contents of the entire world

In shape, then, Italy much resembles an oak leaf, being far longer than it is broad, bending towards the left at its top and ending in the shape of an Amazon's the projection in the centre being called Cocynthos, while it sends out two horns along bays of crescent shape, Leucopetra on the right and Lacinium on the left. Its length extends for 1020 miles, beginning from Aosta at the foot of the Alps and passing through Rome and Capua in a winding course to the town of Reggio situated on its shoulder, where begins the curve, as it were, of the neck. The measure would be much greater if the line were carried on to Lacinium, but with that bend the line would seem to diverge to one side. The breadth varies, being four hundred and ten miles between the rivers Var and Arsa where they flow into the Mediterranean and the Adriatic, but about at the middle, in the neighbourhood of the city of Rome, from the mouth of the river Pescara, which flows into the Adriatic Sea, to the mouths of the Tiber, its breadth is 136 miles, and a little less from Castrum Novum on the Adriatic Sea to Palo on the Tuscan Sea, in no place exceeding a width of 200 miles. The circuit of the entire coast from the Var round to the Ama is 2049 miles. Its distances from the countries that surround it are as follows: from Istria and Liburnia in certain places 100 miles, from Epirus and Illyricum, 50 miles, from Africa, according to Marcus Varro, less than 200, from Sardinia 120, from Sicily 1, from Corcyra less t.han 80, from Issa 50. It stretches through the seas in a southerly direction, but a more careful and accurate calculation would place it between due south and sunrise at midwinter. We will now give an account of a circuit of Italy, and of its cities. Herein it is necessary to premise that we intend to follow the authority of his late Majesty Augustus, and to adopt the division that he made of the whole of Italy into eleven regions, but to take them in the order that will be suggested by the coast-line, it being indeed impossible, at all events in a very cursory account, to keep the neighbouring cities together; and so in going on to deal with the inland districts we shall follow the Emperor's alphabetical arrangement, adopting the enumeration of the colonies that he set out in that list. Nor is it easy to trace their sites and origins, the Ligurian Ingauni, for examplenot to mention the other peopleshaving received grants of land on thirty occasions.

Therefore starting from the river Var we have Nice, founded by the people of Marseilles, the river Paghone, the Alps and the Alpine tribes with many names, of which the chief is the Long-haired; Cimiez, the town of the state of the

Vediantii, the port of Hercules of Monaco, and the Ligurian coast. Of the Ligurians beyond the Alps the most famous are the Sallui, Deciates and Oxubi; on this side, the Veneni, Turn, Soti, Vagienni, Statielli, Binbelli, Maielli, Cuburniates, Casmonates, Velleiates, and the tribes whose towns on the coast we shall mention next. The river Royas, the town of Ventimiglia, the river Merula, the town of Alhenga, the port of Vai or Savona, the river Bisagna, the town of Genoa, the river Fertor, Porto Fino, Tigulia inland, Sestri di Levante, and the river Magra, which is the boundary of Liguria. Behind all the above-mentioned lie the Apennines, the largest range of mountains in Italy, extending in an unbroken chain from the Alps to the Straits of Messina. On one side of the range, along the Po, the richest river of Italy, the whole country is studded with famous and flourishing towns: Libama, the colony of Dertona, Iria, Vardacas, Industria, Pollenza, Correa snrnamed Potentia, Forum Fulvi or Valenza, Augusta of the Bagienni, Mba Pompcia, Aste, Acqui. Under the partition of Augustus this is the ninth region. The coast of Liguria extends 211 miles between the rivers Var and Magra.

The adjoining region is the seventh, in which is Etruria, beginning at the river Magra, a district that has often changed its name. From it in ancient times the Umbri were driven out by the Pelasgi, and these by the Lydians, who after a king of theirs were styled Tyrrheni, but later in the Greek language Tusci, from their ritual of offering sacrifice. The first town in Etruria is Luni, famous for its harbour: then the colony of Lucca, some way from the sea and nearer to Pisa, between the rivers Auser and Arno, which owes its origin to the Pelopidae or to the Greek tribe of the Teutani; then come the Marshes of Volterra the river Cecina and Piombino, once the only Etruscan town on the coast. After these is the river Prile, and then the navigable river Ombrone, at which begins the district of Umbria, the port of Telamone, Cosa of the Volcientes, founded by the Roman people, Graviscae, Castrum Novum, Pyrgi, the river and the town of Caere, seven miles inland, called Agylla by the Pelasgians who founded it, Alsium, Fregenae, and the river Tiber, 284 miles from the Magra. Inland are the colonies of Falisca, founded according to Cato by the Argives and surnamed Falisca of the Etruscans, Lucus Feroniae, Rusellana, Siena and Sutria. The remaining people are the Arretini Veteres, Arretini Fidentiores, Arretini Julienses, Amitinenses, Aquenses surnamed Taurini, Blerani, Cortonenses, Capenates, Clusini Novi, Chisini Veteres, the Florentini on the bank of the Arno that flows by, Faesulae, Ferentinum, Fescennia, Hortanurn, Herbanum, Nepi, Nine Villages, the Claudian Prefecture of Foroclodiurn, Pistoriuni, Perugia, the Suanenses, the Saturnini formerly called the Aurini, the Subertani, Statonenses, Tarquinienses, Tuscanienses, Vetulonienses, Veientani, Vesentini, Volaterrani, the Volcentani surnamed Etrusci, and Volsinienses. In the same district the territories of Crustumium and Caletra still keep the names of the ancient towns

The Tiber the former name of which was Thybris and before that Albula, rises in about the middle of the Apennine chain in the territory of Arezzo. At first it is a narrow stream, only navigable when its water is dammed by sluices and then discharged, in the same way as its tributaries, the Tinia and the Chiana, the waters of which must be so collected for nine days, unless augmented by showers of rain. But the Tiber, owing to its rugged and uneven channel, is even so not navigable for a long distance, except for rafts, or rather logs of wood; in a course of 150 miles it divides Etruria from the Linibrians and Sabines, passing not far from Tifernum, Perugia and Ocriculum, and then, less than 16 miles from Rome, separates the territory of Veii from that of Crustumium, and afterwards that of Fidenae and Latium from Vaticanurn. But below the confluence of the Chiana from Arezzo it is augmented by forty-two tributaries, the chief being the Nera and the Severone (which latter is itself navigable, and encloses Latiurn in the rear), while it is equally increased by the aqueducts and the numerous springs carried through to the city; and consequently it is navigable for vessels of whatever size from the Mediterranean, and is a most tranguil trafficker in the produce of all the earth, with perhaps more villas on its banks and overlooking it than all the other rivers in the whole world. And no river is more circumscribed and shut in on either side; yet of itself it offers no resistance, though it is subject to frequent sudden floods, the inundations being nowhere greater than in the city itself. But in truth it is looked upon rather as a prophet of warning. its rise being always construed rather as a call to religion than as a threat of disaster.

Old Latium has preserved the original limits, extending from the Tiber to Cerceii, a distance of 50 miles; so exiguous at the beginning were the roots of the Empire. Its inhabitants have often changed: at various times it has been occupied by various peoplesthe Aborigines, the Pelasgi, the Arcades, the Siculi, the Aurunci, the Rutuli, and beyond Circello the Volsci, Osci and Ausones, owing to which the name of Latium came to be extended as far as the river Garigliano. To begin with there is Ostia, a colony founded by a Roman king, the town of Laurentum, the grove of Jupiter Indiges, the river Numicius, and Ardea, founded by Dana the mother of Perseus. Then comes the site of what was once Aphrodisium, the colony of Antium, the river and island called Astura, the river Ninfa, the Roman Bulwarks, Circello, once an island surrounded by a boundless sea, if we are to believe Homer, but now surrounded by a plain. The facts that we are able to publish for the information of the world on this matter are remarkable. Theophrastus, the first foreigner to write with special care about the Romansfor Theopompus, before whom nobody mentioned them, merely states that Rome was taken by the Gauls, and Clitarchus, the next after him, only that an embassy was sent to AlexanderTheophrastus, I say, relying on more than rumour, has actually given the measurement of the island of Circello as 80 furlongs in the volume that he wrote in the archonship of Nicodorus at Athens, which was the 440th year [314 BC] of our city. Whatever land therefore has been joined to the island beyond the circumference of 10 miles was added to Italy after that year. Another marvel not far from Circello is the Pomptine Marsh, a place which Mucianus, who was three times consul, has reported to be the site of 24 cities. Then comes the river Aufentum, above which is the town of Tarraeina, called Anxur in the dialect of the Volsci, and the site of Amyclae, or Amynclae, the town destroyed by serpents, then the place called the Grottoes, Lake Fundanus, the port of Gaeta, the town of Formiae, called also Hormiae, the ancient abode, it has been thought, of the Laestrygones. Beyond this formerly stood the town of Pirae, and still exists the colony of Minturnae, through which runs the river Liris. once called Clanis; and Sinuessa, the last town in the Extension of Latium, and stated by some authorities to have been once styled Sinope.

Then comes the favoured country of Campania; in this valley begin those vine-clad hills with their glorious wine and wassail, famous all the world over, and (as old writers have said) the scene of the severest competition between Father Liber and Ceres. From this point stretch the territories of Sezza and Caecubum, with which march the Falernian and those of Calvi. Then rise up Monte Massico, Monte Barbaro and the hills of Sorrento. Here spread the plains of Leborium, where the spelt crop is sedulously tended to produce delicious frumity. These shores are watered by hot springs, and are noted beyond all others throughout the whole of the sea for their famous shell and other fish. Nowhere is there nobler olive oilanother competition to gratify man a pleasure. Its occupants have been Oscans, Greeks, Umbrians, Tuscans and Campanians. On the coast are the river Saove, the town of Volturno with the river of the same name, Liternum, the Chalcidian colony of Cumae. Miseno, the port of Baiae, Bacolo, the Lucrine lake, Lake Averno near which formerly stood the town of Cimmerium, then Pozzuoli, formerly called the Colony of Dicaearchus; after which come the plaim of Salpatara and the Lago di Fusaro near Comae. On the coast stands Naples, itself also a colony of the Chalcidians, named Parthenope from the tomb of one of the Sirens, Herculaneum, Pompei with Mount Vesuvius in view not far off and watered by the river Sarno, the Nucerian territory and nine miles from the sea Nocera itself, and Sorrento with the promontory of Minerva that once was the abode of the Sirens. From this place the distance by sea from Cerceii is 78 miles. This region, beginning from the Tiber, under the partition made by Augustus is regarded as the first region of Italy.

Inland are the following colonies: Capua, so named from its forty miles of plain (campus), Aquino, Suessa, Venafro, Sora, Teano surnamed Sidicinum, and Nola; and the towns of Abellinum, Aricia, Alba Longa, the Acerrani, the Allifani, the Atinates, the Aletrinates, the Anagnini, the Atellani, the Aefulani, the Arpinates, the Auximates, the Abellani, the Alfaterni (both those that take their surname from the Latin territory, and from the Hernican, and from the Labican), Bovillae, Caiatiae, Casinum, Calenum, Capitulum of the Hernici, the Cereatini who have the surname of Mariani, the Corani descended from the Trojan Dardanus, the Cubulterini, the Castrimoenienses, the Cingulani, the Fabienses on Mount Albanus, the Foropopulienses from the Falernian district, the Frusinates, the Ferentinates, the Freginates, the Old Fabraterni, the New Fubraterni, the Ficolenses, the Fregellani, Forum Appi, the Forentani, the Gabini, the Interamnates Sucasini, also called the Lirenates, the Ilionenses, the Lanivini, the Norbani, the Nomentani, the Praenestini with their city once called Stephane, the Privernates, the Setini, the Signini, the Suessulani, the Telesini, the Trebulani surnamed Ballienses, the Trebani, the Tusculani, the Verulani, the Veliterni, the Ulubrenses, the Urbanates; and besides all these Rome itself, whose other name it is held to be a sin to utter except at the ceremonies of the mysteries, and when Valerius Soranus divulged the secret religiously kept for the weal of the state, he soon paid the penalty. It seems pertinent to add at this point an instance of old religion established especially to inculcate this silence: the goddess Angerona, to whom sacrifice is offered on December 21, is represented in her statue with a sealed bandage over her mouth.

Romulus left Rome possessing three or, to accept the statement of the authorities putting the number highest, four gates. The area surrounded by its walls at the time of the

principate and censorship of the Vespasians, in the 826th [73 ADI of its foundation, measured 13 miles and 200 vards in circumference, embracing seven hills. It is itself divided into fourteen regions, with 265 crossways with their guardian Lares. If a straight line is drawn from the milestone standing at the head of the Roman Forum to each of the gates, which today number thirty-seven (provided that the Twelve Gates be counted only as one each and the seven of the old gates that exist no longer be omitted), the result is a total of 20 miles 765 yards in a straight line. But the total length of all the ways through the districts from the same milestone to the extreme edge of the buildings, taking in the Praetorians' Camp, amounts to a little more than 60 miles. If one were further to take into account the height of the buildings, a very fair estimate would be formed, that would bring us to admit that there has been no city in the whole world that could be compared to Rome in magnitude. On the east it is bounded by the Dyke of Tarquinius Superbus, a work among the leading wonders of the world, for he made it as high as the walls where the approach was flat and the city lay most open to attack. In other directions it had the protection of lofty walls or else of precipitous hills, except for the fact that the increasing spread of buildings has added a number of cities to it.

The first region formerly included the following celebrated towns of Latium besides those mentioned: Satricum, Pometia, Scaptia, Politorium, Tellena, Tifata, Caenina, Ficana, Crustumerium, Ameriola, Medullum, Corniculum, Satuxnia on the site of the present Rome, Antipolis, which today is Janiculum and a part of Rome, Antemnae, Camerium, Collatia, Amitinum, Norbe, Sulmo; and together with these the Alban peoples who were accustomed to receive flesh on the Alban Hill, namely the Albani, Aesolani, Accienses, Abolani, Bubetani, Bolani, Cusuetani, Coriolani, Fidenates, Foreti, Hortenses, Latinienses, Longulani, Manates, Macrales, Numinienses, Olliculani, Octulani, Pedani, Munienses. Polluscini, Querquetulani, Sicani, Sisolemes, Tolerienses, Vimitellari, Velienses, Venetulani, Vitellenses. Tutienses, Thus 53 peoples of Old Latium have perished without leaving a trace

In the Campanian territory the town of Stabiae existed right down to April 29 in the consulship of Gnaeus Pompeius and Lucius Cato, when Lieutenant-General Lucius Sulla in the Allies' War destroyed the place that has now been reduced to a farmhouse. Here also was Taurania, which has now perished; and the remains of Casilinum are in process of disappearance. Furthermore, Antias records that the Latin town of Apiolae was captured by King Lucius Tarquinius, who used the spoils of it to begin building the Capitol. The 30 miles of Picentine territory between the district of Sorrento and the river Silaro belonged to the Etruscans; it sins famous for the temple of Argive Juno founded by Jason. Further inland was Picentia, a town of Salerno.

At the Silaro begins the third region, the Lucanian and Bruttian territory: in this too there have been frequent changes of population. It has been occupied by Pelasgi, Oenotri, Itali, Morgetes, Siculi, and mostly by peoples of Greece, and most recently by the Lucani, Samnite in origin, whose leader was Lucius. The town of Paestum (called Posidonia by the Greeks), the bay of Paestum, the town of Thea, now Velia, Cape Palinuro, from which across the bay that here stretches inland the distance to the Royal Pillara is 100 miles. Next is the river Melpes, the town of Buxentum (the Greek name of which is Pyxus) and the river Lausthere was once a town also of the same name. Here begins the coast of the Bruttii, with the town of Blanda, the river Baletum, the port of Parthenius, founded by the Phocians, the Bay of Vibo, the site of Clampetia, the town of Tempsa (the Greek name of which is Temese), and Terina, founded by the people of Croton, and the extensive Bay of Terina; and inland the town of Cosenza. On a peninsula is the river Acheron, which gives its name to the township of the Acherontians; Hippo, which we now call Vibo Valentia; the Port of Hercules, the river Metaurus, the town of Tauroentum, the Port of Orestes, and Medma; the town of Scyllaeum and the river Crataeis. known in legend as the Mother of Scylla: then the Royal Pillar, the Straits of Messina and the two opposing headlands, Caenus on the Italian and Pelorum on the Sicilian side, the distance between them being 1 miles; Reggio is 11 miles away. Next comes the Apennine forest of Sila, and the promontory of Leucopetra 15 miles from it, and Epizephyrian Locri (called after the promontory of Zephyrium) 51 miles: it is 303 miles from the river Silaro. And this rounds off the first gulf of Europe.

The names of the seas that it contains are as follows: that from which it makes its entrance is the Atlantic, or as others call it, the Great Sea; the strait by which it enters is called by the Greeks Porthmos and by us the Straits of Cadiz; after it has entered, as far as it washes the coast of the Spains it is called the Spanish Sea, or by others the Iberian or the Balearic Sea; then the Gallic Sea as far as the Province of Narbonne, and afterwards the Ligurian Sea; from that point to the Island of Sicily the Tuscan Sea, which some of the Greeks call the Southern Sea and others the Tyrrhenian, but most of our own people the Lower Sea. Beyond Sicily, as far as the southeastern point of Italy Polybius calls it the Ausonian Sea, but Eratosthenes calls all the part between the ocean inlet and Sardinia the Sardoan Sea, from Sardinia to Sicily the Tyrrheuian, from Sicily to Crete the Sicilian, and beyond Crete the Cretan.

The first of all the islands scattered over these seas are called with the Greeks the Pityussae, from the pine trees that grow on them: each of these islands is now named Ebusus and in treaty with Rome, the channel between them being narrow. Their area is 46 miles, and their distance from Denia 871 miles, which is the distance by land from Denia to New Carthage, while at the same distance from the Pityussac out to sea are the two Balearic islands, and opposite the River Xucar lies Colubraria. The Balearic islands, formidable in warfare with the sling have been designated by the Greeks the Gymnasiae. The larger island, Majorca, is 100 miles in length and 475 in circumference. It contains towns of Roman citizen colonists, Palma and Pollenza, towns with Latin rights, Sineu and Tucis; a treaty town of the Bocchi, no longer existing. The smaller island, Minorca, is 30 miles away from Majorca: its length is 40 miles and its circumference 150; it contains the states of Iamo, Sanisera and Port Mahon. Twelve miles out to sea from Majorca is Cabrera, treacherous for shipwrecks, and right off the city of Palma lie the Malgrates and Dragonera and the small island of El Torre.

The soil of Iviza drives away snakes, but that of Colubraria breeds snakes, and consequently that land is dangerous to all people except those who bring earth from Iviza; the Greeks called it Snake Island. Iviza does not breed rabbits either, which ravage the crops of the Balearics. The sea is full of shoals, and there are about twenty other small islands; off the coast of Gaul at the mouth of the Rhone is Metina, and then the island named Brescon, and the three which the neighbouring people of Marseilles call the Row of Islands because of their arrangement, their Greek names being First Island, Middle Island, also called Pomponiana, and the third Hypaea; next to these are Iturium, Phoenica, Lero, and opposite Antibes Lerina, on which according to local tradition there was once a town called Berconum.

VI. In the Ligurian Sea, but adjoining the Tuscan, is the island of Corsica, the Greek name of which is Cyrnos it lies in a line from north to south, and is 150 miles long and at most points 50 miles broad: its circumference measures 325 miles; it is 62 a miles from the Shallows of Volterra. It contains 32 states, and the colonies of Mariana founded by Gaius Marius and Aleria founded by Sulla when Dictator. Nearer the mainland is Oglasa, and inside that, and 60 miles from Corsica, Pianosa, so named from its appearance, as it is level with the sea and consequently treacherous to vessels. Then La Gorgona, a larger island, and Capraia, the Greek name of which is Aegilion, and also Giglio and Gianuto, in Greek Artemisia, both opposite the coast at Cosa, and Barpana, Menaria, Columbaria, Venaria, Elba with its iron mines, an island 100 miles round and 10 miles from Populonium, called by the Greeks Aethalia; the distance between Elba and Pianosa is 28 miles. After these beyond the mouths of the Tiber and off the coast of Antium is Astura, then Palmarola, Senone, and opposite to Formiae Ponza. In the gulf of Pozzuoli are Pandateria, Prochyta (so called not after Aeneas's nurse but because it was formed of soil deposited by the current from Aenaria). Aenaria (named from having given anchorage to the fleet of Aeneas but called Inarime in Homer) and Pithecusa (named not from its multitude of monkeys, as some people have supposed, but from its pottery factories). Between Posilippo and Naples is Megaris; then, 8 miles from Sorrento, Capri, celebrated for the Emperor Tiberius's castlethe island is 11 miles round; Leucothea; and out of sight. being on the edge of the African Sea, Sardinia, which is less than 8 miles from the end of Corsica, and moreover the channel is narrowed by the small islands called the Rabbit Warrens, and also by the islands of Caprera, and Fossa, from which comes the Greek name of the Straits themselves, Taphros.

7. The east coast of Sardinia is 188 miles long, the west coast 175, the south coast 77 and the north coast 125; its circumference is 565 miles; and at Cape Carbonara its distance from Africa is 200 miles and from Cadiz 1400. It also has two islands off Capo IFalcone called the Islands of Hercules, one off La Puuta dell'Alga called Santo Antiocho, and one off Cape Carbonara called Coltelalzo. Near it some authorities also place the island sof Berelis. Callodes and the one called the Baths of Hera. The best-known peoples in Sardinia are the Ilienses, Balari, Corsi (who occupy 18 towns), Sulcitani, Valentini, Neapolitani, Vitenses, Caralitani (who have the Roman citizenship), and the Norenses; and one colony called At Libiso's Tower. Sardinia itself was called by Timaeus Sandaliotis, from the similarity of its shape to the sole of a shoe, and by Myrsilus Ichnusa, from its resemblance to a footprint. Opposite to the Bay of Paestum is La Licosa, called after the Siren buried there; and opposite Velia are Pontia and Isacia, both included under the one name of the Oenotrides, which is evidence that Italy was once in the possession of the Oenotri; and opposite to Vibo are the small

islands called the Isles of Ithaca, from the watch-tower of Ulysses that stands there.

8. But before all the islands of the Mediterranean in renown stands Sicily, called by Thucydides Sicania and by a good many authors Triuacria or Trinacia from its triangular shape. The measurement of its circumference, according to Agrippa, is 528 miles. In former times it was attached to the southern part of Italy, but later it was separated from it by an overflow of the sea, forming a strait 15 miles long and 1 miles wide at the Royal Pillar: this monument of the formation of the gap is the origin of the Greek name of the town situated on the Italian coast, Rhegium. In these Straits is the rock of Scylla and also the whirlpool of Charybdis, both notoriously treacherous. Sicily itself is triangular in shape, its points being the promontory mentioned before named Pelorum. pointing towards Italy, opposite Scylla, Pachynum towards Greece, the Morea being 440 miles away, and Lilybaenm towards Africa, at a distance of 150 miles from the Promontory of Mercury and 190 from Gape Carbonara in Sardinia. The following are the distances of these promontories from one another and the length of the coast lines: from Pelorum to Pachynum by land is 186 miles, from Pachynum to Lilybaeum 200 miles, and from Lilybacum to Pelorum 142 miles.

Sicily contains five colonies and sixty-three cities and states. Starting from Pelorum, on the coast facing the Ionian Sea is the town of Messina, whose denizens called Mamertines have the Roman citizenship, the promontory of Trapani, the colony of Taormina, formerly Naxos, the river Alcantara, and Mount Etna with its wonderful displays of fire at night: the circuit of its crater measures 21 miles; the hot ashes reach as far as Taormina and Catania. and the noise to Madonia and Monte di Mele. Then come the three Rocks of the Cyclopes. the Harbour of Ulysses, the colony of Catania, and the rivers Symaethum and Terias. Inland are the Laestrygonian Plains. Then there are the towns of Lentini, Megaris, the river Porcaro, the colony of Syracuse with the Spring of Axethusa (although the territory of Syracuse is also supplied with water by the springs of Temenitis, Archidemia, Magea, Cyane and Milichie), the harbour of Naustathmus, the river Elorum, the promontory of Pachynum. On this side of Sicily are the river Hyrminus, the town of Camarina, the river Gelas; the town of Acragas, called Agrigentmn in our language; the colony of Thermae; the rivers Achates, Mazara, Hypsa and Selinus; the town of Lilybacum and the promontory to which it gives its name; Trapani, Mount Eryx, the towns of Palermo, Solunto, Himera with its river, Cephaloedis, Alintium, Agathyrnum; the colony of Tindari the town of Melazzo and the district of Pelorum from which we began.

In the interior the town having Latin rights are those of the Centuripini, Netini and Segestani; tributaries are Asaro, Nicolosi, Argiro, the Acestaei, the Acrenses, the Bidini, the peoples of Cassaro, Trapani, Ergetium, Orchula, Bryn, Butella, Castro Giovanni, Gangi, Gela, Galata, Tisa, Hermae, Hybla, Nicosia, Pantalica, Ilerbitenses, Saleni, Aderno, Imacara, Ipana, Iato, Mistretta, Magella, Mandri, Modica, Mineo, Taormina, Noara, Petra, Colisano, Alicata, Semelita, Scheria, Selinunte, Symaethus, Talaria, Itandazza, Troccoli, Tyracinum and Zancle, a Messenian settlement on the Straits of Sicily.

The islands on the side towards Africa are Oozo, adjacent Malta (which is 87 miles from Camerina and 113 from Lilybaeum), Pantellaria, Maretino, Limosa, Calata, Lampedosa, Aethusa (written by others Aegusa), Levanzo, Alicus (75 miles from Solunto), and Ustica opposite to Paropus. On the Italian side of Sicily facing the river Metaurus, at a distance of nearly 25 miles from Italy, are the seven islands called the Aeolian and also the Liparean: their Greek name is the Hephaestiades, and the Roman Vulcan's Islands; they are called Aeolian from King Aeolus who reigned there in the Homeric period.

9. Lipari, with a town possessing rights of Roman citizenship, takes its name from King Liparus, who succeeded Aeolusit was previously called Milogonis or Meligunis; it is 25 miles from Italy, and its circumference measures a little less than 5 miles. Between it and Sicily is another island formerly called Therasia, and now Holy Island because it is sacred to Vulcan, on it being a hill that vomits out flames in the night. The third island is Stromboli, six miles to the east of Lipari; here Aeolus reigned. It differs from Lipari only in the fact that its flame is more liquid; the local population are reported to be able to foretell from its smoke three days ahead what winds are going to blow, and this is the source of the belief that the winds obeyed the orders of Aeolus. The fourth of the islands, Didyme, is smaller than Lipari. The fifth, Eriphusa, and the sixth, Phoenicusa, are left to provide pasture for the flocks of the neighbouring islands; the last and also the smallest is Euonymus. So far as to the first gulf of Europe.

10. At Locri begins the projection of Italy called Magna Graecia, retiring into the three bays of the Ausonian Sea, so called from its first inhabitants the Ausones. According to Varro its length is 86 miles, but most authorities have made it 75. On this coast are rivers beyond count; but the places worthy of mention, beginning at Locri, are the Sagriano and the ruins of the town of Caulon, Monasteraci, Camp Consilinum, Punta di Stilo (thought by some to be the longest promontory in Italy), then the gulf and city of Squillace, called by the Athenians when founding it Scylletium. This part of the country is made into a peninsula by the Gulf of Santa Eufemia which runs up to it, and on it is the harbour called Hannibal's Camp. It is the narrowest part of Italy, which is here 20 miles across, and consequently the elder Dionvsius wanted to cut a canal across the peninsula in this place, and annex it to Sicily. The navigable rivers in this district are the Corace, Alli, Simari, Crocchio and Tacina; it contains the inland town of Strongolo, the range of Monte Monacello, and the promontory of Lacinium, off the coast of which ten miles out lies the Island of the Sons of Zeus and another called Calvpso's Island, which is thought to be Homer's island of Ogygia, and also Tyris, Ernnusa and Meloessa. According to Agrippa the distance of the promontory of Lacinium from Caulon is 70 miles.

11. At the promontory of Lacinium begins the second Gulf of Europe; it curves round in a large bay and ends in Acroceraunium, a promontory of Epirus; the distance from cape to cape is 75 miles. Here are the town of Crotona, the river Neto, and the town of Turi between the river Crati and the river Sibari, on which once stood the city of the same name. Likewise Heraclea, once called Sins, lies between the Sins and the Aciris. Then the rivers Salandra and Bassiento, and the town of Torre di Mare, at which the third region of Italy ends. The only inland community of the Bruttij are the Aprustani, but in the interior of Lucania are the Atinates. Bantini, Eburini, Grumentini, Potentini, Sontini, Sirini, Tergilani, Ursentini and Volcentani adjoining whom are the Numestrani. Moreover it is stated by Cato that the town of Thebes in Lucania has disappeared and Theopompus says that there was once a city of the Lucanians named Mardonia, in which Alexander of Epirus died.

Adjoining this district is the second region of Italy, embracing the Hirpini, Calabria, Apulia and the Sallentini with the 250-mile bay named after the Laconian town of Taranto (this is situated in the Nipnermost recess of the bay and has had attached to it the sea-board colony that had settled there, and it is 136 miles distant from the promontory of Lacinium), throwing out Calabria which is opposite to Lacinium to form a peninsula. The Greeks called it Messapia from their leader Messapus, and previously Peucetia from Peucetius the brother of Oenotrius, and it was in the Sallentine territory.

The distance between the two headlands is 100 miles: and the breadth of the peninsula overland from Taranto to Brindisi is 35 miles, and considerably less if measured from the port of Sasine. The towns inland from Taranto are Uria, which has the surname of Messapia to distinguish it from Uria in Apulia, and Sarmadium; on the coast are Senum and Gallipoli, the present Anxa, 75 miles from Taranto. Next, 33 miles farther, the promontory called the Iapygian Point, where Italy projects farthest into the sea. Nineteen miles from this point are the towns of Vaste and Otranto, at the boundary between the Ionian Sea and the Adriatic, where is the shortest crossing to Greece, opposite to the town of Apollonia, separated by an arm of the sea not more than 50 miles wide. King Pyrrhus of Epirus first conceived the plan of carrying a causeway over this gap by throwing bridges across it, and after him Marcus Varro had the same idea when commanding the fleets of Pompey in the Pirate War; but both were prevented by other commitments. After Otranto comes the deserted site of Soletum, then Fratuertium, the harbour of Taranto, the roadstead of Miltope, Lecce, Baleso, Cavallo, and then Brindisi, 50 miles from Otranto, one of the most famous places in Italy for its harbour and as offering a more certain crossing albeit a longer one, ending at the city of Durazzo in Illyria, a passage of 225 miles.

Adjacent to Brindisi is the territory of the Paediculi, whose twelve tribes were the descendants of nine youths and nine maidens from the Illyrians. The towns of the Paediculi are Ruvo, Agnazzo and Ban; their rivers are the lapyx, named from the son of Daedalus, the king who also gives his name to the lapygian Point, the Pactius and the Aufidus, which runs down from the Hirpini mountains and past Canossa.

Here begins Apulia, called Apulia of the Daunii, who were named after their chief, the father-in-law of Diomede; in Apulia is the town of Salpi, famous as the scene of Hannibal's amour with a courtezan, Sipontum, Uria, the river Cervaro marking the boundary of the Daunii, the harbour of Porto Greco, the promontory of Monte Gargano (the distance round Gargano from the promontory of Sallentinum or Iapygia being 234 miles), the port of Varano, the lake of Lesina, the river Frento which forms a harbour, Teanum of tile Apuli and Larinum of the Apuli, Cliternia, and the river Biferno at which begins the district of the Frentani Thus the Apulians comprise three different races: the Teani so called from their chief, of Graian descent; the Lucanians who were subdued by Calchas and who occupied the places that now belong to the Atinates; and the Daunians, including, beside the places mentioned above, the colonies of Lucera and Venosa and the towns of Canossa and Arpa, formerly called

Argos Hippium when founded by Diomede, and afterwards Argyripa. Here Diomede destroyed the tribes of the Monadi and Dardi and two cities whose names have passed into a proverbial joke, Apina and Trica. Besides these there are in the interior of the second region one colony of the Hirpini formerly called Maleventum and now more auspiciously, by a change of name, Beneventum, the Ausculani, Aquiloni, Abellinates snrnamed Protropi, Compsani, Candini, Ligurians with the surnames Baebiani, Vescellani, Aeclani, Aletrini, Abellinates surnamed Marsi, Atrani, Aceani, Alfellani, Atinates, Arpani, Boreani, Collatini, Corinenscs, Cannae celebrated for the Roman defeat, Dirini, Forentani, Genusini, Herdonienses, Irini, Larinates surnamed Frentani, the Merinates from Monte Gargano, Mateolani, Neretini, Natini, Rubustini, Silvini, Strapellini, Turnantini, Vibinates, Venusini, Ulurtini. Inland Calabrian peoples are the Aegetini, Apamestini, Argentini, Butuntinenses, Deciani, Grumbestini, Palionenses, Stulnini and Tutini; inland Norbanenses, Sallentini are the Aletini, Basterbint Neretini, Uzentini and Veretini.

12. There follows the fourth region, which includes the very bravest races in Italy. On the coast, in the territory of the Frentani, after Tifernum are the river Trigno, affording a harbour, and the towns of Histonium, Buca and Hortona and the river Aternus. Inward are the Anxani surnamed Frentani, the Upper and Lower Caretini and the Lanuenses; and in the Marrucine territory Chieti; in the Paelignian, the people of Corfinium; Subequo and Sulmona; in the Marsian. those of Lanciano, Atina, Fucino, Lucca and Muria: in the Albensian region the town of Alba on Lake Fucino; in the Aequicuian, Cliternia and Carsoli; in the Vestinian, Sant Angelo, Pinna and Peituina, adjoining witch is Ofena South of the Mountain; in the region of the Samnites, who once were called Sabelli and by the Greeks Saunitae, the colony of Old Bojano and the other Bojano that bears the name of the Eleventh Legion. Alfidena, Isernia, Fagifulani, Ficolea, Supino, and Terevento; in the Sabine, Amiternum, Correse, Market of Decius, New Market, Fidenae, Ferano, Noreia, La Mentana, Rieti, Trebula Mutuesca, Trebula Suffena, Tivoii, Tarano. In this district, of the tribes of the Aequicoli the Comini, Tadiates, Caedici and Alfaterni have disappeared. It is stated by Gellianus that a Marsian town of Arehippe, founded by the Lydian commander Marsyas, has been submerged in Lake Fucino, and also Valerian says that the town of the Vidicini in Picenum was destroyed by the Romans. The Sabines (according to some opinions called Sebini from their religious beliefs and ritual) live on the lush dewy hills by the Lakes of Velino Those lakes drain into the river Nera which from these derives the river Tiber with its sulphurous waters, and they are replenished by the Avens which runs down from Monte Fiscello near the Groves of Vacuna and Rieti and loses itself in the lakes in question. In another direction the Teverone rising in Mount Trevi drains into the Tiber three lakes famous for their beauty, from which Subiaco takes its name. In the district of Rieti is the lake of Cutilia, which is said by Marcus Varro to be the central point of Italy, and to contain a floating island. Below the Sabine territory lies Latium, on one side of it Picenum, and behind it Umbria, while the ranges of the Apennines fence it in on either side.

13. The fifth region is that of Picenum, which formerly was very densely populated: 360,000 Picentines took the oath of allegiance to Rome. They derived their origin from the Sabines, who had made a vow to celebrate a Holy Spring. The territory that they took possession of began at the river Aterno, where are now the district and colony of Adria, 6 miles from the sea. Here is the river Vomanus, the territories of Praetutia and Palma, also the New Camp, the river Batinus, Tronto with its river, the only Liburnian settlement left in Italy, the river Albula, Tessuinum, and Helvinum where the region of the Praetutii ends and that of Picenum begins; the town of Cupra, Porto di Fermo, and above it the colony of Ascoli, the most famous in Picenum. Inland is Novana, and on the coast Cluana, Poteatia, Numana founded by the Sicilians, and Ancona, a colony founded by the same people on the promontory of Cunerus just at the elbow of the coast where it bends round, 183 miles from Monte Gargano. Inland are Osimo, Beregra, Cingula, Cupra surnamed Montana, Falerona, Pausnla, Plalina, Iticinum, Septempedum, Tollentinum, Treia, and the people from Pollentia settled at Urbisaglia.

14. Adjoining to this will come the sixth region, embracing Umbria and the Gallic territory this side Rimini. At Ancona begins the Gallic coast named Gallia Togata. The largest part of this district was occupied by Sicilians and Liburnians, especially the territories of Palma, Praetutia and Adria. They were expelled by the Umbrians, and these by Etruria, and Etruria by the Gauls. The Umbrians are believed to be the oldest race of Italy, being thought to be the people designated as Ombrii by the Greeks on the ground of their having survived the rains after the flood. We find that 300 of their towns were conquered by the Etruscans. On this coast at the present time are the river Esino, Sinigagha, the river Meturo and the colonies of Fano and Pesaro with the river of the same name and inland those of Spello and Todi. Besides these there are the peoples of Amelia, Attiglio, Assisi, Ama, Iesi, Camerino, Casuentillum, Carsulae; the Dolates surnamed Sallentini; Foligno, Market of Flaminius, Market of Julius, surnamed Concupium, Market Brenta, Fossombrone, Gubbio, Terni on the Nera, Bevagna, Mevanio, Matilica, Narni (the town formerly called Nequinum); the people of Nocera surnamed Favonienses and those surnamed Camellani: Otricoli, Ostra; the Pitulani surnamed Pisuertes and others surnamed Mergentini; the Plestini; Sentinum, Sassina, Spoleto, Suasa, Sestino, Sigello, Tadina, Trevi, Tuficum, Fifernum on the Tiber, Tifernum on the Meturo; Vesinica, Urbino on the Meturo and Urbino of the Garden, Bettona, the Vindinates and the Visuentani. Peoples that have disappeared in this district are the Felighates and the inhabitants of Clusiolum above Interainna, and the Sarranates, together with the towns of Acerrae surnamed Vafriae and Turocaelum surnamed Vettiolum; also the Solinates, Suriates, Falinates and Sappinates. There have also disappeared the Arinates with the town of Crinivolum and the Usidicani and Plangenses, the Paesinates, the Caelestini. Ameria above-mentioned is stated by Cato to have been founded 963 years before the war with Perseus.

15. The boundaries of the eighth region are marked by Rimini, the Po and the Apennines. On its coast are the river Conca, the colony of Rimini with the rivers Ariminum and Aprusa, and the river Rubicon, once the frontier of Italy. Then there are the Savio, the Bevano and the Roneone; the Sabine town of Ravenna with the river Montone, and the Umbrian town of Butrium 105 miles from Ancona and not far from the sea. Inland are the colonies of Bologna (which at the time when it was the chief place in Etruria was called Felsina), Brescello, Modena, Parrna, Piacenza, and the towns of Cesena, Quaderna, Fornocchia, Forli, Forli Piccolo, Bertinoro, Cornelius Market, Incino, Faenza, Fidentia, Otesini, Castel Bondino, Reggio named from Lepidus, Citt di Sole, Groves of Gallius surnamed Aquinates. Tenedo, Villac in old days surnamed Regias, Urbana. Peoples no longer existing in this region are the Boiip said by Cato to have comprised 112 tribes, and also the Senones who captured Rome.

16. The source of the Po, which well deserves a visit, is a spring in the heart of Monte Viso, an extremely lofty Alpine peak in the territory of the Ligurian Vagienni: the stream burrows underground and emerges again in the district of Vibius Market. It rivals all other rivers in celebrity; its Greek name was Eridanus, and it is famous as the scene of the punishment of Phaethon. The melting of the snows at the rising of the Dogstar causes it to swell in volume; but though its flooding does more damage to the fields adjacent than to vessels, nevertheless it claims no part of its plunder for itself. and where it deposits its spoil it bestows bounteous fertility. Its length from its source is 300 miles, to which it adds 88 by its windings, and it not only receives navigable rivers from the Apennines and the Alps, but also immense lakes that discharge themselves into it, and it carries down to the Adriatic Sea as many as 30 streams in all. Among these the best-known are: flowing from the Apennine range, the Jactum, the Tanaro, the Trebbia (on which is Piacenza), the Taro, the Euza, the Secchia, the Panaro and the Reno; flowing from the Alps, the Stura, Orco, two Doras, Sesia, Ticino, Lambra, Adda, Oglio and Mincio. Nor does any other river increase so much in volume in so short a distance: in fact, the vast body of water drives it on and scoops out its bed with disaster to the land, although it is diverted into streams and canals between Ravenna and Altino over a length of 120 miles; nevertheless where it discharges its water more widely it forms what are called the Seven Seas.

The Po is carried to Ravenna by the Canal of Augustus; this part of the river is called the Padusa, nearest to Ravenna forms the large basin called the Harbour of the Santerno; it was here that Claudius Caesar sailed out into the Adriatic, in what was a vast palace rather than a ship, when celebrating his triumph over Britain. This mouth was formerly called the Eridanus, and by others the Spineticus from the city of Spina that formerly stood near it, and that was believed on the evidence of its treasures deposited at Delphi to have been a very powerful place; it was founded by Diomede. At this point the Po is augmented by the river Santerno from the territory of Cornelius Market.

The next mouth to this is the Caprasian month, then that of Sagis, and then Volane, formerly called Olane; all of these form the Flavian Canal, which was first made from the Sagis by the Tuscans, thus discharging the flow of the river across into the marshes of the Atriani called the Seven Seas, with the famous harbour of the Tuscan town of Atria which formerly gave the name of Atriatic to the sea now called the Adriatic. Next come the deep-water mouths of Carbonaria and the Fosses of Philistina, called by others Tartarus, all of which originate from the overflow of the Philistina Canal, with the addition of the Adige from the Trentino Alps and of the Bacchiglione from the district of Padua. A part of these streams also forms the neighbouring harbour of Brondolo, as likewise that of Chioggia is formed by the Brenta and Brentella and the Clodian Canal. With these streams the Po unites and flows through them into the sea, according to most

authorities forming between the Alps and the sea-coast the figure of a triangle, like what is called the Delta formed by the Nile in Egypt; the triangle measures 250 miles in circumference. One is ashamed to borrow an account of Italy from the Greeks; nevertheless, Metrodorus of Scepsis says that the river has received the name of Padus because in the neighbourhood of its source there are a quantity of pine-trees of the kind called in the Gallic dialect padi, while in fact the Ligurian name for the actual river is Bodincus, a word that means 'bottomless.' This theory is supported by the fact that the neighbouring town of Industria, where the river begins to be particularly deep, had the old name of Bodincomagum.

17. The eleventh region receives from the river the name of Transpadana; it is situated entirely inland, but the river carries to it on its bounteous channel the products of all the seas. Its towns are Seluzzo and Susa, and the colony of Turin at the roots of the Alps (here the Po becomes navigable), sprung from an ancient Ligurian stock, and next that of Aosta Praetoria of the Salassi, near the twin gateways of the Alps, the Graian pass and the Pennine, history says that the latter was the pass crossed by the Carthaginians and the former by Herculesand the town of Ivrea, founded by the Roman nation by order of the Sibylline Booksthe name comes from the Gallic word for a man good at breaking horsesVercelli, the town of the Libicii, founded from the Sallui, and Novara founded from Vertamacon, a place belonging to the Vocontii and nowadays a village, not (as Cato thinks) belonging to the Ligurians: from whom the Laevi and Manici founded Ticinum not far from the Po, just as the Bojans, coming from the tribes across the Alps, founded Lodi and the Insubrians Milan. According to Cato, Como, Bergamo, Incino and some surrounding peoples are of the Orumbivian stock, but he confesses that he does not know the origin of that race; whereas Cornelius Alexander states that it originated from Greece, arguing merely by the name, which he renders 'those who pass their lives in mountains.' In this locality a town of the Orumbivii named Parra, said by Cato to be the original home of the people of Bergamo, has perished, its remains still showing its site to have been more lofty than advantageous. Other communities that have perished are the Caturiges, an exiled section of the Insubrians, and the above-mentioned Spina, and also the exceptionally wealthy town of Melpum. which is stated by Cornelius Nepos to have been destroyed by the Insubrians, Boii and Senones on the day on which Camillus took Veii.

18. Next comes the tenth region of Italy, on the coast of the Adriatic Sea. In it are Venetiay the river Silo that rises in the mountains of Treviso, the town of Altino, the river Liquenzo rising in the mountains of Oderzo, and the port of the same name, the colony of Coneordia, the river and port of Rieti, the Greater and Lesser Tagliamento, the Stella, into which flows the Revonchi, the Aba, the Natisone, with the Torre that flows past the colony of Aquileia situated 15 miles from the sea. This is the region of the Carni, and adjoining it is that of the Iapudes, the river Timavo, Castel Duino, famous for its wine, the Gulf of Trieste, and the colony of the same name, 33 miles from Aqnileia. Six miles beyond Trieste is the river Formio, 189 miles from Ravenna, the old frontier of the enlarged Italy and now the boundary of Istria. It has been stated by many authors, even including Nepos, who lived on the banks of the Po, that Istria takes its name from the stream called Ister flowing out of the river Danube (which also has the name of Ister) into the Adriatic, opposite the mouths of the Po, and that their currents, colliding from contrary directions, turn the intervening sea into a pool of fresh water; but these statements are erroneous, for no river flows out of the Danube into the Adriatic. I believe that they have been misled by the fact that the ship Argo came down a river into the Adriatic not far from Trieste, but it has not hitherto been decided what river this was. More careful writers say that the Argo was portaged on men's shoulders across the Alps, but that she had come up the Ister and then the Save and then the Nauportus, a stream rising between Emona and the Alps, that has got its name from this occurrence.

19. Istria projects in the form of a peninsula. Some authorities have given its breadth as 40 miles and its circuit as 125 miles, and the same dimensions for the adjoining territory of Liburnia and the Flanatic Gulf; others make it 225 miles, and others give the circuit of Liburnia as 180 miles. Some carry lapudia, at the back of Istria, as far as the Flanatic Gulf, a distance of 130 miles, and then make the circuit of Liburnia 150 miles. Tuditanus, who conquered the Istrians, inscribed the following statement on his statue there: From Aquileia to the river Keriko 2000 furlongs. Towns in Istria with the Roman citizenship are Aegida, Parenzo and the colony of Pola, the present Pietas Julia, originally founded by the Colehians, and 105 miles from Trieste. Then comes the town of Nesactium and the river Arsa, now the frontier of Italy. The distance across from Ancona to Pola is 120 miles.

In the interior of the tenth region are the colonies of Cremona and Brescia in the territory of the Cenomani, and Este in that of the Veneti, and the towns of Asolo, Padua, Oderzo, Belluno, Vicenza and Mantua, the only remaining Tuscan town across the Po. According to Cato, the Veneti are descended from a Trojan stock, and the Cenomani lived among the Volcae in the neighbourhood of Marseilles. There are also the Rhaetic towns of Feltre, Trent and Berua, Verona which belongs to the Rhaeti and Euganei jointly, and Zuglio which belongs to the Carni; then peoples that we need not be concerned to designate with more particularity, the Alutrenses, Asseriates, Flamonienses Vanienses and other Flamonienses surnamed Curici, the Forojulienses surnamed Transpadani, Foretani, Nedinates, Quarqueni, Tarvisani, Togienses, Varvari. In this district there have disappeared, on the coast-line, Irrnene, Pellaon, Palsiciurn, Atina and Caelina belonging to the Veneti, Segesta and Ocra to the Carni, Noreia to the Taurisci. Also Lucius Piso states that a town 12 miles from Aquileia was destroyed by Marcus Claudius Marcehlus, although against the wish of the Senate.

This region also contains eleven famous lakes and the rivers of which they are the source, or which, in the case of those that after entering the lakes leave them again, are augmented by themfor instance the Adda that flows through Lake Como, the Ticirio through Maggiore, the Mincio through Garda, the Seo through the Lago di Seo, and the Lambro through Lago di Pusiano--all of these streams being tributaries of the Po.

The length of the Alps from the Adriatic to the Mediterranean is given by Caelius as 1000 miles; Timagenes puts it at 25 miles less. Their breadth is given by Cornelius Nepos as 100 miles, by Livy as 375 miles, but they take their measurements at different points; for occasionally the Alps exceed even 100 miles in breadth, where they divide Germany from Italy, while in the remaining part they are as it were providentially narrow and do not cover 70 miles. The breadth of Italy at the roots of the Alps, measured from the river Var through Vado, the port of Savo, Turin, Como, Brescia, Verona, Vicenza, Oderzo, Aquileia, Trieste and Pola, to the river Ars, amounts to 745 miles.

20. The Alps are inhabited by a great many nations, but the notable ones, between Pola and the district of Trieste, are the Fecusses, Subocrini, Catali and Menoucaleni, and next to the Carni the peoples formerly called Taurisci and now Norici; adjoining these are the Raeti and Vindelici. All are divided into a number of states. The Raeti are believed to be people of Tuscan race driven out by the Gauls: their leader was named Raetus. Then, on the side of the Alps towards Italy, are the Euganean races having the Latin rights, whose towns listed by Cato number 34. Among these are the Triumpilini, a people that sold themselves together with their lands, and then the Camunni and a number of similar peoples, assigned to the jurisdiction of the neighbouring municipal towns. Cato before mentioned considers the Lepontii and Salassi to be of Tauriscan origin, but almost all other authors give a Greek interpretation to their name and believe that the Lepontii are descended from companions of Hercules 'left behind' because their limbs had been frostbitten in crossing the Alps; and that the inhabitants of the Graian Alps were also Grai from the same band, and that the Euganei were of specially distinguished family, and took their name from that fact; and that the head of these are the Stoeni. The Raetian tribes Vennones and Sarunetes live near the sources of the river Rhine, and the Lepontian tribe called the Uberi at the source of the Rhone in the same district of the Alps. There are also other native tribes that have received Latin rights; for instance, the Octodurenses and their neighborn the Centrones. the Cottian states and the Turi of Ligurian descent, the Ligurian Vagienni and those called the Mountain Ligurians, and several tribes of Long-haired Ligurians on the borders of the Ligurian Sea.

It seems not out of place to append here the inscription from the triumphal arch erected in the Alps, which runs as follows:

To the Emperor Caesar, son, of the late lamented Augustus, Supreme Pontiff in his fourteenth year of office as Commander-in-chief and seventeenth year of Tribunitial Authorityerected, by the Senate and People of Rome, to commemorate that under his leadership and auspices all the Alpine races stretching from the Adriatic Sea to the Mediterranean were brought under the dominion of the Roman people. Alpine races conqueredthe Triumpilini, Camunni, Venostes, Vennonetes, Isarehi, Breuni, Genaunes, Focunates, four tribes of the Vindelici, the Cosuanetes, Rucinates, Licates, Catenates, Ambisontes, Rugusci, Suanetes, Calucones, Brixentes, Leponti, Uberi, Nantuates, Seduni, Varagri, Salassi, Acitavones, Medulli, Ucenni, Caturiges, Brigiani, Sobionti, Brodicenti, Nemaloni, Edenates, Vesubiani, Veamini, Gallitae, Trizdlati, Ecdini, Vergunni, Eguituri, Nematuri, Oratelli, Nerusi, Felauni, Suetri.

This list does not include the 15 states of the Cottiani which had not shown hostility, nor those that were placed by the law of Pompeius under the jurisdiction of the municipal towns.

This then is Italy, a land sacred to the gods, and these are the races and towns of its peoples. Moreover this is that Italy which, in the consulship of Lucius Aemilius Papas and Gaius Atilius Regulus, on receipt of news of a rising in Gaul, singlehanded and without any alien auxiliaries, and moreover at that date without aid from Gaul north of the Po, equipped an army of 80,000 horse and 700,000 foot. She is inferior to no country in abundance of mineral products of every kind; but mining is prohibited by an old resolution of the Senate forbidding the exploitation of Italy.

21. The race of the Liburni stretches from the Arsa to the river Tityus. Sections of it were the Mentores, Himani, Eneheleae, Buni, and the people called by Callimachus the Peucetii, all of whom are now designated collectively by the one name of Illyrians. Few of the peoples are worthy of mention, nor are their names easy to pronounce. To the jurisdiction of Scardona resort the Iapudes and the 14 communities of the Liburni, of which it may not be tedious to name the Lacinienses, Stulpini, Burnistae and Olbonenses. In this jurisdiction states having Italic rights are the Alutae, the Flanates from whom the gulf takes its name, the Lopsi, the Varvarini, the Asseriates who are exempt from tribute, and of the islands Berwitch and Karek. Moreover along the coast starting from Nesactium are Albona, Fianona, Tersaet, Segna, Lopsico, Ortoplinia, Viza, Argyruntum, Carin, Nona, the city of the Pasini and the river Zermagna, at which Iapudia terminates. The islands of the gulf with their towns are, besides the above specified. Absortium. Arba, Cherso, Gissa, Portunata. Again on the mainland is the colony of Zara, 160 miles from Pola, and 30 miles from it the island of Mortero, and 18 miles from it the mouth of the river Kerka.

22. At the city of Scardona on the Kerka, 12 miles from the sea, Liburnia ends and Dalmatia begins. Then comes the ancient region of the Tariotares and the fortress of Tariona, the Promontory of Diomede, or as others name it the Peninsula of Hyllis, measuring 100 miles round, Tragurium, a place possessing Roman citizenship and famous for its marble, Siculi where the late lamented Claudius sent a colony of ex-service men; and the colony of Spalato, 112 miles from Zara. Spalato is the centre for jurisdiction of the Delmataei whose forces are divided into 342 tithings. Deuri into 25 tithings, Ditiones into 239, Maezaei 269, Sardeates 52. In this district are Burnum, Andetrium and Tribulium, fortresses that are famous for battles. Island peoples also belonging to the same jurisdiction are the Issaeans, Colentini, Separi and Epetini. After these come the fortresses of Pegunthim, Nareste and Onium, and the colony of Narenta, the seat of the third centre, 85 miles from Spalato, situated on the river also called Narenta 20 miles from the sea. According to Marcus Varro 89 states used to resort to it, but now nearly the only ones known are the Cerauni with 24 tithings, the Daursi with 17, Desitiates 103, Docleates 33, Deretini 14, Deraemestae 30, Dindari 33, Gunditiones 44, Melcumani 24, Naresi 102 Scirtari 72 Sicnlotae 24 and the Vardaei once the ravagers of Italy, with not more than 20 tithings. Besides these this district was occupied by the Ozuaei, Partheni, Hemasini, Arthitae and Armistae. The colony of Epidaurume is 100 miles distant from the river Naron. After Epidaurum come the following towns with Roman citizenshipRisine, Cattaro, Budua, Duleigno, formerly called Colchinium because it was founded by the Colehians: the river Drino, and upon it Scutari, a town with the Roman citizenship, 18 miles from the sea; and also a number of Greek towns and also powerful cities of which the memory is fading away, this district having contained the Labeatae, Endirudini, Sasaei and Grabaei: and the Taulanti and the Pyraei, both properly styled Illyrians. The promontory of Nymphaeum on the coast still retains its name. Lissum, a town having the Roman citizenship, is 100 miles from Epidaurum.

23. At Lissum begins the Province of Macedonia. Its races are the Partheni and in their rear the Dassaretae. The mountains of Candavia are 78 miles from Durazzo, and on the coast is Denda, a town with Roman citizenship, the colony of Epidamnum which, on account of the ill-omened sound of that name, has been renamed Dyrrachium by the Romans, the river Aous, called by some Aeas, and the former Corinthian colony of Apollonia 4 miles distant from the sea, in the territory of which is the famous Shrine of the Nymphs, with the neighbouring native tribes of the Amantes and Buliones. Actually on the coast is the town of Ericho, founded by the Colchians. Here begins Epirus, with the Acroceraunian mountains, at which we fixed the boundary of this Gulf of Europe. The distance between Ericho and Cape Leuca in Italy is 80 miles.

24. Behind the Carni and Iapudes, along the course of the mighty Danube, the Raetians are adjoined by the Norici; their towns are Wolk-Markt, Cilley, Lurnfelde, Innichen, Juvavum, Vienna, Clansen, Solfeld. Adjoining the Norici is Lake Peiso, and the Unoccupied Lands of the Boii, now however inhabited by the people of Sarvar, a colony of his late Majesty Claudius, and the town of Sopron Julia.

25. Then come the acorn-producing lands of the province of Pannonia, where the chain of the Alps gradually becomes less formidable, and slopes to the right and left hand with gentle contours as it traverses the middle of Illyria from north to south. The part looking towards the Adriatic is called Dalmatia and Illyria mentioned above, while 139 the part stretching northward is Pannonia, terminating in that direction at the Danube. In it are the colonies of Aemona and Siscia. Famous navigable rivers flowing into the Danube are the Drave from Noricum, a rather violent stream, and the Save from the Carnian Alps which is more gentle, there being a space of 120 miles between them; the Drave flows through the Serretes, Sirapilli, Iasi and Andizetes; the Save through the Colapiani and Breuci. These are the principal peoples; and there are besides the Arviates, Azali, Amantini, Belgites, Catari, Cornacates, IEravisci, Hercuniates, Latovici, Oseriates and Vareiani, and Mount Claudius, in front of which are the Scordisei and behind it the Taurisci. In the Save is the island of Zagrabia, the largest known island formed by a river. Other noteworthy rivers are the Culpa, which flows into the Save near Siscia, where its channel divides and forms the island called Segestica, and another river the Bossut, flowing into the Save at the town of Sirmich, the capital of the Sirmienses and Amantini. From Sirmich it is 45 miles to Tzeruinka, where the Save joins the Danube; tributaries flowing into the Danube higher up are the Walpo and the Verbas, themselves also not inconsiderable streams.

26. Adjoining Pannonia is the province called Moesia, which runs with the course of the Danube right down to the Black Sea, beginning at the confluence of the Danube and the Save mentioned above. Moesia contains the Dardani, Celegeri, Triballi, Timachi, Moesi, Thracians and Scythians adjacent to the Black Sea. Its famous rivers are the Morava, Bek and Timoch rising in the territory of the Dardani, the Iscar in Mount Rhodope and the Vid, Osma and Jantra in Mount Haemus.

Illyria covers 325 miles in width at its widest point, and 530 miles in length from the river Ama to the river Drin; its length from the Drin to the Promontory of Glossa is given by Agrippa as 175 miles, and the entire circuit of the Italian and Iulyrian Gulf as 1700 miles. This gulf, delimited as we described it, contains two seas, in the first part the Ionian and more inland the Adriatic, called the Upper Sea.

There are no islands deserving mention in the Ausonian Sea besides those already specified, and only a few in the Ionianthose lying on the coast of Galabria off Brindisi and by their position forming a harbour, and Diomede's Island off the coast of Apulia, marked by the monument of Diomede, and another island of the same name but by some called Teutria.

On the coast of Illyricum is a cluster of more than 1000 islands, the sea being of a shoaly nature and divided into a network of estuaries with narrow channels. The notable islands are those off the mouth of the Timavo, fed by hot springs that rise with the tide of the sea; Cissa near the territory of the Histri; and Pullaria and those called by the Greeks the Absyrtides, from Medea's brother Absyrtus who was killed there. Islands near these the Greeks have designated the Electrides, because amber, the Greek for which is electrum, was said to be found there; this is a very clear proof of Greek unreliability, seeing that it has never been ascertained which of the islands they mean. Opposite to the Zara are Lissa and the islands already mentioned; opposite the Liburni are several called the Crateae, and an equal number called the Liburnicae and Celadussae; opposite Surium Bavo and Brattia, the latter celebrated for its goats, Issa with the rights of Roman citizenship and Pharia, on which there is a town. Twenty-five miles from Issa is the island called Corcyra Melaena, with a town founded from Cnidos, and between Corcyra Melaena and Illyricum is Meleda, from which according to Callimachus Maltese terriers get their name. Fifteen miles from Meleda are the seven Stag Islands [So called from their combined outlines, Giupan forming the head, Ruda the neck, Mezzo the body, Calemotta the haunches and Grebini or Petini the tail.], and in the Ionian Sea twelve miles from Oricum is Sasena, notorious as a harbour for pirates.

NATURAL HISTORY BOOK 4

1. The third gulf of Europe begins at the Mountains of Khimarra and ends at the Dardaneiles. Its coast-line measures 1925 miles not including smaller bays. It contains Epirus, Acarnania, Aetolia, Phocis, Locris, Achaia, Messenia, Laconia, Argolis, Megaris, Attica and Boeotia; and again, on the side of the other sea, Phocis and Locris before-mentioned and Doris, Phthiotis, Thessaly, Magnesia, Macedonia and Thrace. All the legendary lore of Greece and likewise its glorious literature first shone forth from this gulf; and consequently we will briefly dwell upon it.

Epirus in the wide sense of the term begins at the Mountains of Khimarra. The peoples that it contains are first the Chaones who give their name to Chaonia, and then the Thesproti and Antigonenses; then comes the place called with exhalations that are noxious to birds, the Cestrini, the Perrhaebi to whom belongs Mount Pindus, the Cassiopaei, the Dryopes, the Selloi, the Hellopes, the Molossi in whose territory is the temple of Zeus of Dodona, famous for its oracle, and Mount Talarus, celebrated by Theopompus, with a hundred springs at its foot. Epirus proper stretches to Magnesia and Macedonia, and has at its back the Dassaretae above mentioned, a free race, and then the savage tribe of the Dardani. On the left side of the Dardani stretch the Triballi and the Moesic races, and joining them in front are the Medi and the Denseletae, and joining these the Thracians who extend all the way to the Black Sea. Such is the girdle that walls in the lofty heights of Despoto Dagh and then of the Great Balkan. On the coast of Epirus is the fortress of Khimarra on the Aeroceraunians, and below it the spring named the Royal Water and the towns of Maeandria and Cestria, the Thesprotian river Thyamis, the colony of Butrinto, and the very celebrated Gulf of Arta, whose inlet, half a mile wide, admits an extensive sheet of water, 37 miles long and 15 miles broad. Into it discharges the river Acheron flowing from the Acherusian Lake in Thesprotia, a course of 35 miles, and remarkable in the eyes of people who admire all the achievements of their own race for its 1000-foot bridge. On the gulf lies the town of Ambracia, and there are the Molossian rivers Aphas and Arta, the city of Anactoria and the place where Pandosia stood.

The towns of Acarnania, which was previously called Curetis, are Heraclia, Echinus, and, on the actual coast, the colony founded by Augustus, Actium, with the famous temple of Apollo, and the free city of Nicopolis. Passing from the Gulf of Ambracia into the Ionian Sea we come to the coast of Leucadia and Capo Ducato, and then to the gulf and the actual peninsula of Leucadia, formerly called Neritis, which by the industry of its inhabitants was once cut off from the mainland and which has been restored to it by the mass of sand piled up against it by the violence of the winds; the place has a Greek name meaning 'canalized,' and is 600 yards long. On the peninsula is the town of Leucas, formerly called Neritus. Then come the Acarnanian cities of Alvzia. Stratos. and Argos surnamed Amphilochian, and the river Achelous flowing from Mount Pindus and separating Acarnania from Aetolia; the continual deposits of earth that it brings down are linking the island of Artemita to the main land.

2. The Aetolian peoples are the Athamanes, Tymphaei, Ephyri, Aenienses, Perrhaebi, Dolopes, Maraces and Atraces in whose district is the source of the river Atrax that flows into the Ionian Sea. The towns of Aetolia are Calydon on the river Evenus seven miles and a half from the sea, and then Macynia and Molycria, behind which are Mount Chalcis and Taphiassus. On the coast is the Promontory of Antirrhium, at which is the mouth of the Gulf of Corinth, less than a mile broad, whose channel separates the Aetolians from the Morca. The promontory that juts out opposite is called Rhium. Aetolian towns on the Gulf of Corinth are Lepanto, Eupalimna, and inland Pleuron and Halicarna. Notable mountains are Tomarus in the district of Dodona, Crania in Ambracia, Aracynthus in Acarnania, and Achaton, Panaetolium and Macynium in Aetolia.

3 Next to the Aetolians are the Locrians surnamed Ozolae who are exempt from tribute. Here are the town of Oeanthe, the harbour of Apollo Phaestius and the gulf of Salona; and inland the towns of Argyna, Eupalia, Phaestum and Calamisus. Beyond are the Cirrhaean Plains of Phocis, the town of Cirrha and the port of Chalaeon, seven miles inland from which is Delphi, a free town at the foot of Mount Parnassus and the seat of the oracle of Apollo, the most famous in the world. Here are the Castalian Spring and the river Cephisus flowing past Delphi; it rises at the city of Lilaea. There was also formerly the town of Crisa, and together with the people of Bulis there are Anticyra, Naulochus, Pyrrha, the tax-free town of Salona, Tithrone. Tithorea, Ambrysus and Mirana, the district also called Daulis. Then right up the bay is the sea-board corner of Boeotia with the towns of Siphae and Thebes surnamed the Corsian, near Mount Helicon. The third town of Boeotia up from this sea is Pagae, from which projects the neck of the Morea

4. The Peloponnese, which was previously called Apia and Pelasgia, is a peninsula inferior in celebrity to no region of the earth. It lies between two seas, the Aegean and the Ionian, and resembles in shape the leaf of a plane-tree on account of the angular indentations the circuit of its coast-line, according to Isidore, amounts to 563 miles, and nearly as much again in addition, measuring the shores of the bays. The narrow neck of land from which it projects is called the Isthmus. At this place the two seas that have been mentioned encroach on opposite sides from the north and east and swallow up all the breadth of the peninsula at this point, until in consequence of the inroad of such large bodies of water in opposite directions the coasts on either side have been eaten away so as to leave a space between them of only five miles, with the result that the Morea is only attached to Greece by a narrow neck of land. The inlets on either side are called the Gulf of Lepanto and the Gulf of Egina, the former ending in Lecheae and the latter in Cenchreae. The circuit of the Morca is a long and dangerous voyage for vessels prohibited by their size from being carried across the isthmus on trolleys, and consequently successive attempts were made by King Demetrius, Caesar the dictator and the emperors Caligula and Nero, to dig a ship-canal through the narrow partan undertaking which the end that befell them all proves to have been an act of sacrilege! In the middle of this neck of land which we have called the Isthmus is the colony of Corinth, the former name of which was Ephyra; its habitations cling to the side of a hill, 7 miles from the coast on either side, and the top

of its citadel, called the Corinthian Heights, on which is the spring of Pirene, commands views of the two seas in opposite directions. The distance across the Isthmus from Leucas to Patras on the Gulf of Corinth is 88 miles. The colony of Patras is situated on the longest projection of the Peloponnese opposite to Aetolia and the river Evenus, separated from them at the actual mouth of the gulf by a gap of less than a mile, as has been said; but in length the Gulf of Corinth extends 85 miles from Patras to the Isthmus.

5. At the Isthmus begins the province named Achaia. It was previously called Aegialos on account of the cities situated in a row on its coast. The first place there is Lecheae the port of Corinth, already mentioned, and then come Olyrus the fortress of the people of Trikala, and the towns of Helice, and Bura and those in which their inhabitants took refuge when the former towns were swallowed up by the sea, namely Basilica, Palaeokastro, Vostitza and Artotina. Inland are Klenes and Hysiae. Then come the port of Tekieh and Rhium already described, the distance between which promontory and Patras which we have mentioned above is five miles; and then the place called Pherae. Of the nine mountains in Achaia the best known is Scioessa; and there is also the spring of Cyrnothoe. Beyond Patras is the town of Kato-Achaia, the colony of Dyme, the places called Buprasium and Llyrmine, the promontory of Capo Papa, the Bay of Cyllene, the promontory of Cape Tornese 5 miles from Cyllene, the fortress of Phlius, the district round which was called Araethyrea by Homer and afterwards Asopis.

Then begins the territory of the Eleans, who were formerly called the Epioi. Elis itself is in the interior, and 13 miles inland from Pilo is the shrine of Zeus of Olympus, which owing to the celebrity of its Games has taken possession of the calendar of Greece; here once was the town of Pisa on the banks of the river Thifla. On the coast are the promontory of Katakolo, the river Rufla, navigable for 6 miles, the towns of Aulon and Leprium, and the promontory of Platanodes, all these places lying westward. Southward are the Gulf of Cyparissus with the city of Cyparissus on its shore, which is 75 miles round, the towns of Pilo and Modon, the place called Helos, the promontory of Capo Gallo, the Asinaean Gulf named from the town of Asine and the Coronaean named from Corone: the list ends with the promontory of Cape Matapan. Here is the territory of Messenia with its 18 mountains, and the river Pyrnatza; and inland, the city of Messene, Ithome, Oechalia, Sareni, Pteleon, Thryon, Dorion and Zancle, all of them celebrated at different periods. The gulf measures 80 miles round and 30 miles across.

At Cape Matapan begins the territory of the free nation of Laconia, and the Laconian Gulf, which measures 106 miles round and 38 miles across. The towns are Kimaros, Amyclae, Chitries, Levtros, and inland Sparta, Therapne, the sites of the former Cardamyle, Pitane and Anthea, the place called Thyrea, Gerania, the mountain range of Pente Dactyli, the river Niris, the Gulf of Scutari, the town of Psamathus, the Gulf of Gytheum called from the town of that name, from which is the safest crossing to the island of Crete. All these places are bounded by the promontory of Capo Sant' Angelo.

The bay that comes next, extending to Capo Skyli, is called the Gulf of Nauplia; it is 50 miles across and 162 miles round. The towns on it are Boea, Epidaurus surnamed Limera, Zarax, and the port of Cyphanta. The rivers are the Banitza and the Kephalari, between which lies Argos surnamed Hippium, above the place called Lerne, two miles from the sea, and nine miles further on Mycenae and the traditional site of Tiryns and the place called Mantinea. The mountains are Malvouni, Fuka, Asterion, Parparus and others numbering eleven; the springs, Niobe, Amymone and Psamathe.

From Capo Skyli to the Isthmus of Corinth is 80 miles. The towns are Hermione, Troezen, Coryphasium and Argos, sometimes called Inachian Argos and sometimes Dipsian; then comes the harbour of Schoenitas, and the Saronic Gulf, formerly encircled with oak woods from which it takes its name, this being the old Greek word for an oak. On it is the town of Epidaurus famous for its shrine of Aesculapius; the promontory of Capo Franco; the ports of Anthedus and Bucephalus, and that of Cenchreae mentioned above, on the south side of the Isthmus, with the temple of Poseidon, famous for the Isthmian Games celebrated there every four years.

So many are the bays that pierce the coast of the Peloponnese, and so many seas howl round it, inasmuch as it is invaded on the north by the Ionian Sea, lashed on the west by the Sicilian, and beset by the Cretan on the south, by the Aegean on the south-east and on the north-east by the Myrtoan which starting at the Gulf of Megara washes the whole coast of Attica.

6. Most of the interior of the Peloponnese is occupied by Arcadia, which on every side is remote from the sea; it was originally called Drymodes, and later Pelasgis. Its towns are Psophis, Mantinea, Stymphalus, Tegea, Antigonea Orchomenus, Pheneus, Pallantium (from which the Palatium at Rome gets its name), Megalopolis, Gortyna, Bucohum, Camion, Parrhasia, Thelpusa, Melaenae, Heraea, Pylae, Pallene, Agrae, Epium, Cynaethae, Lepreon in Arcadia,

Copyright © 2018 by Lord Henfield, Guildford Scientific Press PAGE 3440 Parthenium, Alea, Methydrimn, Enispe, Macistum, Lampia, Clitorium and Cleonae. Between the last two towns is the district of Nemea commonly called Bembinadia. The mountains in Arcadia are Pholoe, with a town of the same name, Cyllene also with a town, Lycaeus on which is the shrine of Zeus Lycaeus, Maenalus, Artemisius, Parthenius, Lampeus, Nonacris, and also eight others of no note. The rivers are the Landona flowing from the marshes of Fonia and the Dogana flowing down from the mountain of the same name into the Alpheus. The remaining states in Achaia deserving of mention are those of the Alipheraei, Abeatae, Pyrgenses, Paroreatae, Paragenitae, Tortuni, Typanei, Thriusi and Tritienses. Freedom was given to the whole of Achaia by Domitius Nero. The Peloponnese measures 190 miles across from Cape Malea to the town of Vostitza on the Gulf of Corinth, and in the other direction 125 miles from ills to Epidauros and 68 miles from Olympia through Arcadia to Argos. (The distance between Olympia and Pylos has been given already.) Nature has compensated for the inroads of the sea by the mountainous character of the entire region, there being 76 peaks in all.

7. At the narrow part of the Isthmus begins Hellas, called in our language Greece. In this the first region is Attica, named in antiquity Acte. It touches the Isthmus with the part of it named Megaris, from Megara, the colony on the opposite side of the Isthmus from Pagae. These two towns are situated where the Peloponnese projects, and stand on either side of the Isthmus, as it were on the shoulders of Hellas. Pagae and also Aegosthena, being assigned to the jurisdiction of Megara. On the coast are the harbour of Porto Cocosi, the towns Leandra and Cremmyon, the Scironian Rocks six miles in length, Gerania, Megara and Levsina; formerly there were also Oenoe and Probalinthos. There now are the harbours of Piraeus and Phaleron, 55 miles from the Isthmus, and joined by wall to Athens 5 miles away. Athens is a free city, and requires no further advertisement here as her celebrity is more than ample. In Attica are the springs of Cephisia, Larine, and the Nine Wells of Callirrhoe, and the mountains of Brilessus, Aegialeus, Icarius, Hymettus and Lycabettus; the place called Hissus; the promontories of Capo Colonna, 45 miles from Piraeus, and Thoricos: the former towns of Potamos, Steria and Brauron, the village of Rhamnus, the place called Marathon, the Thriasian Plain, the town of Melita, and Ropo on the border of Boeotia.

To Boeotia belong Anthedon, Onchestus, the free town of Thespiae, Livadhia, and Thebes, surnamed Bueotian, which does not yield even to Athens in celebrity, and which is reputed to be the native place of two deities, Liber and Hercules. The Muses also are assigned a birthplace in the grove of Helicon. To this city of Thebes also are attributed the forest of Cithaeron and the river Ismenus. Besides these Boeotia contains the Springs of Oedipus and those of Psamathe, Dirce, Epicrane, Arethusa, Hippocrene, Aganippe and Gargaphie; and in addition to the mountains previously mentioned. Myealesus, Hadylius and Aeontius. The remaining towns between the Megarid and Thebes are Eleutherae, Haliartus, Plataea, Pherae, Aspledon, Hyle, Thisbe, Erythrae, Glissa, Copae, Lamiae and Anichiae on the river Cephisus, Medeon, Phlygone, Acraephia, Coronea and Chaeronea. On the coast below Thebes are Ocalee, Heleon, Scolos, Sehoenos, Peteon, Hyrie, Mycalesos, Ireseum, Pteleon, Olyarum, Tanagra Free State, and right in the channel of the Euripus. formed by the island of Euboea lying opposite, Aulis famous for its spacious harbour. The Boeotians had the name of Hyantes in earlier days. Then come the Locri surnamed Epicnemidii, and formerly called Leleges, through whose territory the river Cephisus flows down to the sea; and the towns of Opus, which gives its name to the Opuntian Bay, and Cynus. The only town of Phocis on the coast is Daphnus, but inland are Larisa. Elatea, and on the banks of the Cephisus, as we have said, Lilaea, and, facing Delphi, Cnemis and Hyampolis. Then there is the Locrian coast, on which are Larumna and Thronium, near which the river Boagrius flows into the sea, and the towns of Narycum, Alope and Scarphia. Afterwards comes the Malian Gulf named from its inhabitants and on it are the towns of Halcvone. Aeconia and Phalara.

Then comes Doris, in which are Sperchios, Frineon, Boion, Pindus and Cytinum. In the rear of Doris is Mount Oeta.

There follows Haemonia, which has often changed its name, having been successively called Pelasgis or Pelasgic Argos, and Hellas, Thessaly and Dryopis, always taking its surname from its kings: it was the birthplace of the king named Graecus from whom Greece is named, and of king Hellen from whom the Hellenes get their name. These same people are called by three different names in Homer, Myrmidons, Hellenes and Achaeans. The section of the Hellenes adjacent to Doris are named Phthiotae; their towns are Akhino and Heraclea, which takes the name of Trechin from the Pass of Thermopylae four miles away in the gorge of the river Ellada. Here is Mount Callidromus, and the notable towns are Hellas, Halos, Lamia, Phthia and Arne.

8. The places in Thessaly are Orchomenus, formerly called the Minyan, and the town of Alimon, otherwise Holmon, Atrax, Palamna, the Hyperian Spring, the towns of Pherae

(behind which lies Pieria spreading in the direction of Macedonia), Larisa, Gomphi, Thessalian Thebes, Elm Wood, the Gulf of Volo, the town of Pagasa subsequently called Demetrias, Tricca, the Pharsalian Plains with their free city, Crannon, Iletia. The mountains of Phthiotis are Nymphaeus, once so beautiful for its natural landscape gardening, Buzygaeus, Donaeoessa, Bromiaeus, Daphusa, Chimarone, Athamas, Stephane. In Thessaly there are 34. of which the most famous are Cercetii, Pierian Olympus and Ossa, facing which are Pindus and Othrys the abode of the Lapithaethese looking to the west; and looking east is Pelion; all form a curve like a theatre, and in the hollow in front of them lie 75 cities. Thessaly contains the rivers Apidanus, Phoenix, Enipeus, Onochonus and Pamisus; the spring Messeis; Lake Boebeis: and before all alike in celebrity the river Peneus. rising close to Gomphi and flowing down a wooded glen between Ossa and Olympus for 62 miles, for half of which distance it is navigable. Part of this course is called the Vale of Tempe, 5 miles long and nearly an acre and a half in breadth, with gently sloping hills rising beyond human sight on either hand, while the valley between is verdant with a grove of trees. Along it glides the Peneus, glittering with pebbles and adorned with grassy banks, melodious with the choral song of birds. Into it flows the river Orcus, to which it gives no intimate welcome, but merely carries it for a brief space floating on its surface like a skin of oil, in Homer's phrase, and then rejects it, refusing to allow the punitive waters engendered for the service of the Furies to mingle with its own silver flood.

9. Adjoining Thessaly is Magnesia, to which belong the spring Libethra, the towns of Iolcus, Ormenium, Pyrrha, Methone and Olizon, Cape Sepias, the towns of Castana and Spalathra, Cape Aeantium, the towns Meliboea, Ilhizus and Erymnae, the mouth of the Peneus, the towns Homoliuin, Orthe, Iresiae, Pelinna, Thanmacie, Gyrton, Crannon, Acharne, Dotion, Mehte, Phylace and Potniae.

The total length of Epirus, Achaia, Attica and Thessaly is said to be 490 miles and the total breadth of 297 miles.

10. Next comes Macedonia, with 150 nations, and famous for two kings a and for its former world-wide empire; it was previously called Emathia. It stretches westward to the races of Epirus, at the back of Magnesia and Thessalv, and on this side is exposed to the inroads of the Dardani, but its northern part is protected from the Triballi by Paeonia and Pelagonia. Its towns are Aegiae, the customary burial place of its kings, Beroea, and in the district called Pieria from the forest of that name, Aeginium. On the coast are Heraclea, the river Platamona, the towns of Pydna and Olorus, and the river Vistritsa, Inland are the Aloritae, Vallaei, Phylacaei, Cyrrestae and Tyrissaei, the colony of Pella, and the town of Stobi, which has the Roman citizenship. Then come Antigonea, Europus on the river Axius, and the town of the same name through which flows the Rhoedias, Scydra, Eordaea, Mieza and Gordvniae. Then on the coast Ichnae and the river Axius. The neighbours of Macedonia on this frontier are the Dardani, Treres and Pieres, and after the river Axius come the Paeonian races of the Paroraei, Eordenses, Almopi, Pelagones and Mygdones, and the mountains of Rhodope, Scopius and Orbelus; then, in the fold of ground lying in front of them, the Arethusii, Antiochienses, Idomenenses, Doberi, Aestrienses, Allantenses, Audaristenses, Morylli, Garresci Lyncestae, Othryonei, and the free peoples of the Amantini and Orestae; the colonies Bullidenses and Dienses; the Xylopolitae, the free Scotussaei, Heraclea Sintica, the Tymphaei, the Toronaei. On the Macedonian coast of the gulf are the town of Chalastra and, farther in, Pylorus, Lete, and at the centre of the curve of the coast the free city of Saloniki (from there to Durazzo is 245 miles), Therme, and on the Gulf of Saloniki the towns of Dicaea, Palinandrea and Scione, Cape Paliuri, and the towns of Pallene and Phlegra. The mountains in this district are Hypsizonus, Epitus, Algion and Elaeuonme; the towns are Nyssus, Phryxclon, Mendae, and on the isthmus of Pallene what was formerly Potidaea but is now the colony of Cassandrea, Anthemus, Olophyxus, Mecyberna Bay, the towns of Miscella, Ampelos, Torone, Singos, Telos, and the canal, a mile and a half in length, by which the Persian king Xerxes cut off Mount Athos a from the mainland The actual mountain projects from the level plain into the sea for a distance of 25 miles, and its circumference at its base amounts to 150 miles. There was once a town on its summit called Acrathoon; the present towns on it are Uranopolis, Palaehorium, Thyssus, Cleonae, and Apollonia, the inhabitants of which are called Macrobitc Then the town of Cassera, and the other side of the isthmus, Acanthus, Stagira, Sithone, Heraclea, and the district of Mygdonia lying below. in which at some distance from the sea are Apollonia and Arethtxsa, and on the coast again Posidium and the bay with the town of Cermorus, the free city of Amphipolis, and the tribe of the Bisaltae. Then comes the river Struma which rises in Mount Haemus and forms the boundary of Macedonia; it is worth recording that it spreads out into seven lakes before it proceeds on its course.

Such is Macedonia, which once won a worldwide empire, marched across Asia, Armenia, Iberia, Albania, Cappadocia, Syria, Egypt, Mount Taurus and the Hindu Kush, was lord over the Bactrians, Medes and Persians, owned the entire East, and even roamed in the tracks of Father Liber and of Hercules and conquered India; and this also is the Macedonia 72 of whose cities our general Aemilius Paullus pillaged and sold in a single day. So great the difference in her lot bestowed upon her by two individuals!

11. Next comes Thrace, one of the most powerful nations of Europe, divided into fifty commands.

Of its peoples those whom we ought not to omit to name are the Denseletae and the Medi, who live on the right bank of the river Struma right up to the Bisaltae above mentioned, and the Digerri and the various sections of the Bessi on the left bank, as far as the river Mesto that winds round the foot of Mount Pilat Tepeh, passing though the Haleti, Diobessi and Carbilesi, and then the Brysae, Sapaei and Odomanti. The race of the Odrysae owns the source of the Maritza, on the banks of which live the Cabyleti, Pyrogeri, Drugeri, Caenici, Hypsalti, Bent Corpi]li, Bottiaei and Edoni. In the same district are the Staletae, Priantae, Dolongae, Thyni, and the Greater Celaletae at the foot of the Great Balkan and the Lesser at the foot of Mount Rhodope. Between these tribes runs the river Maritza, and below Rhodope is the town formerly called Poneropolis, then Philippopolis after its founder, and now Trimontium from its site. To the summit of the Great Balkan is a journey of six miles. Its opposite side sloping down towards the Danube is inhabited by the Moesi, Getae, Aodi, Scaugdae and Clariae, and below them the Sarmatian Arraei called Areatae, and the Scythians, and round the shores of the Black Sea the Moriseni and the Sithoni, the ancestry of the poet Orpheus.

Thus Thrace is bounded by the Danube on the north, the Black Sea and Sea of Marmara on the east, and the Aegean Sea on the south, on the coast of which after leaving the Struma we come to Apollonia, Osima, Kavallo and Batos, Inland is the colony of Filiba, at a distance of 325 miles from Durazzo, Scotussa, the state of Topiros, the mouth of the river Mestus, the mountain of Pilat Tepeh, Melenik, Agia Maria, the free city of Abdera, the Lagos Buru and the people of the Bistoni. Here once was the town of Tirida, formidable on account of the stables of the horses of Diomede: and there now are the towns of Dicaea and Ismaron, the place called Parthenion, Phalesina, Marogna formerly called Orthagurea, Mount Serrium, Zone; and then the place called Doriscus, a plain large enough to hold 10,000 men, as it was in detachments of that number that Xerxes there counted his army; the month of the Maritza, the harbour of Stentor, the free town of Enos with the Euneral Mound of Polydorus a district formerly belonging to the Cicones. From Doriscus the coast makes a curve of 112 miles to Long Wall, round which flows the Black River that gives its name to the bay. The towns are Ipsala, Rodosto, Long Wall, so called because its fortifications extend between the two seas, from the Sea of Marmara to the Gulf of Enos, cutting off the projecting Gallipoli Peninsula For the other side of Thrace begins at the coast of the Black Sea where the Danube flows into it; and this region comprises its finest cities, Kostendsje, a colony from Miletus, Temesvar and Collat, formerly called Ccrbatis. It formerly had Heraclea and Bizone, which was swallowed up by an earthquake, and it still has the City of Dionysus, previously called Crunos, which is washed by the river Zyras. The whole of this region was occupied by the Scythian tribe called the Ploughmen, their towns being Aphrodisias, Libistus, Zygerc, Rhocobae, Eumenia, Parthenopolis and Gerania, stated to have been the abode of the race of Pigmies: their name in the local dialect used to be Catizi, and there is a belief that they were driven away by cranes. On the coast after the City of Dionysus come the Milesian colony of Varna, the river Daphne-Soul and the town of Four Roadsteads. The enormous ridge of the Great Balkan projecting into the Black Sea formerly had on its summit the town of Aristaeum, and on the coast now are Mission and Akiali on the former site of Messa. The region of Astice had a town of Anthium, which is now Apollonia. The rivers are the Panisos, Juras, Tearus, Orosines; the towns Tiniada, Midjeh, Zagora (with its marsh now called Deultum), a colony of veterans, and Phinopolis, near which are the Straits of Constantinople. From the mouth of the Danube to the outlet of the Black Sea was reckoned as 552 miles, but Agrippa made it 60 miles more; and from that point to the wall above mentioned is 150 miles, and from there to the end of the Gallipoli Peninsula 126 miles.

On leaving the Dardanelles we come to the Bay of Casthenes, the Old Men's Harbour and the other called the Women's Harbour, and the promontory of the Golden Horn, on which is the town of Byzantium, a a free state, formerly called Lygos; it is 711 miles from Durazzo, so great being the space of land between the Adriatic and the Sea of Marmara. There are the rivers Bathynias and Pidaras or Athidas, and the towns of Selymbria and Pidaras or Athidas, and the towns of selymbria and Pidaras or Athidas, and the towns of called of the kings of Thrace that is hated by swallows because of the outrage committed by Tereus, the district of Caenica, the colony of Flaviopolis on the site of the former town called Caela, and 50 miles from Vizia the colony of

Copyright © 2018 by Lord Henfield, Guildford Scientific Press PAGE 3441 Apros, which is 189 miles distant from Philippi. On the coast is the river Erkene, and once stood the town of Ganos: Lysimachea on the Gallipoli Peninsula is also now becoming deserted. But at this point there is another Isthmus which cut up marks similar narrows with the same name and is of about equal width; and in a not dissimilar manner two cities occupied the shores on either side. Pactve on the side of the Sea of Marmara and Cardia on that of the Gulf of Enos, the latter city taking its name from the conformation of the place: both were subsequently united with the city of Lysimachea, five miles from Long Wall. On the Marmara side of Gallipoli Peninsula were Tiristasis, Crithotes and Cissa lying on the Goat's River; and there is now Resisthos, 22 miles from the colony of Apros, opposite to the colony of Parium. Also the Dardanelles, which as we have said divide Europe from Asia by a space not quite a mile across, have four cities facing one another on the opposite sides, Gallipoli and Ialova in Europe and Lamsaki and Avido in Asia. Then on Gallipoli there is the promontory of Capo Helles opposite to Jeni-Hisari, on the slanting side of which is the Bitch's Tomb (the name given to the funeral mound of Hecuba), the naval station of the Greeks in the Trojan war, and a tower, the shrine of Protesilaus, and at the point of The peninsula, which is called Aeolium, the town of Elaeus. Then as you make for the Gulf of Enos you have the harbours of Coelos and Panormus and Cardia above mentioned.

This rounds off the third Gulf of Europe. The mountains of Thrace, beside those already mentioned, are Edonus, Gygemeros, Meritus and Melamphyllus; the rivers are the Bargus and the Syrmus, which fall into the Maritza. The length of Macedonia, Thrace and the Hellespont has been mentioned previously (some make it 720 miles); the breadth is 384 miles.

The Aegean Sea takes its name from an island, or more truly a rock suddenly springing out of the middle of the sea, between Tenos and Chios, named Aex from its resemblance to a she-goatall being the Greek word for the animal. In sailing from Achaia to Antandro, this rock is sighted on the starboard side, and it is a sinister threat of disaster. One section of the Aegean is distinguished as the Myrtoan Sea; it takes its name from the small island of Myrtos sighted as you sail from Geraestus in the direction of Macedonia, not far from Carystus in Euboea. The Romans call all these seas by two names, the Macedonian Sea wherever it touches Macedonia or Thraee and the Grecian Sea where it washes the coast of Greece; while the Greeks divide the Ionian Sea too into the Sicilian and the Cretan, named from the islands, and also give the name of Icarian to the part hetween Samos and Myconos, and the other Greek names are taken from the gulfs that we have mentioned.

12. So much for the arrangement of the seas and the nations in the third Gulf of Europe. The islands are as follows: opposite to Thesprotia, 12 miles from Buthrotus and also 50 from Acroceraunia, lies Corfu, with a city of the same name, a free state, and the town of Cassopo, and the temple of Jupiter Cassius; the island is 97 miles long. In Homer it has the names of Scheria and Phaeacia, and in Callimachus also that of Drepane. Several islands lie round it, especially Fano on the side towards Italy and Paxo and Antipaxo towards Leucadia, both 5 miles away from Corfu. Not far from these, lying off Corfu, are Ericusa, Marathe, Elaphusa, Malthace, Trachie, Pythionia, Ptychia and Tarachie, and off the promontory of Corfu called Capo Drasti the rock into which (according to the story, which is due to the similarity of shape) the ship of Ulysses was changed. Off Leucadia and Aetolia are a very large number, among which those called the Teleboides, and also by their inhabitants the Taphiae, are Taphias, Carnos, Oxia, and Princessa; off Aetolia are the Echinades, Aegialia, Cotonis, Thyatira, Geoaris, Dionysia, Cyrnns, Chalcis, Pinara, Nystrus. Off these out at sea lie Cephallenia and Zante, both free, Ithaca, Dulichium, Same, and Crocyle. Cephallenia, formerly called in Greek the Black Island, is 10 miles from Paxo, and measures 93 miles in circumference; Same has been demolished by the Romans, but still possesses three towns. Between Same and the coast of Achaia lies Zante, distinguished by its fine town and remarkable for the fertility of its soil; it was at one time called Hyrie. It is 25 miles from the southern part of Cephallenia, and on it is the celebrated mountain of Elatus. It measures 36 miles in circumference. At a distance of 15 miles from Zante is Ithaca, on which is Monte Stefano: its whole circumference measures 25 miles. The distance from it to the Peloponnesian promontory of Araxus is 15 miles. Off Ithaca in the open sea are Asteris and Prote, and off Zante at a distance of 35 miles to the south-east are the two Strophades, called by other people the Plotae. Off Cephallenia is Letoia, off Pylos the three Sphageae and off Messene the three Oenussae.

In the Messenian Gulf are the three Thyrides, and in the Gulf of Laconia Teganissa, Cothon and Cerigo with the town of that namethe former name of this island was Porphyris; it lies 5 miles from Cape Malea, which is dangerous to circumnavigate because of the narrowness of the strait. In the Gulf of Nauplia are Pityusa, Mine and Ephyre; opposite the territory of Hermione Tricarenus, Aperopia, Colonis and

Aristera; opposite that of Troezen, Calauria half a mile away, Plateis, Belbina, Lasia and Baucidias; opposite Epidaurus, Cecryphalos and Pityonesus 6 miles from the mainland. Fifteen miles from Pityonesus is Aegina, a free state, which is 18 miles long as you sail past it, and 20 miles distant from Piraeus, the port of Athens; its name used to be Oenone. Off the promontory of Spiraeum lie Eleusa, Adendros, the two Craugiae, the two Caeciae and Selacosa; and Aspis 7 miles from Cenchreae and Methurides in the Bay of Megara 4 miles; while Aegila is 15 miles from Cythera and 25 from the Cretan town of Phalasarna.

Crete itself stretches east and west with one side facing south and the other north; it is celebrated for the renown of its 100 cities. Dosiades held the view that it took its name from the nymph Crete, daughter of Hesperis, Anaximander that it was named from the king of the Curetes, Philistides of Mallos and Crates that it was first called Aeria and then subsequently Curetis; its Greek appellation, 'the Island of the Blest,' is thought by some to be due to the mildness of its climate. Its breadth nowhere exceeds 50 miles, its widest part being about the middle; its length is fully 270 miles and its circumference 589 miles; its longest side forms a curve towards the Cretan Sea which takes its name from it, its easternmost projection, Cape Samonium, pointing towards Rhodes and its westernmost, the Ram's Forehead, towards Cyrene.

The important cities of Crete are Phalasarna, Elaea, Cisamon, Pergamum, Cydonia, Minoium, Apteron, Pantomatrium, Amphomala, Rhithymna, Panhormum, Cytaeum, Apoilonia, Matium, Heraclea, Miletos, Ampelos, Hierapytna, Lebena and Hierapolis; and in the interior Gortyna, Phaestus, Cnossus, Polyrrhenum, Xlyrina, Lycastos, Rhamnus, Lyctus, Diuni, Asium, Pyloros, Rhytion, Elatos, Pherae, Holopyxos, Lasos, Eleuthernae, Therapnae, Marathusa, Gytisos, and about 60 other towns of which only the memory exists. The mountains are Cadistus, Ida, Dictynna and Corycus. The distance of the island at its promontory called the Ram's Forehead from the promontory of Cyrene named Phycus is stated by Agrippa to be 125 miles, and at Cadistus from Malea in the Morea 80; at the promontory of Samonium it is 60 miles west of the island of Skarpanto, which lies between it and Rhodes.

The remaining islands lying round Crete are towards the Morea, the two called Corycos and the two called Myla; on the north side having Crete on the right and opposite to Cydonea are Leuce and the two called Budroe, opposite to Matium is Dia, opposite to the promontory of Itanum are Onysia and Leuce, and opposite to Hierapytua Chrysa and Gaudos. In the same region are Ophiussa, Butoa and Rhamnus, and after rounding the Ram's Forehead the three called Acusagorus. Off the promontory of Samonium are the Phocoi, Platiae and Stirnides, and Naulochos, Harmedon and Zephyre.

Forming part of Hellas but still in the Aegean Sea are the Lichades, Searphia, Corese, Phocasia, and a number of others facing Attica that have no towns on them and are consequently unimportant. Opposite Eleusis is the famous island of Salamis. In front of it is Psyttalea, and, at a distance of 5 miles from Sunium, Helene. Then at the same distance from Helene is Ceos, called by some Romans Cea and by the Greeks also Hydrusa. This is an island that has been torn away from Euboea; it was formerly 64 miles long, but more recently about four-fifths of it lying in the direction of Boeotia has also been swallowed up by the sea, leaving the towns of Iulis and Carthaea, while Coresus and Grassy Island have disappeared. Varro states that this island used to export an exceptionally fine kind of cloth used for ladies' dresses.

Euboea itself also is sundered from Boeotia by so moderate a channel, the Euripus, that it is joined to the mainland by a bridge. At the south end it has two marked promontories, Capo Mandili pointing towards Attica and Kayo Doro towards the Dardanelles; at the north it has Cape Lithadha. Its breadth nowhere exceeds 40 miles and nowhere contracts below two miles; its length stretches along the whole of Boeotia from Attica to Thessaly and measures 150 miles, while its circumference is 365 miles. At its south-easternmost point its distance from the Dardanelles is 225 miles. Its notable cities were formerly Pyrrha, Porthmos, Nesos, Germthos, Oreus, Dium, Aedepsos, Ocha and Oechalia; those now noteworthy are Chalcis (opposite which on the mainland is Aulis), Geraestus, Eretria, Carystus, Oritanum and Artemisium, as well as the Spring of Arethusa, the river Lelantus and the warm springs known as the Hellopiae. Euboea is, however, still better known for the marble of Carystus. It used formerly to be called Chalcodontis or according to Dionysius and Ephorus Macris, but Macra according to Aristides, and according to Callidemus Chalcis, because copper was first discovered there; according to Menaechmus its name was Abantias, while in poetry it is commonly called Asopis.

In the Myrtoan Sea besides Euboea are many islands, the best known being Glauconnesus and the Aegila islands, and off Capo Mandili the Cyclades, lying round Delos in a circle which has given them their name. The first of these is Andro with a town of the same name, 10 miles from Mandili and 38 from Ceos. Myrsilus tells us that Ceos was once called Cauros. and later Antandros; Callimachus says it had the name of Lasia, others Nonagria or Hydrusa or Epagris. Its circuit measures 93 miles. At a distance of a mile from Andros and 15 miles from Delos is Tino, with a city of the same name; this island is 15 miles in length. Aristotle says that owing to its abundance of springs it once was called Hydrusa; others give its old name as Ophiusa. The other islands are: Mykono, with Mount Two Breasts, 15 miles from Delos; Siphnns, previously called Meropia and Ads, 28 miles round; Serpho 15 miles round; Prepesinthus; Cythnos; and by far the most famous of the Cyclades and lying in the middle of them, Delos, celebrated for its temple of Apollo and for its commerce. According to the story, Delos for a long time floated adrift; also it was the only island that down to the time of Marcus Varro had never felt an earthquake shock; Mucianus however states that it has suffered twice from earthquake. Aristotle has recorded that it owes its name to its having suddenly appeared emerging from the water; Aglaosthenes, however, calls it the Isle of Cynthus and others Quail Island Star Island Hare Island, Cloak Island, Dog Island, and Fiery Island because fire was first discovered there. It measures five miles in circumference. Its only eminence is Mount Cynthius.

Next to Delos is Rhene, which Anticlides calls Celadusa, and also Artemites and Celadine; Syros, stated by old writers to measure 20 miles in circuit, but by Mucianus 160 miles; Olearos; Pros, with the town of that name, 38 miles from Delos, famous for its marble, and originally called Platea and afterwards Minois. Seven and a half miles from Paros and 18 from Delos is Naxos with its town, which was called Strongyle and then Dia and afterwards the Island of Dionysus because of the fertility of its vineyards, and by others Little Sicily or Callipolis. Its circuit measures 75 miles and it is half as large again as Paros.

So far the islands are regarded as belonging to the Cyclades, but the remainder that follow are called the Sporades. They are Helene, Phacusa, Nicasia, Schinusa, Pholegandros and 38 miles from Naxos and the same number of miles in length, lcaros, which has given its name to the surrounding sea; it has two towns, a third having disappeared; it was formerly called Doliche or Long Island, also Fish Island. It lies 50 miles north-east of Delos and 35 miles from Samos; between Euboea and Andros there is a channel 10 miles wide, and the distance from lcaros to Geraestus is 112 miles.

After these no regular order can be kept, so the remaining islands shall be given in a group: Scyro; Nio, 18 miles from Naxos, venerable as the burial-place of Homer, 22 miles long, previously called Phoenice: Odia: Oletandros: Gioura, with a town of the same name, 15 miles in circumference, 62 miles distant from Andros; 80 miles from Gionra, Syrnos; Cynethus; Telos, noted for its unguent, and called by Callimachus Agathusa; Donusa; Patmos, 30 miles in circumference; the Corassiae, Lebitha, Lero, Zinari; Sikino, previously Oenoe; Heraclia or Onus: Casos or Astrahe: Kimoli or Echinusa: Milo, with the town of that name, called by Aristides Mimblis, by Aristotle Zephyria, by Callimachus, Mimallis and by Heraclides Siphis and Acytasthe most circular in shape of all the islands; Buporthmos; Machia; Hypere, formerly called Patage, or by others Platage, now Amorgo; Polyaegas; Sapyle; Santorin, called Fair Island when it first emerged from the water; Therasia subsequently detached from it, and Automate or Holy Island, which soon afterwards arose between the two, and Thia, which emerged near the same islands in our own day. The distance between Santorin and Nio is 25 miles.

There follow Lea, Ascania, Namphi, and Hippuris. Stampalia, a free state, measuring 88 miles in circumference, is 125 miles from Cadistus in Crete: Platea 60 miles from Stampalia, and Caminia 38 miles from Platea; Azibintha, Lamse, Atragia, Pharmacusa, Thetaedia, Karki, Kalymni with its town, Coos, Eulimna, and at a distance of 25 miles from it Skarpanto, which has given its name to the Carpathian Sea? From there to Rhodes, a southwest course, is 50 miles: from Skarpanto to Casus is 7 miles, from Casus to Cape Samonium in Crete 30. In the Euripus between Euboea and the mainland, almost at the first entrance, are the four Petaliae Islands, and at its outlet Talanti. The Cyclades and the Sporades are bounded on the east by the Asiatic coasts of the Icarian Sea, on the west by the Attic coasts of the Myrtoan Sea, on the north by the Aegean Sea and on the south by the Cretan and Carpathian coasts: these islands occupy an area 700 miles long and 200 miles broad.

Across the mouth of the Gulf of Volo lie Euthia, Trikeri, Skyro, previously mentioned, and in fact the outermost of the Cyclades and Sporades, Gerontia and Scandira; across the Gulf of Saloniki Lresia Solymnia, Eudemia and Nea, the last an island sacred to Minerva; across the Gulf of Athos lie four islands, Piperi with the town of that name and formerly called Evoenus, 9 miles off, Sciathos 15 miles, and Embro with its town 88 miles; the distance between Embro and Mastusia on the Gallipoli Peninsula is 22 miles. Embro is 62 miles in circuit; it is watered by the river lissus. Twenty-two miles from Embro is Stalimene, which lies 87 miles from Mount Athos; its circuit measures 115 miles, and on it are the towns of Hephaestia and Myrinathe market place of the latter is reached by the shadow of Mount Athos at midsummer. Six miles from Staliniene is Thasos, a free state, formerly called Aeria or Aethria; Abdera on the mainland is 22 miles from Thasos, and Athos 621 miles, and the island of Samothrace, a free state, off the river Maritza, is the same distance from Thasos, 32 miles from Embro, 22 from Stalimene, and 38 from the coast of Thrace; its circuit measures 35 miles, and on it rises Monte Nettuno, which is 10 miles high. Embro gives the worst anchorage for vessels of all the islands. It is mentioned by Callimachus under its ancient name of Dardania.

Between the Gallipoli peninsula and Samothrace, about 15 miles from each, is the island of Skopelo, and beyond it are Gethone, Lamponia, Alopeconnesus, which is not far from Coelos the port of Gallipoli, and some others of no importance. We may also specify the names of uninhabited islands in the Gulf so far as we have been able to ascertain them: Avesticos, Sarnos, Cissyros, Charbrusa, Calathusa, Scyllia, Dialeon, Dictaea, Melanthia, Dracanon, Arconesus, Diethusa, Ascapos, Capheris, Mesate, Aeantion, Pateronnesus, Pateria, Calathe, Neriphus, Pelendos.

The fourth of the great Gulfs of Europe begins at the Dardanelles and ends at the entrance of the Sea of Azov. But in order more easily to indicate the divisions of the Black Sea we must give a brief description of its shape as a whole. It is a vast body of water lying in front of Asia and shut out from Europe by the promontory of Gallipoli; but it forces aa entrance into the interior by a narrow winding channel, and separates Europe from Asia, as has been said, by a strait that is less than a mile wide. The first part of the narrows is called the Dardanelles; here the Persian king Xerxes made the bridge of boats across which he led his army. From there a narrow channel 86 miles long extends to the Asiatic city of Priapus; it was here that Alexander the Great crossed. From this point the water begins to widen out, and afterwards narrows again. The wide part is called the Sea of Marmara and the narrows the Straits of Constantinople; at the point where Xerxes' father Darius conveyed his forces across by means of a bridge it is 500 yards wide, and its entire length from the Dardanelles is 239 miles.

Then comes the vast extent of the Black Sea, formerly the Axenus, which encroaches on a large area of the continent, and with a great bend of its coasts curves back into horns and from them stretches out on either side, producing exactly the shape of a Scythian bow. In the middle of the curve it is joined by the mouth of the Sea of Azov; this aperture is called the Straits of Kertsch and measures two and a half miles across The distance in a straight line between the two straits, the Dardanelles and Kaffa, measures according to Polybius 500 miles. The whole circumference of the Black Sea according to Varro and the old authorities generally is 2150 miles, but Cornelius Nepos adds 350 miles, while Artemidorus makes it 2119 miles, Agrippa 2540, and Mucianus 2425. There is a similar difference of opinion as to the measurement of the European shore, some fixing it at 1479 miles and others at 1100. Marcus Varro gives the measurement as follows: from the mouth of the Black Sea to Apollonia 1871 miles; from there to Coliat the same; to the month of the Danube 125; to the Dnieper 250; to the town of Cherronesus of the Heraeleotae 375 miles; to Kertseh, by some called Bosporus, the last point on the coast of Europe, 2121 milesthe total making 13371 miles. Agrippa makes it 540 miles from Istamboul to the river Danube and 635 miles from the Danube to Kertseh.

The actual Sea of Azov, which receives the Don flowing down from the Itipaean Mountains, the river being the extreme boundary between Europe and Asia, is said to measure 1406, or according to other authorities 1125, miles in circumference. The distance in a straight line between the entrance of the Sea of Azov and the mouth of the Don is agreed to be 375 miles. The inhabitants of the coasts of this great Gulf as far as Istere have been mentioned in our account of Thrace.

We then come to the mouths of the Danube. It rises in Germany in the range of Mount Abnoua, opposite to the Gallic town of Ranricum, and flows for a course of many miles beyond the Alps, and through innumerable tribes, under the name of Danube; then its volume of water increases enormously and from the point where it first enters Illyria it is called the Hister; after receiving 60 tributary rivers, nearly half of which are navigable, it is discharged into the Black Sea by six vast channels. The first of these is the mouth of Piczina, close to the island of that name, at which the nearest channel, called the Holy River, is swallowed up in a marsh 19 miles in extent. Opening from the same channel and above Istere spreads a lake measuring 63 miles round, named the Saltings. The second is called the Narakian Mouth: the third next the island of Sarmatica. Fair Mouth: the fourth. False Mouth: then comes the island of Mosquito Crossing, afterwards the North Mouth and the Barren Mouth. These mouths are each of them so large that for a distance of forty miles, so it is said, the sea is overpowered and the water tastes fresh.

From this point all the races in general are Scythian, though various sections have occupied the lands adjacent to the coast, in one place the Getae, called by the Romans Dacians, at another the Sarmatae, called by the Greeks Sauromatae, and the section of them called Waggon-dwellers or Aorsi, at another the base-born Scythians, descended from slaves, or else the Cave-dwellers, and then the Alani and Rhoxolani. The higher parts between the Danube and the Hercynian Forest as far as the winter quarters of Pannonia at Carnuntum and the plains and level country of the German frontiers There are occupied by the Sarmatian Iazyges, while the Dacians whom they have driven out hold the mountains and forests as far as the river Theiss. From the river Maros, or else the Dora if it is that which separates them from the Suebi and the Kingdom of Vannius, the opposite side of the country is occupied by the Basternae and then other German tribes. Agrippa describes the whole of this area from the Danube to the sea as being 1200 miles in length by 396 in breadth, as far as the river Vistula in the direction of the Sarmatian desert. The name of Scythians has spread in every direction, as far as the Sarmatae and the Germans, but this old designation has not continued for any except the most outlying sections of these races, living almost unknown to the rest of mankind.

After the Danube come the towns of Cremniscoi and Aepolium, the Macrocremni Mountains, and the famous river Dniester, which gives its name to the town on the site which previously was called Ophiusa. A large island in the Dniester, inhabited by the Tyragetae, is 130 miles from the False Mouth of the Danube. Then come the Axiacae named from the river Axiaces, and beyond them the Crobyzi, the river Rhode, the Sangarian Gulf, the port of Ordesus, and 120 miles from the Dniester the river Dnieper and the lake and tribe of the same name, and the town 15 miles inland from the sea, the old names of which were Olbiopolis and Miletopolis. Returning to the coast, we come to the Port of the Achaeans and the Isle of Achilles, famous for the tomb of that hero, and 125 miles from it a peninsula stretching out at a slant in the shape of a sword, and called the Racecourse of Achilles from having been his exercising ground; its length is given by Agrippa as 80 miles. The whole of this stretch is occupied by the Scythian Sardi and Siraci. Then there is a wooded region that has given its name to the Forest Sea that washes its coast; the inhabitants are called the tribe of the Indigene. Beyond is the river Somara, which forms the boundary between the Nomad and Agricultural tribes, and then the Acesinus. Some authorities say that below Olbia the Somara flows into the Dnieper, but the more accurate make the Bug a tributary of the Dnieperso erroneous it is to put the latter in a region of Asia.

Here the sea runs in, forming a large gulf, until there is only a space of five miles separating it from the Sea of Azov, and it forms the coastline of vast tracts of land and numerous races; this is called the Gulf of Negropoli. Here is the river Pacyris, the towns of Navarum and Carcine, and behind them Lake Buces, which discharges into the sea by an artificial channel. Lake Buces itself is shut off by a rocky ridge from the Bay of Coretus in the Sea of Azov. Into it run the rivers Buces, Gerrhus and Bug, coming from different directions: for the Gerrhus separates the Nomads and the Basilides, while the Bug flows through the Nomads and Foresters and discharges by an artificially made channel into the Buces and by a natural channel into the Coretus: this region has the name of Scythia Sindica.

At the river Carcinites begins the Crimea, itself also formerly surrounded by the sea where there are now low-lying stretches of land, though afterwards it rises in huge mountain ridges. The population includes 30 tribes; of these 23 live in the interior, 6 towns are occupied by the Orgocyni, Characeni, Assyrani, Stactari, Acisalitae and Caliordi, and the Scythotauri occupy the actual ridge. On the west side they are adjoined by the New Peninsula and on the east by the Satauci Scythians. The towns on the coast after Carcine are Taphrae at the actual neck of the peninsula, and then the Heraclean Peninsula, a place on which Rome has recently bestowed freedom; it was formerly called Megarice, and is the most highly cultured community in all this region owing to its having preserved the manners of Greece; it is encircled by a wall measuring five miles. Then come the Virgin's Cape, Placia a city of the Tauri, the port of Balaklava, Ram's Head Cape, jutting out into the middle of the Black Sea opposite to Cape Kerempi in Asia with a space between them of 170 miles, which is chiefly the reason that produces the shape of a Scythian bow! After this come a number of harbours and lakes belonging to the Tauri. The town of Theodosia is 125 miles from Ram's Head and 165 from the Peninsula. Beyond it there were in former times the towns of Cytae, Zephyrium, Acrae, Nymphaeum and Dia; while by far the strongest of them all, the Milesian city of Kertsch at the actual mouth of the Straits still stands: it is 84 miles from Theodosia and 4 miles as we have said, from the town of Cimmerium situated across the Straits -- this is the width that here separates Asia from Europe, and even this can usually be crossed on foot when the Gulf is frozen over. On the Straits of Kertsch, the length of which is 12 miles, are the towns of Hermisium and Myrmecium, and

inside the Straits is the island of Alopece. The coast of the Sea of Azov, from the place called Taphrae at the end of the isthmus to the mouth of the Straits of Kertsch measures altogether 260 miles.

After Taphrae, the interior of the mainland is occupied by the Auchetai and the Neuroi, in whose territories respectively are the sources of the Bug and the Dnieper, the Geloni, Thyssagetae, Budini, Basilidae and Agathyrsi, the last a darkhaired people; above them are the Nomads and then the Cannibals, and after Lake Buces above the Sea of Azov the Sauromatae and Essedones. Along the coast, as far as the river Don, are the Maeotae from whom the sea receives its name, and last of all in the rear of the Maeotae are the Arimaspi. Then come the Ripaean Mountains and the region called Pterophorus, because of the feather-like snow continually falling there; it is a part of the world that lies under the condemnation of nature and is plunged in dense darkness, and occupied only by the work of frost and the chilly lurkingplaces of the north wind. Behind these mountains and beyond the north wind there dwells (if we can believe it) a happy race of people called the Hyperboreans, who live to extreme old age and are famous for legendary marvels. Here are believed to be the hinges on which the firmament turns and the extreme limits of the revolutions of the stars, with six months' daylight and a single day of the sun in retirement, not as the ignorant have said, from the spring equinox till autumn: for these people the sun rises once in the year, at midsummer, and sets once, at midwinter. It is a genial region, with a delightful climate and exempt from every harmful blast. The homes of the natives are the woods and groves; they worship the gods severally and in congregations; all discord and all sorrow is unknown. Death comes to them only when, owing to satiety of life, after holding a banquet and anointing their old age with luxury, they leap from a certain rock into the sea: this mode of burial is the most blissful. Some authorities have placed these people not in Europe but on the nearest part of the coasts of Asia, because there is a race there with similar customs and a similar location, named the Attaci; others have put them midway between the two suns, the sunsets of the antipodes and our sunrise, but this is quite impossible because of the enormous expanse of sea that comes between. Those who locate them merely in a region having six months of daylight have recorded that they sow in the morning periods, reap at midday, pluck the fruit from the trees at sunset, and retire into caves for the night. Nor is it possible to doubt about this race, as so many authorities state that they regularly send the first fruits of their harvests to Delos as offerings to Apollo, whom they specially worship. These offerings used to be brought by virgins, who for many years were held in veneration and hospitably entertained by the nations on the route, until because of a violation of good faith they instituted the custom of depositing their offerings at the nearest frontiers of the neighbouring people, and these of passing them on to their neighbours, and so till they finally reached Delos. Later this practice itself also passed out of use.

The territories of Sarmatia, Scythia and Taurica, and the whole region from the river Dnieper are stated by Marcus Agrippa to measure 980 miles in length and 716 in breadth; but for my own part I consider that in this part of the world estimates of measurement are uncertain.

But in conformity with the plan set out the remaining features of this gulf must be stated. Its seas we have specified.

13. In the Dardanelles there are no islands that deserve mention belonging to Europe. There are two in the Black Sea, 1 miles from the European coast and 14 miles from the mouth of the straits, the Fanari, called by others the Symplegades, these being the islands about which there is the tradition that they once clashed together: the story is due to the fact that they are separated by so small a gap that by persons entering the Black Sea directly facing them they were seen as two, and then when the line of sight became slightly oblique they gave the appearance of coming together. On this side of the Danube there is one of the islands called Apollonia, 80 miles from the Thracian Bosphorus; from this island Marcus Lucullus brought the statue of Apollo of the Capitol. We have stated the places in the Delta of the Danube. Off the mouth of the Dnieper is the Island of Achilles mentioned above, which also has the Greek names of the White Island and Island of the Blest. Modern investigation shows the position of this island to be 140 miles from the Dnieper, 120 from the Dniester, and 50 from the island of Peuce. It is about 10 miles in circuit. The remaining islands in the Gulf of Carcinites are Cephalonnesus, Spodusa and Macra. Before we leave the Black Sea, we must not omit the opinion held by many persons that all the waters of the Mediterranean are derived from this source, and not from the Straits of Gibraltar; the reason that they give for this view is not an improbable one-viz, that the tide is always flowing out of the Black Sea and never ebbing in the other direction

Next we must leave the Black Sea to describe the outer regions of Europe, and crossing the Ripaean Mountains must coast to the left along the shore of the northern ocean until we reach Cadiz. In this direction a number of islands are reported to exist that have no names, but according to the account of Timaeus there is one named Baunonia, lying off Scythia, at a distance of a day's voyage from the coast, on the beach of which in spring time amber is cast up by the waves. The rest of these coasts are only known in detail by reports of doubtful authority. To the north is the ocean; beyond the river Parapanisus where it washes the coast of Scythia Hecataeus calls it the Amalehian Sea, a name that in the language of the natives means 'frozen': Philemon says that the Cimbrian name for it is Morimarusa (that is, Dead Sea) from the Parapanisus to Cape Rusbeae, and from that point onward the Cronian Sea. Xenophon of Lampsacus reports that three days' sail from the Scythian coast there is an island of enormous size called Balcia; Pytheas gives its name as Basilia. Also some islands called the Oeonae are reported of which the inhabitants live on birds' eggs and oats, and others on which people are born with horses' feet, which gives them their Greek name; there are others called the All-ears Islands in which the natives have very large ears covering the whole of their bodies, which are otherwise left naked.

From this point more definite information begins to open up, beginning with the race of the Inguaeones, the first that we come to in Germany. Here there is an enormous mountain. the Saevo, as big as those of the Ilipaean range, which forms an enormous bay reaching to the Cimbrian promontory; it is named the Codanian Gulf, and is studded with islands. The most famous of these is Scandinavia; its size has not been ascertained, and so far as is known, only part of it is inhabited, its natives being the Hilleviones, who dwell in 500 villages, and call their island a second world. Aeningia is thought to be equally big. Some authorities report that these regions as far as the river Vistula are inhabited by the Sarmati, Venedi, Sciri and Hirri, and that there is a gulf named Cylipenus, with the island of Latris at its mouth, and then another gulf, that of Lagnus, at which is the frontier of the Cimbri. The Cimbrian promontory projects a long way into the sea, forming a peninsula called Tastris. Then there are twenty-three islands known to the armed forces of Rome; the most noteworthy of these are Burcana, called by our people Bean Island from the quantity of wild beans growing there, and the island which by the soldiery is called Glass Island from its amber, but by the barbarians Austeravia, and also Actania.

The whole of the seacoast as far as the German river Scheldt is inhabited by races the extent of whose territories it is impossible to state, so unlimited is the disagreement among the writers who report about them.

The Greek writers and some of our own have given the coast of Germany as measuring 2500 miles, while Agrippa makes the length of Germany including Raetia and Nonicum 686 miles and the breadth 248 miles.

14 whereas the breadth of Raetia alone almost exceeds that figure; though to be sure it was only conquered about the time of Agrippa's deathfor Germany was explored many years after, and that not fully. If one may be allowed to conjecture, the coast will be found to be not much shorter than the Greek idea of it and the length given by Agrippa.

There are five German races: the Vandals, who include the Burgodiones, Varinnae, Charini and Gutones; the second race the Inguaeones, including Cimbri, Teutoni and the tribes of the Chauci; nearest to the Rhine the Istiaeones, including the Sicambri; inland the Hermiones, including the Suebi, Hermunduri, Chatti and Cherusci; and the fifth section the Peucini, and the Basternae who march with the Dacians above mentioned. Notable rivers that flow into the Ocean are the Guthalus, the Visculus or Vistula, the Elbe, the Weser, the Ems, the Rhine and the Meuse. In the interior stretches the Hercinian range of mountains, which is inferior to none in grandeur.

15. In the Rhine itself, the most notable island is that of the Batavi and Cannenefates, which is almost a hundred miles in length, and others are those of the Frisii, Chauci, Frisiavones, Sturii and Marsacii, which lie between Briel and Vlieland. The latter give their names to the mouths into which the Rhine divides, discharging itself on the north into the lakes there and on the west into the river Meuse, while at the middle mouth between these two it keeps a small channel for its own name.

16. Opposite to this region lies the island of Britain, famous in the Greek records and in our own; it lies to the north-west, facing, across a wide channel, Germany, Gaul and Spain, countries which constitute by far the greater part of Europe. It was itself named Albion, while all the islands about which we shall soon briefly speak were called the Britains. Its distance from Gesoriacum on the coast of the Morini tribe by the shortest passage is 50 miles. Its circumference is reported by Pytheas and Isidorus to measure 4875 miles; nearly thirty years ago, its exploration was carried by the armed forces of Rome to a point not beyond the neighbourhood of the Caledonian Forest. Agrippa believes the length of the island to be 800 miles and its breadth 300 and the breadth of Ireland the same but its length 200 miles less. Ireland lies beyond Britain, the shortest crossing being from the district of the Silures, a distance of 30 miles. Of the remaining islands it is said that none has a circumference of more than 125 miles. There are the 40 Orkneys separated by narrow channels from each other, the 7 Shetlands, the 30 Hebrides, and between Ireland and Britain the Islands of Anglesea, Man. Racklin, White-horn, Dalkey and Bardsey; south of Britain are Sian and Ushant, and opposite, scattered about in the direction of the German Sea, are the Glass Islands which the Greeks in more modern times have called the Electrides, from the Greek word for amber, which is produced there. The most remote of all those recorded is Thule, in which as we have pointed out there are no nights at midsummer when the sun is passing through the sign of the Crab, and on the other hand no days at midwinter; indeed some writers think this is the case for periods of six months at a time without a break. The historian Timaeus says there is an island named Mictis lying inward six days' sail from Britain where tin is found, and to which the Britons cross in boats of osier covered with stitched hides. Some writers speak of other islands as well, the Scandiae, Dumna, Bergos, and Berricep the largest of all, from which the crossing to Thule starts. One day's sail from Thule is the frozen ocean, called by some the Cronian Sea.

17. The whole of Gaul included under the general name of Long-haired divides into three races of people, which are chiefly separated by the rivers: from the Scheldt to the Seine is Belgic Gaul, from the Seine to the Garonne Celtic Gaul, also called Lyonese, and from the Garonne to the projection of the Pyrenees Aquitanian Gaul, previously called Armorica. Agrippa reckoned the entire length of the coast at 1750 miles, and the dimensions of the Gauls between the Rhine and the Pyrenees and the ocean and the moutains of the Cevennes and Jura, which exclude the Narbonne division of Gaul, aslength 420 miles, breadth 318 miles.

The part beginning at the Scheldt is inhabited by the Texuandri, who have several names, and then the Menapi, the Morini, the Oromarsaci adjacent to the canton called Chersiacus, the Bretons, the Ambiani, the Bellovaci and the Bassi; and more in the interior the CatoSlugi, Atrebates, Nervi (a free people), Veromandui, Suaeuconi, Suessiones (free), Ulmancetes (free), Tungri, Sunici, Frisiavones, Baetasi, Leuci (free), Treveri (formerly free), Lingones (federated), Remi (federated), Mediomatrici, Sequani, Raurici, Helveti; and the Equestrian and Rauric colonies. The races of Germany living on the banks of the Rhine in the same province are the Nemetes, Triboci and Vangioncs, and among the Ubii the Colony of Agrippina, a the Guberni, the Batavi and the people whom we have already mentioned as dwelling on the islands of the Rhine.

18. To Lyonese Gaul belong the Lexovii, Veliocasses, Galeti, Veneti, Abrincatui, Ossismi, the famous river Loire, and also the still more remarkable that runs out into the ocean from the boundary of the Ossismi and measures 625 miles round and 125 miles across at its neck. Beyond that neck are the Namnetes, and in the interior the Aedui (federated), Carnuteni (federated), Boii, Senones, Aulerci (both those named Eburovices and those named Cenomani), Neldi (free), Parisii, Tricasses, Andicavi, Viducasses, Bodiocasses, Venelli, Coriosvelites, Diablinti, Rhedones, Turones, Atesui, and Secusiani (free), in whose territory is the colony of Lyons.

19. To Aquitanian Gaul belong the Ambilatri, Anagnutes, Pictones, Santoni (free), Bituriges, also named Vivisci (free), Aquitani (who give their name to the province), Sediboviates; then the Convenae together forming one town, the Begerri, the Tarbelli Quattuorsignani, Cocosates Sexsignani, Venami, Onobrisates, Belendi; the Pyrenean pass; and below the Mountain Oscidates, Sybillates, Camponi, Monesi Bercorcates, Pinpedunni, Lassunni, Vellates, Toruates. Consoranni, Ausei, Elusates, Sottiates, Oscidates of the Plain, Succasses, Latusates, Basaboiatcs, Vassei, Sennatcs and the Cambolectri Agessinates. Joining on to the Pictones are the Bitnriges called Cubi (free), then the Lemovices, Arverni (free), Gabales, and again, marching with the province of Gallia Narbonensis, the Ruteni, Cadurci, Nitiobroges, and separated by the river Tarn from the people of Toulouse, the Petrocori.

The seas round the coast are: as far as the Rhine the Northern ocean, between the Rhine and the Seine the British Sea, and between the Seine and the Pyrenees the Gallic Sea. There are a number of islands of the Veneti, both those called the Veneticae and Oleron in the Gulf of Aquitania.

20. At the promontory of the Pyrenees begins Spain, which is narrower not only than Gaul but even than itself, as we have said, seeing how enormously it is pressed together on one side by the ocean and on the other by the Iberian Sea. The actual chain of the Pyrenees, spreading from due east to southwest, makes the Spanish provinces shorter on the northern side than on the southern. On the nearest coast is situated Hither or Tarragonian Spain; along the sea-coast from the Pyrenees are the forest of the Vascones, Olarso, the towns of the Varduli, Morogi, Menosca, Vesperies and the port of Amanum, the present site of the colony of Flaviobrica; then the district of the nine states of the Cantabri the river Sauga, the port of Victory of the Juliobricenses (from this place the sources of the Ebro are 40 miles distant), the port of Blendium, the Orgenomesci (a branch of the Cantabrians), their port Vereasueca, the district of the Astures, the town of Noega, the Pesici on a peninsula; and then, belonging to the jurisdiction of Lugo, starting from the river Navialbio, the Cibarci, the Egivarri surnamed Namarini, Jadovi. Arroni. Arrotrebae; the Celtic Promontory, the rivers Florius and Nelo, the Celts surnamed Neri, and above them the Tamarci, on whose peninsula are the three Altars of Sestius dedicated to Augustus, the Copori, the town of Noeta, the Celts surnamed Praestamarci, the Cileni, Of the islands must be specified Corticata and Aunios. After the Cileni, in the jurisdiction of the Bracae are the Helleni, the Grovi and Tyde Castle, all people of Greek stock; the Dry Islands, the town of Abobrica, the river Minho four miles wide at its mouth, the Leuni, the Seurbi, Augusta, a town belonging to the Bracae, above whom is Gallaecia; the Limia stream and the river Douro, one of the largest in Spain, which rises in the district of the Pelendones and passing by Numantia then flows through the Arevaci and Vaccaei, separating the Vettones from Asturia and the Gallaeci from Lusitania, and at this point also separating the Turduli from the Bracari. The whole of the district mentioned, from the Pyrenees onward, is full of mines of gold, silver, iron, lead and tin.

21. From the Douro begins Lusitania: the old Turduli, the Paesuri, the river Vouga, the town of Talabrica, the town and river Agueda, the towns of Coimbra, Leiria and Eboro di Alcobaza. Then there runs out into the sea a promontory shaped like a vast horn, called by some people Artabrum, by others the Great Cape, and by many Cape Lisbon after the town; this headland sharply divides the land and sea and climate. This cape ends the side of Spain, and after rounding it the front of Spain begins.

22. On one side of it is the north and the Gallic Ocean, and on the other the west and the Atlantic. The distance to which this promontory projects has been given as 60 miles, and by others as 90 miles; the distance from here to the Pyrenees many give as 1250 miles, and place here a race of Artabres, which never existed, the error being obvious; they have put here, with an alteration in the spelling of the name, the Arrotrebae, whom we spoke of before we came to the Celtic Promontory.

Mistakes have also been made in regard to the important rivers. From the Minho, which we spoke of above, the distance to the Agueda according to Varro is 200 miles, though others place the latter elsewhere and call it the Liniaea; in early times it was called the River of Forgetfulness, and a great many stories were told about it. Two hundred miles from the Douro is the Tagus, the Mondego coming between them; the Tagus is famous for its auriferous sands. At a distance of nearly 160 miles from the Tagus is Cape St. Vincent, projecting from nearly the middle of the front of Spain. The distance from Cape St. Vincent to the middle of the Pyrenees is stated by Varro to amount to 1400 miles; from St. Vincent to the Guadiana, which we Indicated as the boundary between Lusitania and Baetica, he puts at 126 miles, the distance from the Guadiana to Cadiz adding another 102 miles

The peoples are the Celtici, the Turduli, and on the Tagus the Vettones; and between the Guadiana and Cape St. Vincent the Lusitanians. The notable towns on the coast, beginning at the Tagus, are: Lisbon, famous for its mares which conceive from the west wind; Alcazar do Sal, called the Imperial City; Santiago de Cacem; Cape St. Vincent, and the other promontory called the Wedge; and the towns of Estombar, Tavira and Mertola.

The whole province is divided into three associations, centred at Merida, Beja and Santarem. It consists of 45 peoples in all, among whom there are five colonies, one municipality of Roman citizens, three with the old Latin rights and 36 that pay tribute. The colonies are Merida on the river Guadiana, Medellin, Beja, and Alcantara surnamed Caesarina (to this Trucillo and Caceres are assigned); and the fifth is that of Santarem, which is called the Garrison of Julius. The municipality of Roman citizens is Lisbon, surnamed the Success of Julius. The towns with the old Latin rights are Evora, which is also called the Generosity of Julius, and Mertola and Alcazar do Sal which we have mentioned. Of the tributary towns that deserve mention, besides those already specified in the list of names of those belonging to Baetica, are Axabrica, Balsa, Augustobriga, Aemia, Arandita, Caesarobrica, Capera, Coria, Colarna, Cibilita, Concordia, Elbocorium, Interamnimn, Lancia, Malabriga surnamed Celtic, Medubriga surnamed Plumbaria, Ocelum, the Turduli also called Bardili, and the Tapori.

The dimensions of Lusitania combined with Astnria and Gallaecia are given by Agrippa as: length 540 miles, breadth 536 miles. The provinces of Spain taken all together, measured from the two promontories of the Pyrenees along the sea line, are estimated to cover by the circumference of the whole coast 2924 miles, or by others 2600 miles.

Opposite to Celtiberia are a number of islands called by the Greeks the Tin Islands in consequence of their abundance of that metal; and facing Cape Finisterre are the six Islands of the Gods, which some people have designated the Isles of Bliss. But immediately at the beginning of Baetica comes Cadiz, 25 miles from the mouth of the Strait, an island according to Polybius's account measuring 12 miles in length and 3 miles in breadth. Its distance from the mainland at the nearest point is less than 233 yards, but at other places it is more than 7 miles; the circuit of the island is 15 miles. It has a town whose population have the Roman citizenship and are called Augustans, the title of their city being Julia Gaditana. On the side facing Spain at a distance of about 100 yards is another island one mile long and one mile broad, on which the town of Cadiz was previously situated; Ephorus and Philistus call it Aphrodisias, but its native name is the Isle call this island Erythea, and Timaeus and Silenus of Juno. The larger island according to Timaeus is known as Potimusa from its wells, but our people call it Tartesos and the Punic name is Gadir, which is Carthaginian for a fence; it was called Erythea, because the original ancestors of the Carthaginians, the Tyrians, were said to have come from the Red Sea. This island is believed by some people to have been the home of the Geryones whose cattle were carried off by Hercules; but others hold that that was another island, lying off Lusitania, and that an island there was once called by the same name.

23. Having completed the circuit of Europe we must now give its complete dimensions, in order that those who desire this information may not be left at a loss. Its length from the Don to Cadiz is given by Artemidorus and Isidorus as 7714 miles. Polybius stated the breadth of Europe from Italy to the ocean as 1150 miles, but its exact magnitude had not been ascertained even in his day. The length of Italy itself up to the Alps is 1020 miles, as we stated; and from the Alps through Lyons to the in harbour of the Morini, the port on the British channel, the line of measurement that Polybius appears to take, is 1169 miles, but a better ascertained measurement and a longer one is that starting also from the Alps but going north-west through the Camp of the Legions in Germany to the mouth of the Rhine 1243 miles.

Next after this we shall speak of Africa and Asia.

NATURAL HISTORY BOOK 5

1. The Greeks give to Africa the name of Libya, and they call the sea lying in front of it the Libyan Sea. It is bounded by Egypt. No other part of the earth has fewer bays or inlets in its coast, which stretches in a long slanting line from the west. The names of its peoples and towns are absolutely unpronounceable except by the natives; and for the rest, they mostly reside in fortresses.

The list of its countries begins with the two called Mauretania, which down to the time of the emperor Caligula were kingdoms, but by his cruelty were divided into two provinces. The outermost promontory projecting into the ocean is named by the Greeks Ampelusia. Beyond the Straits of Gibraltar there were once the towns of Lissa and Cotte: but at the present day there is only Tangier, which was originally founded by Antaeus and subsequently entitled Traducta Julia by the emperor Claudius when he established a colony there. It is 30 miles distant from the town of Baelon in Baetica, where the passage across is shortest. On the Atlantic coast 25 miles from Tangier is Julia Constantia Zulil, a colony of Augustus, which is exempt from the government of the native kings and included under the jurisdiction of Baetica. Thirtyfive miles from Zulil is Lixus, made a colony by the emperor Claudius, about which the most marvellous legends are told by the old writers: this was the site of the palace of Antaeus and the scene of his combat with Hercules, and here were the gardens of the Ladies of the West. As a matter of fact an arm of the sea stretches inland here with a winding channel which, as people nowadays explain the story, had some resemblance to a guardian serpent; it embraces within it an island which, although the neighbouring district is considerably elevated, is nevertheless the only portion not flooded by the tides. On the island there also rises an altar of Hercules, but of the famous grove in the story that bore the golden fruit nothing else except some wild olive trees. No doubt less wonder may be felt at the portentous falsehoods of Greece put about concerning these serpents and the river Lixus by people who reflect that our own countrymen, and these quite recently, have reported little less miraculous stories about the same matters, stating that this city is exceedingly powerful and greater than Great Carthage ever was, and moreover that it is situated in a line with Carthage and at an almost immeasurable distance from Tangier, and all the other details swallowed so greedily by Cornelius Nepos.

In the interior, 40 miles from Lixus, is another colony of Augustus, Babba, called Julia. On The Plains, and 75 miles further, a third, Banasa, which has the surname of Valentia. Thirty-five miles from Banasa is the town of Volubile, which is at the same distance from the coasts of the Atlantic and the Mediterranean. On the shore, 50 miles from Lixus, is the river Sebou, flowing by the colony of Banasa, a fine river available for navigation. The same number of miles from the Sebou is the town of Sallee, situated on the river of the same name; this town is on the very edge of the desert, and is beset by herds of elephants, but much more seriously harried by the Autololes tribe, through whose territory lies the road to Mount Atlas, which is the subject of much the most marvellous stories of all the mountains in Africa. It is reported to rise into the sky out of the middle of the sands, a rugged eminence covered with crags on the side facing towards the coast of the Ocean to which it has given its name, but shaded by dense woods and watered by gushing springs on the side facing Africa, where fruits of all kinds spring up of their own accord with such luxuriance that pleasure never lacks satisfaction. It is said that in the daytime none of its inhabitants are seen, and that all is silent with a terrifying silence like that of the desert, so that a speechless awe creeps into the hearts of those who approach it, and also a dread of the peak that soars above the clouds and reaches the neighbourhood of the moon's orb; also that at night this peak flashes with frequent fires and swarms with the wanton gambols of Goat-Pans and Satyrs, and echoes with the music of flutes and pipes and the sound of drums and cymbals. These stories have been published by celebrated authors, in addition to the labours performed in this region by Hercules and Perseus. It is an immense distance away, across unexplored country.

There were also once extant some notes of the Carthaginian commander Hanno, who at the most flourishing period of the Punic state was ordered to explore the circuit of Africa. It is Hanno whom the majority of the Greek and Roman writers have followed in the accounts that they have published of a number of cities founded by him there of which no memory or trace exists, not to speak of other fabulous stories.

Scipio Aemilianus, during his command in Africa, placed a fleet of vessels at the service of the historian Polybius for the purpose of making a voyage of discovery in that part of the world. After sailing round the coast, Polybius reported that beyond Mount Atlas in a westerly direction there are forests teeming with the wild animals that Africa engenders. Agrippa says that to the river Anatis is a distance of 496 miles, and from the Anatis to Linus 205 miles; that Linus is 112 miles from the Straits of Gibraltar and that then come the gulf called Sagigi Bay, the town on Cape Mulelacha, the rivers Sebou and Sallee, the port of Mazagan 224 miles from Linus. then Capo Blanco, the port of Safi, the Gaetulian Free State, the river Tensift, the Velatiti and Masati tribes, the river Mogador, and the river Sous, in which crocodiles are found Then, he states, a gulf 616 miles across is enclosed by the promontory of the Atlas chain projecting westward, called Cape Ger. After this the river Assa, beyond which is the Aethiopiau tribe of the Perorsi, and in their rear the Pharusii, Adjoining these in the interior are the Gaetulian Darae, and on the coast the Aethiopian Daratitae and the river Non, which is full of crocodiles and hippopotamuses. From the Non runs a line of mountains extending right to the peak of which the Greek name is, as we shall state, the Chariot of the Gods The distance from this peak to Cape Roxo he gives as a voyage of ten days and nights; and in the middle of this space he places Mount Atlas, which all other authorities give as situated at the farthest point of Mauretania.

The first occasion on which the armed forces of Rome fought in Mauretania was in the principate of Claudius, when King Ptolemy had been put to death by Caligula and his freedman Aedemon was seeking to avenge him; and it is an accepted fact that our troops went as far as Mount Atlas in pursuit of the routed natives. And not only were the exconsuls and generals drawn from the senate who commanded in that campaign able to boast of having penetrated the Atlas range, but this distinction was also shared by the Knights of Rome who subsequently governed the country. The province contains, as we have said, five Roman colonies, and, to judge by common report, the place might well be thought to be easily accessible; but upon trial this criterion is discovered to be for the most part exceedingly fallacious, because persons of high position, although not inclined to search for the truth, are ashamed of ignorance and consequently are not reluctant to tell falsehoods, as credulity is never more easily let down than when a false statement is attested by an authority of weight. For my own part I am less surprised that some things are outside the knowledge of gentlemen of the equestrian order, some of whom indeed nowadays actually get into the senate, than that anything should be unknown to luxury, which acts as an extremely great and powerful stimulus, inasmuch as forests are ransacked for ivory and citrus-wood and all the rocks of Gaetulia explored for the murex and for purple. The natives, however, inform us that on the coast 150 miles from the Sallee is the River Asana, which is a tidal river but which is notable for its harbour; and then the river which they call the Fat, and 200 miles from it, after crossing a river named Ivor, the Diris rangethat is agreed to be the native name for the Atlas: and that in the neighbourhood are traces of the land having formerly been inhabitedremains of vineyards and palm-groves.

Suetonius Paulinus, who was consul in our own times, was the first Roman commander who actually crossed the Atlas range and advanced a distance of many miles beyond it. His report as to its remarkable altitude agrees with that of all the other authorities, but he also states that the regions at the base of the range are filled with dense and lofty forests of trees of an unknown kind, with very tall trunks remarkable for their glossy timber free from knots, and foliage like that of the cypress except for its oppressive scent, the leaves being covered with a thin downy floss, so that with the aid of art a dress-material like that obtained from the silk-worm can be made from them. The summit (the report continued) is covered with deep snowdrifts even in summer. Ten days' march brought him to this point and beyond it to the river called the Ger, across deserts covered with black dust occasionally broken by projections of rock that looked as if they had been burnt, a region rendered uninhabitable by its heat, although it was winter time when he explored it. He states that the neighbouring forests swarm with every kind of elephant and snake, and are inhabited by a tribe called the Canarii, owing to the fact that they have their diet in common with the canine race and share with it the flesh of wild animals.

It is well ascertained that the next people are the Aethiopian tribe called the Perorsi. Juba, the father of Ptolemy, who was the first ruler to hold sway over both the Mauretanias, and who is even more distinguished for his renown as a student than for his royal sovereignty, has published similar facts about Mount Atlas, and has stated in addition that a plant grows there called the euphorbia, named after his doctor who discovered it; in a volume devoted solely to the subject of this plant he sings the praises of its milky juice in very remarkable terms, stating it to be an aid to clear sight and an antidote against snakebite and poisons of all kinds. This is enough, or more than enough, about Mount Atlas.

The province of Tangier is 170 miles in length. It contains the following tribes: the Moors (from whom it takes its name of Mauretania), by many writers called the Maurusii, were formerly the leading race, but they have been thinned by wars and are now reduced to a few families. The next race to this was previously that of the. Masaesyli, but this has been wiped out in a similar manner. The country is now occupied by the Gaetulian tribes, the Baniurae and the Free State, by far the most powerful of them all, and the Nesimi, who were formerly a section of the Autoteles, but have split off from them and formed a separate tribe of their own in the direction of the Aethiopians. The province itself produces elephants in its mountainous district on the eastern side and also on Mount Ceuta and the range of peaks called the Seven Brothers from their similarity of height; these mountains join on to Mount Ceuta and overlook the Straits of Gibraltar. At the Seven Brothers begins the coast of the Mediterranean, and next come the navigable river Bedia and the site of a former town of the same name, the river Gomera, also navigable for vessels, the town and harbour of Safi, and the navigable river Maluia. Opposite to Malaga in Spain is situated the town of Aresgol, the capital of King Syphax, where we reach the second Mauretania for these regions for a long time took the names of their kings. Further Mauretania being called the Land of Bogut and similarly the present Caesariensis the Land of Bocchus. After Aresgol come the port called from its size Great Harbour, a town with Roman citizenship; the river Mulucha, the frontier between the Land of Bocchus and the Masaesyli; Quiza Xenitana ('Alienville'); Arzen, a town with Latin rights, three miles from the sea; Tenez, a colony of Augustus, where the Second Legion was settled, and Gunugu, likewise a colony of the same emperor and the settlement of a praetorian cohort; Cape Mestagan, and on it the famous town of Caasarea previously called Jol, the capital of King Juba, to which colonial rights were granted by his late Majesty Claudius; New Town, founded as a settlement of veteran troops, and Tipasa, granted Latin rights by the same emperor's orders, and also Icosium given the same privilege by the emperor Vespasian; Rusguniae, a colony of Augustus, Rusucurium, given the honour of citizenship by Claudius, Rusazus, a colony of Augustus, Saldae, a colony of the same, Igilgili likewise; the town of Zucca, situated on the sea and the river Ampsaga. In the interior is the colony of Augusta, also called Sucehabar, and likewise Tubusuptu, the independent cities of Timici and Tigavae, the rivers Sardaval, Ayes and Nabar, the Macurebi tribe, the river Usar, and the Nababes tribe. From the river Ampsaga to Caesarea is 322 miles. The length of the two Mauretanias is 1038 miles and the breadth 467 miles.

2. At the river Ampsaga begins Numidia, a country rendered famous by the name of Masinissa. The Greeks called it Metagonitis, and they named its people the Nomads, from their custom of frequently changing their pasturage, carrying their maptdia, that is their homes, about the country on waggons. The towns are Chollum and Sgigada, and in the interior about 48 miles from the latter the colony of Cirta, called Cirta of the Sitianii and another colony further inland, Sicca, and the free town of King's Bulla. On the coast are Tagodet, King's Hippo, the river Mafragg, and the town of Tabraca, which has Roman citizenship. The boundary of Numidia is the river Zaina. The country produces nothing remarkable beside the Numidian marble and wild beasts.

3. Beyond the Zaina is the district of Zeugitana and the region properly to be called Africa. Three promontories run out into the sea, White Cape and then Cape Farina facing Sardinia and Cape Bon facing Sicily; these form two baysthe Bay of Hippo next the town called Hippo Dirutus, in Greek Diarrhytus, which name is due to its irrigation channels, and adjacent to this, further from the coast, Theudalis, a town exempt from tribute; and then Cape Farina, and on the second

bay Utica, which has the rights of Roman citizenship; it is famous as the scene of the death of Cato. Then there is the river Merjerdah, the place called the Camp of Cornelius, the colony of Carthage on the site of Great Carthage, the colony of Maxula, the towns of Carpi, Misua and Clypea, the last a free town on Cape Mercury, where are also the free towns Kurbah and Nabal.

Then comes another section of Africa proper. The inhabitants of Byzacium are called Libyphoenicians, Byzacium being the name given to a region measuring 250 miles round, a district of exceptional fertility, the soil paying the farmers interest at the rate of a hundredfold. Here are the free towns of Lempta, Sousa, Monastir, Demas, and then Taineh, Ayes, Mahometa, Cabs and Sabart on the edge of the Lesser Syrtis; from the Ampsaga to this point the length of Numidia and Africa is 580 miles and the breadth so far as ascertained 200 miles. The part that we have called Africa is divided into two provinces, the Old and the New; the division between these, as agreed between the younger Scipio and the Kings, is a dyker running right through to the town of Taineh, which is 216 miles from Carthage.

rendered formidable by the shallow tidal waters of the two Syrtes. The distance between the nearest Syrtis, which is the smaller of the two, and Carthage is said by Polybius to be 300 miles; and he gives its width across as 100 miles and its circuit as 300 miles. There is however also a way to it by land, that can be found by observation of the stars, across a desert abandoned to the sand and swarming with serpents. Next come forests filled with a multitude of wild beasts, and further inland desolate haunts of elephants, and then a vast desert, and beyond it the Garamantes tribe, at a distance of twelve days' journey from Aujelah. Beyond these was formerly the Psylli tribe, and beyond them Lake Lynxama, surrounded by desert. Aulelah itself is situated almost in the middle, at an equal distance on either side from the Ethiopia that stretches westward and from the region lying between the two Syrtes. But by the coast between the two Syrtes it is 250 miles; here are the independent city of Oea, the river Cinyps and the district of that name, the towns of Neapolis, Taphra, Habrotonum and the second Leptis, called Great Leptis. Then comes the Greater Syrtis, measuring 625 miles round and 312 wide at the entrance, near which dwells the race of the Cisippades. At the end of this Gulf was once the Coast of the Lotus-eaters, the people called by some the Machroae, extending to the Altars of the Philaenithese are formed of heaps of sand. After these, not far from the shore of the mainland, there is a vast swamp into which flows the river Tritonis, the name of which it bears: Callimachus calls it the Lake of Pallas. He places it on the nearer side of the Lesser Syrtis, but many writers put it between the two Syrtes. The promontory shutting in the Greater. Syrtis is called Cape Trajuni; beyond it is the province of Cyrene.

Between the river Ampsaga and this boundary Africa contains 516 peoples that accept allegiance to Rome. These include six colonies, Uthina and Thuburbi, in addition to those already mentioned; 15 towns with Roman citizenship, among which in the interior must be mentioned those of Absurae.

Abutucum, Aborium, Canopicum, Chimavis, Simittuum, Thunusidum, Thuburnicum, Thinidrumum, Tibiga, the two towns called Ucita, the Greater and the Lesser, and Vaga; one town with Latin rights, Uzalita; one tributary town at the Camp of Cornelius; 30 free towns, of which must be mentioned in the interior the towns of Acholhta, Accarita, Avina, Abzirita, Canopita, Mehzita, Matera, Salaphita, Tusdrita, Tiphica, Tunisa, Theuda, Tagesa, Tiga, Ulusubrita, a second Vaga, Viga and Zama. Of the remaining number most can rightly be entitled not merely cities but also tribes, for instance the Natabudes, Capsitani, Musulami, Sabarbares, Massyli, Nicives, Vamacures, Cinithi, Musuni, Marchubi, and the whole of Gaetulia as far as the river Quorra, which separates Africa from Ethiopia.

5. Notable places in the district of Cyrenaica (the Greek name of which is the Land of the Five Cities) are the Oracle of Ammon, which is 400 miles from the city of Cyrene, the Fountain of the Sun, and especially five cities, Benghazi, Arsinoe, Tolmeita, Marsa Sousah and Cyrene itself. Benghazi is situated at the tip of the horn of the Syrtis; it was formerly called the City of the Ladies of the West, mentioned above, as the myths of Greece is often change their locality; and in front of the town not far away is the river Leton, with a sacred grove, reputed to be the site of the gardens of the Ladies of the West. Benghazi is 375 miles from Leptis; and Arsinoe is 43 miles from Benghazi, commonly called Teuchira, and then 22 miles further Ptolemais, the old name of which was Barce; then 40 miles on the cape of Ras Sem projects into the Cretan Sea, 350 miles distant from Cape Matapan in Laconia and 225 miles from Crete itself. After the cape of Ras Sem is Cyrene, 11 miles from the sea, from Ras Sem to the harbour of Cyrene being 24 miles and to Ras El Tin 88 miles, from which it is 216 miles to the Canyon. The inhabitants of this coast are the Marmaridae, reaching almost all the way from the region of El Bareton to the Greater Syrtis; after these are the Acrauceles and then on the edge of the Syrtis the Nasamones, formerly called by the Greeks Mesammones by reason of their locality, the word meaning in the middle of the sands'. The territory of Cyrene for a breadth of 15 miles from the coast is thought to be good even for growing trees, but for the same space further inland to grow only corn, and afterwards over a strip 30 miles wide and 250 miles long nothing but silphium.

After the Nasamones, we come to the dwellings of the Asbytae and Macae: and beyond them, twelve days' journey from the Greater Syrtis, the Amantes. These also are surrounded by sands in the western direction, but nevertheless they find water without difficulty at a depth of about three feet, as the district receives the overflow of the waters of Mauretania. They build their houses of blocks of salt quarried out of their mountains like stone. From these it is a journey of 7 days in a south-westerly quarter to the Cave-dwellers, with whom our only intercourse is the trade in the precious stone imported from Ethiopia which we call the carbuncle. Before reaching them, in the direction of the African desert stated already to be beyond the Lesser Syrtis, is Fezzan, where we have subjugated the Fezzan tribe and the cities of Mellulen and Zala, as well as Gadamez in the direction of Sabrata. After these a long range stretches from east to west which our people from its nature call the Black Mountain, as it has the appearance of having suffered from fire, or else of being scorched by the reflection of the sun. Beyond this mountain range is the desert, and then a town of the Garamantes called Thelgae, and also Bedir (near which there is a spring of which the water is boiling hot from midday to midnight and then freezing cold for the same number of hours until midday) and Garama, the celebrated capital of the Garamantes: all of which places have been subdued by the arms of Rome, being conquered by Cornelius Balbus, who was given a triumphthe only foreigner ever so honouredand citizen rights, since, although a native of Cadiz, he together with his great-uncle, Balbus, was presented with our citizenship. There is also this remarkable circumstance, that our writers have handed down the names of the towns mentioned above as having been taken by him, and have stated that in his own triumphal procession beside Cydamum and Garama were carried the names and images of all the other races and cities, which went in this order: the town of Tibesti, the Niteris tribe, the town of Milgis Gemella, the tribe or town of Febabo, the tribe of the Enipi, the town of Thuben, the mountain known as the Black Mountain, the towns called Nitibrum and Rapsa, the Im-Zera tribe, the town of Om-El-Abid, the river Tessava, the town of Sava, the Tamiagi tribe, the town of Boin, the town of Winega, the river Dasibari: then a series of towns, Baracum, Buluba, Alasit, Oalsa, Balla, Missolat, Cizania: and Mount Goriano, its effigy preceded by an inscription that it was a place where precious stones were produced.

Hitherto it has been impossible to open up the road to the Garamantes country, because brigands of that race fill up the wells with sandthese do not need to be dug very deep if you are aided by a knowledge of the localities. In the last war waged with the people of Oea, at the beginning of the principate of Vespasian, a short route of only four days was discovered, which is known as By the Head of the Rock. The last place in Cyrenaica is called the Canyon, a town and a suddenly descending valley. The length of Cyrenaic Africa from the Lesser Syrtis to this boundary is 1060 miles, and the breadth, so far as ascertained, 810 miles.

6. The district that follows is called Libya Mareotis; it borders upon Egypt. It is occupied by the Marmarides, the Adyrmachidae, and then the Mareotae. The distance between the Canyon and Paraetonium is 86 miles. Between them in the interior of this district is Apis, a place famous in the Egyptian religion. The distance from Apis to Paraetonium is 62 miles, and from Paraetonium to Alexandria 200 miles. The district is 169 miles in breadth. Eratosthenes gives the distance by land from Cyrenae to Alexandria as 525 miles. Agrippa made the length of the whole of Africa from the Atlantic, including Lower Egypt, 300 miles; Polybius and Eratosthenes, who are deemed extremely careful writers, made the distance from the Ocean to Great Carthage 1100 miles, and from Great Carthage to the nearest mouth of the Nile, Canopus, 1628 miles; Isidorus makes the distance from Tangier to Canopus 3599 miles, but Artemidorus makes it 40 miles less than Isidorus.

7. These seas do not contain very many islands. The most famous is Zerba, 25 miles long and 22 miles broad, called by Eratosthenes Lotus Eaters' Island. It has two towns, Meninx on the side of Africa and Thoar on the other side, the island itself lying off the promontory on the right-hand side of the Lesser Syrtis, at a distance of a mile and a half away. A hundred miles from Zerba and lying off the left-hand promontory is the island of Cercina, with the free city of the arcross where it is 25 miles long and measures half that distance across where it is widest, but not more than 5 miles across at its end; and joined to it by a bridge is the extremely small island of Cercinitis, which looks towards Carthage. About 50 miles from these is Lopadusa, 6 miles long; then come Gaulos and Galata, the soil of the latter having the property of killing scorpions, that pest of Africa. It is also said that scorpions cannot live at Clupea, opposite to which lies Pantellaria with its town. Opposite the Gulf of Carthage lie the two Aegimoeroi; but the Altars, which are more truly rocks than islands, are chiefly between Sicily and Sardinia. Some authorities state that even the Altars were formerly inhabited but that their level has sunk.

8. In the interior circuit of Africa towards the south and beyond the Gaetulians, after an inter-mediate strip of desert, the first inhabitants of all are the Egyptian Libyans, and then the people called in Greek the White Ethiopians. Beyond these are the Ethiopian clans of the Nigritae, named after the river which has been mentioned, the Pharusian Gymnetes, and then bordering on the Ocean the Perorsi whom we have spoken of at the frontier of Mauretania. Eastward of all of these there are vast uninhabited regions spreading as far as the Garamantes and Augilae and the Cave-dwellersthe most reliable opinion being that of those who place two Ethiopias beyond the African desert, and especially Homer, who tells us that the Ethiopians are divided into two sections, the eastward and the westward.

The river Niger has the same nature as the Nile: it produces reeds and papyrus, and the same animals, and it rises at the same seasons of the year. Its source is between the Ethiopic tribes of the Tarraelii and the Oechalicae; the town of the latter is Magium. In the middle of the desert some place the Atlas tribe, and next to them the half-animal Goat-Pans and the Blemmyae and Gamphasantes and Satyrs and Strapfoots.

The Atlas tribe have fallen below the level of human civilization, if we can believe what is said: for they do not address one another by any names, and when they behold the rising and setting sun, they utter awful curses against it as the cause of disaster to themselves and their fields, and when they are asleep they do not have dreams like the rest of mankind. The Cave-dwellers hollow out caverns, which are their dwellings: they live on the flesh of snakes, and they have no voice, but only make squeaking noises, being entirely devoid of intercourse by speech. The Garamantes do not practise marriage but live with their women promiscuously. The Augilae only worship the powers of the lower world. The Gamphasantes go naked, do not engage in battle, and hold no intercourse with any foreigner. The Blemmyae are reported to have no heads, their mouth and eves being attached to their chests. The Satyrs have nothing of ordinary humanity about them except human shape. The form of the Goat-Pans is that which is commonly shown in pictures of them. The Strapfoots are people with feet like leather thongs, whose nature it is to crawl instead of walking. The Pharusi, originally a Persian people are said to have accompanied Hercules on his journey to the Ladies of the West. Nothing more occurs to us to record about Africa.

9. Joining on to Africa is Asia, the extent of which from the Canopic mouth of the Nile to the mouth of the Black Sea is given by Timosthenes as 2638 miles; Eratosthenes gives the distance from the mouth of the Black Sea to the mouth of the Sea of Azov as 1545 miles; and Artemidorus and Isidorus give the whole extent of Asia including Egypt as far as the river Don as 5013 miles. It possesses several seas, named after the tribes on their shores, for which reason they will be mentioned together.

The inhabited country next to Africa is Egypt, which stretches southward into the interior to where the Ethiopians border it in the rear. The boundaries of its lower part are formed by the two branches of the Nile embracing it on the right and on the left, the Canopic mouth separating it from Africa and the Pelusiac from Asia, with a space of 170 miles between the two mouths. This has caused some authorities to class Egypt as an island, because the Nile divides in such a manner as to produce a piece of land shaped like a triangle; and consequently many have called Egypt by the name of the Greek letter Delta. The distance from the point where the single channel first splits into branches to the Canopic mouth is 146 miles.

The uppermost part of Egypt, marching with Ethiopia, is called the Thebaid. It is divided into prefectures of towns, called 'nomes'the Ombite, Apollonopolite, Hermonthite, Thinite, Phaturite, Coptite, Tentyrite, Diospolite, Antaeopolite, Aphroditopolite and Lycopolite nomes. The nomes belonging to the district in the neighbourhood of Pelusium are the Pharbaethite, Bubastite, Sethroite and Tanite. The remaining nomes are called the Arabic, Hammoniac (on the way to the oracle of Jupiter Ammon), Oxvrhynchite, Leontopolite. Athribite. Cynopolite. Xoite, Mendesian, Sebennyte, Cabasite, Hermopolite, Latopolite, Heliopolite, Vrosopite, Panopolite, Busirite, Onuphite, Saite, Ptenethus, Ptemphus, Naucratite, Metellite, Gynaecopolite, Menelaitethese forming the region of Alexandria; and likewise Mareotis belonging to Libya. The Heracleopolite nome is on an island of the Nile measuring 50 miles long, on which is also the town called the City of Hercules. There are two nomes called the Arsinoite; these and the Memphite extend to the apex of the Delta, adjacent to which on the side of Africa are the two Oasite nomes. Certain authorities alter some out of these names and substitute other nomes, for instance the Heropolite and Crocodilopolite.

Copyright © 2018 by Lord Henfield, Guildford Scientific Press PAGE 3446 Between the Arsinoite and Memphite nomes there was once a lake measuring 250, or according to Mucianus's account 450, miles round, and 250 feet deep, an artificial sheet of water, called the Lake of Moeris after the king who made it. Its site is 62 miles from Memphis, the former citadel of the kings of Egypt, and from Memphis it is 12 days' journey to the Oracle of Ammon and 15 days' journey to the place where the Nile divides and forms what we have called the Delta.

10. The sources from which the Nile rises have not been ascertained, proceeding as it does through scorching deserts for an enormously long distance and only having been explored by unarmed investigators, without the wars that have discovered all other countries; but so far as King Juba was able to ascertain, it has its origin in a mountain of lower Mauretania not far from the Ocean, and immediately forms a stagnant lake called Nilldes. Fish found in this lake are the alabeta, coracinus and silurus; also a crocodile was brought from it by Juba to prove his theory, and placed as a votive offering in the temple of Isis at Caesarea, where it is on view today. Moreover it has been observed that the Nile rises in proportion to excessive falls of snow or rain in Mauretania. Issuing from this lake the river disdains to flow through arid deserts of sand, and for a distance of several days' journey it hides underground but afterwards it bursts out in another larger lake in the territory of the Masaesyles clan of Mauretania Caesariensis, and so to speak makes a survey of the communities of mankind, proving its identity by having the same fauna. Sinking again into the sand of the desert it hides for another space of 20 days' journey till it reaches the nearest Ethiopians, and when it has once more become aware of man's proximity it leaps out in a fountain, probably the one called the Black Spring. From this point it forms the boundary line between Africa and Ethiopia, and though the riverside is not immediately inhabited, it teems with wild beasts and animal life and produces forests; and where the river cuts through the middle of Ethiopia it has the name of Astapus, which in the native language means water issuing from the shades below. It strews about such a countless number of islands, and some of them of such vast size, that in spite of its very rapid flow it nevertheless only flies past them in a course of five days, and not shorter; while making the circuit of the most famous of these islands. Meroe, the lefthand channel is called Astobores, that is 'branch of water coming out of the shades,' and the right-hand channel Astusapes, which means 'side branch.' It is not called Nile until its waters are again reconciled and have united in a single stream, and even then for some miles it still has the name of Girls which it had previously. Its name in Homer is Aegyptus over its whole course, and with other writers it is the Triton. Every now and then it impinges on islands, which are so many incitements spurring it forward on its way, till finally it is shut in by mountains, its flow being nowhere more rapid; and it is borne on with hurrying waters to the place in Ethiopia called in Greek the Downcrash, where at its last cataract, owing to the enormous noise it seems not to run but to riot between the rocks that bar its way. Afterwards it is gentle, the violence of its waters having been broken and subdued, and also it is somewhat fatigued by the distance it has raced, and it belches out, by many mouths it is true, into the Egyptian Sea. For a certain part of the year however its volume greatly increases and it roams abroad over the whole of Egypt and inundates the land with a fertilising flood.

Various explanations of this rising of the river have been given; but the most probable are either the backwash caused by what are called in Greek the Annual Winds, which blow in the opposite direction to the current at that period of the year, the sea outside being driven into the mouths of the river, or the summer rains of Ethiopia which are due to the same Annual Winds bringing clouds from the rest of the world to Egypt. The mathematician Timaeus produced a very recondite theorythat the source of the Nile is a spring called Phiala, and that the river buries itself in burrows underground and breathes forth vapour owing to the steaming hot rocks among which it hides itself; but that as the sun at the period in question comes nearer the river water is drawn out by the force of the heat and rises up and overflows, and withdraws itself to avoid being swallowed up. This, he says, begins to occur at the rising of the Dog-star, when the sun is entering the sign of the Lion, the sun standing in a vertical line above the spring, at which season in that region shadows entirely disappearthough the general opinion on the contrary is that the flow of the Nile is more copious when the sun is departing towards the north, which happens when it is in the Crab and the Lion, and that consequently the river is dried up less then; and again when the sun returns to Capricorn and towards the south pole its waters are absorbed and its volume consequently reduced. But if anybody is inclined to accept the possibility of Timaeus's explanation that the waters of the river are drawn out of the earth there is the fact that in these regions absence of shadows goes on continuously at this season. The Nile begins to rise at the next new moon after midsummer, the rise being gradual and moderate while the sun is passing through the Crab and at its greatest height when it is in the Lion; and when in Virgo it begins to fall by

the same degrees as it rose. It subsides entirely within its banks, according to the account given by Herodotus, on the hundredth day, when the sun is in the Scales. The view has been held that it is unlawful for kings or rulers to sail on the Nile when it is rising. Its degrees of increase are detected by means of wells marked with a scale. An average rise is one of 24 feet. A smaller volume of water does not irrigate all localities, and a larger one by retiring too slowly retards agriculture; and the latter uses up the time for sowing because of the moisture of the soil, while the former gives no time for sowing because the soil is parched. The province takes careful note of both extremes: in a rise of 18 feet it senses famine, and even at one of 194 feet it begins to feel hungry, but 21 feet brings cheerfulness, 224 feet complete confidence and 24 feet delight. The largest rise up to date was one of 27 feet in the principate of Claudius, and the smallest 74 feet in the year of the war of Pharsalus, as if the river were attempting to avert the murder of Pompey by a sort of portent. When the rise comes to a standstill, the floodgates are opened and irrigation begins; and each strip of land is sown as the flood relinquishes it. It may be added that the Nile is the only river that emits no exhalations.

It first comes within the territory of Egypt at the Ethiopian frontier, at Assuanthat is the name of the peninsula a mile in circuit in which, on the Arabian side, the Camp is situated and off which lie the four islands of Philae, 600 miles from the place where the Nile splits into two channelsthe point at which, as we have said, the island called the Delta begins. This is the distance given by Artemidorus, who also states that the island formerly contained 250 towns; Juba, however, gives the distance as 400 miles. Aristocreon says that the distance from Elephantis to the sea is 750 milesElephantis is an inhabited island 4 miles below the last cataract and 16 above Assuan; it is the extreme limit of navigation in Egypt, being 585 miles from Alexandriaso far out in their calculations have the above-named authors been. Elephantis is the point of rendezvous for Ethiopian vessels, which are made collapsible for the purpose of portage on reaching the cataracts.

11. In addition to boasting its other glories of the cities past Egypt can claim the distinction of having had Egypt in the reign of King Amasis 20,000 cities; and even now it contains a very large number, although of no importance. However, the City of Apollo is notable, as is also the City of Leucothea and the Great City of Zeus, also called Thebes, renowned for the fame of its hundred gates, Coptos the market near the Nile for Indian and Arabian merchandise, and also the Town of Venus and the Town of Jove and Tentvris, below which is Abydos, famous for the palace of Memnon and the temple of Osiris, in the interior of Libva 7 miles from the river. Then Ptolemais and Panopolis and another Town of Venus, and on the Libyan side Lycon, where the Province of Thebes is bounded by a mountain range. Beyond this are the Towns of Mercury, and of the Alabastri, the Town of Dogs, and the Town of Hercules mentioned above. Then Arsinoe's Town and Memphis already mentioned, between which and the Arsinoite district on the Libyan side are the towers called pyramids, and on Lake Moeris the Labyrinth, in the construction of which no timber was used with the masonry, and the town of the Criali. There is one place besides in the interior and bordering on the Arabian frontier which is of great renown; Heliopolis.

But justice requires that praise shall be bestowed on Alexandria, built by Alexander the Great on the coast of the Egyptian Sea on the side of Africa, 12 miles from the Canopic mouth and adjoining Lake Mariout; The site was previously named Rhacotes. It was laid out by the architect Dinochares, who is famous for his talent in a variety of ways: it covered an area spreading 15 miles in the shape of a Macedonian soldier's cape, with indentations in its circumference and projecting corners on the right and left side; while at the same time a fifth of the site was devoted to the King's palace. Lake Mariout, which lies on the south side of the city, carries traffic from the interior by means of a canal from the Canopic mouth of the Nile; also it includes a considerable number of islands. being 30 miles across and 250 miles in circumference, according to Claudius Caesar. Others make it 40 schoeni [4 or 5 miles] long and reckon 150 miles, and they give the same figure for the breadth.

There are also many considerable towns in the region of the lower parts of the Nile, especially those that have given their names to the mouths of the flyer, thongh not all of these are named after townsfor we find that there are twelve of them, besides four more that the natives call 'false mouths'but the seven best known are the Canopic mouth nearest to Alexandria and then the Bolbitine, Sebennytic, Phatnitic, Mendesic, Tanitic, and last the Pelusiac.

Besides the towns that give their names to the mouths there are Butos, Pharbaethos, Leontopolis, Athribis, the Town of Isis, Busiris, Cynopolis, Aphrodite's Town, Sais, and Naucratis, after which some people give the name of Naucratitic to the mouth called by others the Heracleotic, and mention it instead of the Canopic mouth which is next to it.

12. Beyond the Pelusiac mouth of the Nile is Arabia, extending to the Red Sea and to the Arabia known by the

surname of Happy and famous for its perfumes and its wealth. This bears the names of the Cattabanes, Esbonitae and Scenitae tribes of Arabs; its soil is barren except where it adjoins the frontier of Syria, and its only remarkable feature is the El Kas mountain. The Arabian tribe of the Canchlei adjoin those mentioned on the east and that of the Cedrei on the south, and both of these in their turn adjoin the Nabataei. The two gulfs of the Red Sea where it converges on Egypt are called the Gulf of Suez and the Gulf of Akaba; between the two towns of Akaba and Guzzah, which is on the Mediterranean, there is a space of 150 miles. Agrippa says that the distance from Pelusium across the desert to the town of Ardscherud on the Red Sea is 125 miles: so small a distance in that region separates two such different regions of the world!

13. The next country on the coast is Syria, formerly the greatest of lands. It had a great many divisions with different names, the part adjacent to Arabia being formerly called Palestine, and Judaea, and Hollow Syria, then Phoenicia and the more inland part Damascena, and that still further south Babylonia as well as Mesopotamia between the Euphrates and the Tigris, the district beyond Mount Taurus Sophene, that on this side of Sophene Commagene, that beyond Armenia Adiabene, which was previously called Assyria, and the part touching Cilicia Antiochia. Its length between Cilicia and Arabia is 470 miles and its breadth from Seleukeh Pieria to Bridgetown on the Euphrates 175 miles. Those who divide the country into smaller parts hold the view that Phoenicia is surrounded by Syria, and that the order is the seacoast of Syria of which Idumaea and Judaca are a part, then Phoenicia, then Syria. The whole of the sea lying off the coast is called the Phoenician Sea. The Phoenician race itself has the great distinction of having invented the alphabet and the sciences of astronomy, navigation and strategy.

14. After Pelusium come the Camp of Chabrias, Mount El Kas the temple of Jupiter Casius, and the tomb of Pompey the Great. At Ras Straki, 65 miles from Pelusium, is the frontier of Arabia. Then begins Idumaea, and Palestine at the point where the Serbonian Lake comes into view. This lake is recorded by some writers as having measured 150 miles roundHerodotus gave it as reaching the foot of Mount El Kas; but it is now an inconsiderable fen. There are the towns of El-Arish and inland Refah, Gaza and inland Anthedon, and Mount Argaris. Further along the coast is the region of Samaria, the free town Ascalon, Ashdod, the two towns named Iamnea, one of them inland; and the Phoenician city of Joppa. This is said to have existed before the flood; it is situated on a hill and in front of it is a rock on which they point out marks made by the chains with which Andromeda was fettered; here there is a cult of the legendary goddess Ceto. Next Apollonia, and the Tower of Strato, otherwise Caesarea, founded by King Herod, but now the colony called Prima Flavia established by the Emperor Vespasian; this is the frontier of Palestine, 189 miles from the confines of Arabia. After this comes Phoenicia and inland Samaria: the towns are Naplous, formerly called Mamortha, Sebustieh on a mountain, and on a loftier mountain Gamala.

15. Beyond Idumaea and Samaria stretches the wide expanse of Judaea. The part of Judaea adjoining Syria is called Galilee, and that next to Arabia and Egypt Peraea. Peraea is covered with rugged mountains, and is separated from the other parts of Judaea by the river Jordan. The rest of Judaea is divided into ten Local Government Areas in the following order: the district of Jericho, which has numerous palm-groves and springs of water, and those of Emmaus, Lydda, Joppa, Accrabim, Juffia, Timnath-Serah, Bethlebaoth, the Hills, the district that formerly contained Jerusalem, by far the most famous city of the East and not of Judaea only, and Herodium with the celebrated town of the same name.

The source of the river Jordan is the spring of Panias from which Caesarea described later takes its second name. It is a delightful stream, winding about so far as the conformation of the locality allows, and putting itself at the service of the people who dwell on its banks, as though moving with reluctance towards that gloomy lake, the Dead Sea, which ultimately swallows it up, its much-praised waters mingling with the pestilential waters of the lake and being lost. For this reason at the first opportunity afforded by the formation of the valleys it widens out into a lake usually called the Sea of Gennesareth. This is 16 miles long and 6 broad, and is skirted by the pleasant towns of Bethsaida and Hippo on the east, El Kereh on the south (the name of which place some people also give to the lake), and Tabariah with its salubrious hot springs on the west. The only product of the Dead Sea is bitumen, the Greek word for which gives it its Greek name. Asphaltites. The bodies of animals do not sink in its waters, even bulls and camels floating; this has given rise to the report that nothing at all can sink in it. It is more than 100 miles long, and fully 75 miles broad at the broadest part but only 6 miles at the narrowest. On the east it is faced by Arabia of the Nomads, and on the south by Machaerus, at one time next to Jerusalem the most important fortress in Judaea. On the same side there is a hot spring possessing medicinal value, the name of which, Callirrho, itself proclaims the celebrity of its waters.

On the west side of the Dead Sea, but out of range of the noxious exhalations of the coast, is the solitary tribe of the Essenes, which is remarkable beyond all the other tribes in the whole world, as it has no women and has renounced all sexual desire, has no money, and has only palm-trees for company. Day by day the throng of refugees is recruited to an equal number by numerous accessions of persons tired of life and driven thither by the waves of fortune to adopt their manners. Thus through thousands of ages (incredible to relate) a race in which no one is born lives on for ever: so prolific for their advantage is other men's weariness of life!

Lying below the Essenes was formerly the town of Engedi, second only to Jerusalem in the fertility of its land and in its groves of palm-trees, but now like Jerusalem a heap of ashes. Next comes Masada, a fortress on a rock, itself also not far from the Dead Sea. This is the limit of Judaea.

16. Adjoining Judaea on the side of Syria is the region of Decapolis, so called from the number of its towns, though not all writers keep to the same towns in the list; most however include Damascus, with its fertile water-meadows that drain the river Chrysorrho, Philadelphia, Raphana (all these three withdrawn towards Arabia), Scythopolis (formerly Nysa, after Father Liber's nurse, whom he buried there) where a colony of Scythians are settled; Gadara, past which flows the river Yarmak; Hippo mentioned already, Dion, Pella rich with its waters, Galasa, Canatha. Between and around these cities run tetrarchies, each of them equal to a kingdom, and they are incorporated into kingdomsTrachonitis, Panias (in which is Caesarea with the spring mentioned above), Abila, Area, Ampeloessa and Gabe.

17. From this point we must go back to the coast and to Phoenicia. There was formerly a town called Crocodilon, and there is still a river of that name; and the cities of Dora and Sycamini, of which only the memory exists. Then comes Cape Carmel, and on a mountain the town of the same name. formerly called Acbatana. Next are Getta, Geba, and the river Pacida or Belus, which covers its narrow bank with sand of a kind used for making glass; the river itself flows out of the marsh of Cendebia at the foot of Mount Carmel. Close to this river is Ptolemais, a colony of the Emperor Claudius, formerly called Acce: and then the town of Ach-Zib, and the White Cape. Next Tyre, once an island separated from the mainland by a very deep sea-channel 700 yards wide, but now joined to it by the works constructed by Alexander when besieging the place, and formerly famous as the mother-city from which sprang the cities of Leptis, Utica and the great rival of Rome's empire in coveting world-sovereignty, Carthage, and also Cadiz, which she founded outside the confines of the world; but the entire renown of Tyre now consists in a shell-fish and a purple dye! The circumference of the city, including Old Tyre on the coast, measures 19 miles, the actual town covering 2 miles. Next are Zarephath and Bird-town, and the mother-city of Thebes in Boeotia, Sidon, where glass is made.

Behind Sidon begins Mount Lebanon, a chain extending as far as Zimyra in the district called Hollow Syria, a distance of nearly 190 miles. Facing Lebanon, with a valley between, stretches the equally long range of Counter-Lebanon, which was formerly connected with Lebanon by a wall. Behind Counter-Lebanon inland is the region of the Ten Cities, and with it the tetrarchies already mentioned, and the whole of the wide expanse of Palestine; while on the coast, below Mount Lebanon, are the river Magoras, the colony of Beyrout called Julia Felix, Lion's Town, the river Lycus, Palaebyblos, the river Adonis, the towns of Jebeil, Batrun, Gazis, Trieris, Calamos; Tarablis, inhabited by people from Tyre, Sidon and Ruad: Ortosa, the river Eleutheros, the towns of Zimvra and Marathos; and facing them the seven-furlong town and island of Ruad, 330 yards from the mainland: the region in which the mountain ranges above mentioned terminate: and beyond some intervening plains Mount Bargylus.

18. At this point Phoenicia ends and Syria begins again. There are the towns of Tartus, Banias, Bolde and Djebeleh; the cape on which the free town of Latakia is situated; and Dipolis, Heraclea, Charadrus and Posidium. Then the cape of Antiochian Syria, and inland the city of Antioch itself, which is a free town and is called 'Antioch Near Daphne,' and which is separated from Daphne by the river Orontes; while on the is the free town of Seleukeh, called Pieria. Above cape Seleukeh is a mountain having the same name as the other one, Casius, which is so extremely lofty that in the fourth quarter of the night it commands a view of the sun rising through the darkness, so presenting to the observer if he merely turns round a view of day and night simultaneously. The winding route to the summit measures 19 miles, the perpendicular height of the mountain being 4 miles. On the coast is the river Orontes, which rises between Lebanon and Counter-Lebanon, near Baalbec. The towns are Rhosos, and behind it the pass called the Gates Mount Taurus and on the coast the town of of Syria, in between the Rhosos Mountains and Myriandros, and Mount Alma-Dagh, on which is the town of Bomitae. This mountain separates Cilicia from Svria.

19. Now let us speak of the places inland. Hollow Syria contains the town of Kulat el Mudik, separated by the river

Marsyas from the tetrarchy of the Nosairis; Bambyx, which is also named the Holy City, but which the Syrians call Maboghere the monstrous goddess Atargatis, the Greek name for whom is Derceto, is worshipped; the place called Chalcis on Belus, which gives its name to the region of Chalcidene, a most fertile part of Syria; and then, belonging to Cyrrestica, Cyrrus and the Gazetae, Gindareni and Gabeni; the two tetrarchies called Granucomatitae: the Hemeseni, the Hylatae, the Ituraei tribe and a branch of them called the Baethaemi: the Mariamnitani; the tetrarchy called Mammisea; Paradise, Pagrae, Penelenitae; two places called Seleucia in addition to the place of that name already mentioned, Seleucia on the Euphrates and Seleucia on Belus; and the Tardytenses. The remainder of Syria (excepting the parts that will be spoken of with the Euphrates) contains the Arbethusii, the Berocenses, the Epiphanenses on the Orontes, the Laodiceans on Lebanon, the Leucadii and the Larisaei, besides seventeen tetrarchies divided into kingdoms and bearing barbarian names.

20. A description of the Euphrates also will come most suitably at this place. It rises in Caranitis, prefecture of Greater Armenia, as has been stated by two of the persons who have seen it nearest to its sourceDomitius Corbulo putting its source in Mount Aga and Licinius Mucianus at the roots of a mountain the name of which he gives as Capotes, twelve miles above Zimara. Near its source the river is called Pyxurates. Its course divides first the Derzene region of Armenia and then the Anaetic from Cappadocia. Dascusa is 75 miles from Zimara; and from Dascusa the river is navigable to Sartona, a distance of 50 miles, to Mehtene in Cappadocia 24 miles, and to Elegea in Armenia 10 miles, receiving the tributary streams Lycus, Arsania and Arsanus. At Elegea it encounters Mount Taurus, which however does not bar its passage although forming an extremely powerful barrier 12 miles broad. The river is called the Omma where it forces its way into the range, and later, where it emerges, the Euphrates; beyond the range also it is full of rocks and has a violent current. From this point it forms the frontier between the district of Arabia called the country of the Orroei on the left and Commagene on the right, its breadth being three cables' length, although even where it forces its passage through the Taurus range it permits of a bridge. At Claudiopolis in Cappadocia it directs its course towards the west; and there for the first time in this combat Mount Taurus carries the stream out of its course, and though conquered and cleft in twain gains the victory in another manner by breaking its career and forcing it to take a southerly direction. Thus this duel of nature becomes a drawn battle, the river reaching the goal of its choice but the mountain preventing it from reaching it by the course of its choice. After passing the Cataracts the stream is again navigable; and 40 miles from this point is Samosata the capital of Commagene.

21. Arabia above mentioned contains the towns Edessa. which was formerly called Antiochia, Callirrhoe, named from its spring, and Carrhae, famous for the defeat of Crassus there. Adjoining it is the prefecture of Mesopotamia, which derives its origin from the Assyrians and in which are the towns of Anthemusia and Nicephorium. Then comes the Arab tribe called the Praetavi, whose capital is Singara. Below Samosata, on the Syrian side, the river Marsyas flows into the Euphrates. At Cingilla the territory of Commagene ends and state of the Imenei begins. The towns washed by the river are Epiphania and Antioch (called Antioch on the Euphrates), and also Bridgetown, 72 miles from Samosata, famous as a place where the Euphrates can be crossed, Apamea on the opposite bank being joined to it by a bridge constructed by Seleucus, the founder of both towns. The people contiguous to Mesopotamia are called the Rhoali. In Syria are the town of Europus and the town formerly called Thapsacus and now Amphipolis, and an Arab tribe of Scenitae. So the river flows on to the place named Sara, where it takes a turn to the east and leaves the Syrian desert of Palmyra which stretches right on to the city of Petra and the region called Arabia Felix.

Palmyra is a city famous for its situation, for the richness of its soil and for its agreeable springs; its fields are surrounded on every side by a vast circuit of sand, and it is as it were isolated by Nature from the world, having a destiny of its own between the two mighty empires of Rome and Parthia, and at the first moment of a quarrel between them always attracting the attention of both sides. It is 337 miles distant from Parthian Seleucia, generally known as Seleucia on the Tigris, 203 miles from the nearest part of the Syrian coast, and 27 miles less from Damascus.

Below the Desert of Palmyra is the district of Stelendena, and Holy City, Beroea and Chalcis already mentioned. Beyond Palmyra also a part of this desert is claimed by Hemesa, and a part by Elatium, which is half as far as Damascus is from Petrae. Quite near to Sura is the Parthian town of Philiscum on the Euphrates; from Philiscum to Seleucia is a voyage of ten days, and about the same to Babylon. At a paint 594 miles from Bridgetown, the Euphrates divides round the village of Massice, the left branch passing through Seleucia itself into Mesopotamia and falling into the Tigris as it flows round that city, while the righthand channel makes for Babylon, the former capital of Chaldea, and passing through the middle of it, and also through the city called Mothris, spreads out into marshes. Like the Nile, the Euphrates also increases in volume at fixed periods with little variation, and floods Mesopotamia when the sun has reached the 20th degree of the Crab; but when the sun has passed through the Lion and entered Virgo it begins to sink, and when the sun is in the 29th degree of Virgo it returns to its channel entirely.

22. But let us return to the coast of Syria, adjoining which is Cilicia. Here are the river Diaphanes, Mount Crocodile, the Gates of Mount Alma-Dagh, the rivers Androcus, Pinarus and Lycus, the Gulf of Issos, the town of Issos, likewise Alexandria, the river Chlorus, the free town of Aegaeae, the river Pyramus, the Gates of Cilicia, the towns of Mallos and Magirsos and in the interior Tarsus, the Aleian Plains, the towns of Casyponis, Mopsos (a free town on the river Pyramus), Tyros, Zephyrium and Anchfale; and the rivers Saros and Cydnos, the latter cutting through the free city of Tarsus at a great distance from the sea; the district of Celenderitis with its town, the place Nymphaeum, Soloi of Cilicia now Pompeiopolis, Adana, Cibyra, Pinare, Pedalie, Ale, Selinus, Arsinoe, Iotape, Dorion, and on the coast Corycos, there being a town and harbour and cave of the same name. Then the river Calycadnus, Cape Sarpedon, the towns of Holmoe and Myle, and the promontory and town of Venus, a short distance from which lies the island of Cyprus. On the mainland are the towns of Mysanda, Anemurium and Coracesium and the river Melas, the former boundary of Cilicia. Places worthy of mention in the interior are Anazarbeni (the present Caesarea), Augusta, Castabala, Epiphania (previously called Oeniandos), Eleusa, Iconium, and beyond the river Calycadnus Selencia, called Seleucia Tracheotis, a city moved from the seashore, where it used to be called Hermia. Besides these there are in the interior the rivers Liparis, Bombos and Paradisus, and Mount Imbarus,

23. All the authorities have made Pamphylia join on to Cilicia, overlooking the people of Isauria. The inland towns of Isauria are Isaura, Clibanus and Lalasis; it runs down to the sea over against Anemurium above mentioned. Similarly all who have written on the same subject have ignored the tribe of the Omanades bordering on Isauria, whose town of Omana is in the interior. There are 44 other fortresses lying hidden among rugged valleys.

24. The crest of the mountains is occupied by the Pisidians, formerly called the Solymi, to whom belong the colony of Caesarea also named Antioch and the towns of Oroanda and Sagalessos.

25. The Pisidians are bordered by Lycaonia, included in the jurisdiction of the province of Asia, which is also the centre for the peoples of Philomelium Tymbrium, Leucolithium, Pelta and Tyriacum. To that jurisdiction is also assigned a tetrarchy that forms part of Lycaonia in the division adjoining Galatia, consisting of 14 states, the most famous city being leonium. Notable places belonging to Lycaonia itself are Thebasa on Mount Taurus and Ida on the frontier between Galatia and Cappadocia. At the side of Lycaonia, descent, their town is Aryeanda.

26 Pamphylia was previously called Mopsopia. The Pamphylian Sea joins on to the Sea of Cilicia. Pamphylia includes the towns of Side and, on the mountain, Aspendus, Plantanistns and Perga, Cape Leueolla and Mount Sardemisus; its rivers are the Eurymedon flowing past Aspendus and the Catarrhactes on which are Lyrnessus and Oibia and Phaselis, the last place on the coast.

27. Adjoining Pamphylia are the Sea of Lycia and the Lycian tribe, at the point where Mount Taurus coming from the Eastern shores forms the Chelidonian Promontory as a boundary between yast bays. It is itself an immense range, and holds the balance between a countless number of tribes; its right-hand side, where it first rises out of the Indian Ocean, faces north, and its left-hand side faces south; it also stretches westward, and would divide Asia in two at the middle, were it not that in dominating the land it encounters the opposition of seas. It therefore recoils in a northerly direction, and forming a curve starts on an immense route. Nature as it were designedly throwing seas in its way at intervals, here the Phoenician Sea, here the Black Sea, there the Caspian and the Hyrcanian, and opposite to them the Sea of Azov. Consequently owing to their impact the mountain twists about between these obstacles, and nevertheless sinuously emerging victorious reaches the kindred ranges of the Ripaean Mountains. The range is designated by a number of names, receiving new ones at each point in its advance: its first portion is called Imaus, then Emodus, Paropanisus, Circius, Cambades, Pariades, Choatras, Oreges, Oroandes, Niphates, Taurus, and where it overtops even itself, Caucasus, while where it occasionally throws out arms as if trying to invade the sea, it becomes Sarpedon, Coracesius, Cragus, and once again Taurus; and even where it gapes open and makes a passage for mankind, nevertheless claiming for itself an unbroken continuity by giving to these passes the name of Gates: in one place they are called the Armenian Gates, in another the Caspian, and in another the Cilician. Moreover

when it has been cut short in its career, retiring also from the sea, it fills itself on tither side with the names of numerous races, on the right-hand side being called the Hyrcanian Mountain and the Caspian, and on the left the Parihedrian, Moschian, Amazonian, Coraxian, Scythian; whereas in Greek it is called throughout the whole of its course the Ceraunian Mountain.

28. In Lycia therefore after leaving the promontory of Mount Taurus we have the town of Simena, Mount Chimaera, which sends forth flames at night, and the city-state of Hephaestium, which also has a mountain range that is often on fire. The town of Olympus stood here, and there are now the mountain villages of Gagae, Corydalla and Rhodiopolis, and near the sea Limyra with the river of which the Arycandus is a tributary, and Mount Masicitus, the city-state of Andria, Myra, the towns of Aperiae and Antiphellos formerly called Habesos, and in a corner Phellos. Then comes Pyrrha, and also Xanthus 15 miles from the sea, and the river of the same name; and then Patara, previously Pataros, and Sidyma on its mountain, and Cape Cragus. Beyond Cape Cragus is a bay as large as the one before; here are Pinara and Telmessus, the frontier town of Lycia. Lycia formerly contained 70 towns, but now it has 36; of these the most famous besides those mentioned above are Canas, Candyba the site of the famous grove of Eunia, Podalia, Choma past which flows the Aedesa, Cyaneae, Ascandiandalis, Amelas, Noscopium, Tlos, Telandrus. It includes also in its interior Cabalia, with its three cities, Oenianda, Balbura and Bubon, After Telmessus begins the Asiatic or Carpathian Sea, and Asia properly so called. Agrippa divided this country into two parts. One of these he enclosed on the east by Phrygia and Lyeaonia, on the west by the Aegean Sea, on the south by the Egyptian Sea, and on the north by Paphlagonia; the length of this part he made 470 miles and the breadth 320 miles. The other half he bounded on the east by Lesser Armenia, on the west by Phrygia, Lycaonia and Pamphylia, on the north by the Province of Pontus and on the south by the Pamphylian Sea, making it 575 miles long and 325 miles broad.

29. On the adjoining coast is Caria and then Ionia and beyond it Aeolis. Caria entirely surrounds Doris, encircling it right down to the sea on both sides. In Caria are Cape Pedalium and the river Glaucus, with its tributary the Telmedius, the towns of Daedala and Crya, the latter a settlement of refugees, the river Axon, and the town of Calynda. The river Indus, rising in the mountains of the Cibyratae, receives as tributaries 60 streams that are constantly flowing and more than 100 mountain torrents. There is the free town of Caunos and then Pyrnos Port Cressa, from which the island of Rhodes is 20 miles distant, the place Loryma, the towns of Tisanusa, Paridon and Larymna, Thymnias Bay, Cape Aphrodisias, the town of Hydas, Schoenus Bay, and the district of Bubassus; there was formerly a town Acanthus, otherwise named Dulopolis. On a promontory stand the free city of Cnidus, Triopia, and then Pegusa, also called Stadia. After Pegusa begins Doris.

But before we go on it may be as well to describe the back parts of Caria and the jurisdictions of the interior. One of these is called Cibyratica; the actual town of Cibyra belongs to Phrygia, and is the centre for 25 city-states, the most famous being the city of Laodicea. Laodicea is on the river Lycus, its sides being washed by the Asopus and the Caprus; its original name was the City of Zeus, and it was afterwards called Rhoas. The rest of the peoples belonging to the same jurisdiction whom it may not be amiss to mention are the Hydrelitae, Themisones and Hierapolitae. Another centre has received its name from Synnas; it is the centre for the Lycaones, Appiani, Corpeni, Dorvlaei, Midaei, Julienses and 15 other peoples of no note. A third jurisdiction centres at Apamea, previously called Celaenae, and then Cybotos; Apamea is situated at the foot of Mount Signia, with the rivers Marsyas, Obrima and Orba, tributaries of the Maeander, flowing round it; the Marsyas here emerges from underground, and buries itself again a little later. Aulocrene is the place where Marsyas had a contest in flute-playing with Apollo: it is the name given to a gorge 10 miles from Apamea, on the way to Phrygia. Out of this jurisdiction it would be proper to name the Metropolitae, Dionysopohtae, Euphorbeni, Acmonenses, Pelteni and Silbiani; and there are nine remaining tribes of no note.

On the Gulf of Doris are Leucopolis, Hamaxitos, Eleus, Etene; then there are the Carian towns of Pitaium, Eutane and Halicarnassus. To the jurisdiction of Halicarnassus six towns were assigned by Alexander the Great, Theangela, Side, Medmassa, Uranium, Pedasum and Telmisum; the last is situated between two bays, those of Ceramus and Iasus. Next we come to Myndus and the former site of Old Myndus, Nariandos, Neapolis, Caryanda, the free town Termera, Bargylia and Iasus, the town that gives its name to the bay. Caria is especially distinguished for the famous list of places in its interior, for here are Mylasa, a free town, and Antiochia which occupies the sites of the former towns, of Symmaethus and Cranaos; it is now surrounded by the rivers Maeander and Orsinus. This region formerly also contained Maeandropolis; in it are Eumema on the river Cludrus, the river Glaueus, the town of Lysias, and Orthosia, the district of Berecynthus, Nysa, and Trails also called Euanthia and Seleucia and Antiochia. It is washed by the river Eudon and the Thebais flows through it; some record that a race of Pygmies formerly lived in it. There are also Thydonos, Pyrrha, Eurome, Heraclea, Amyzon, the free town of Alabanda which has given its name to this jurisdiction, the free town of Stratonicea, Hynidos, Ceramus, Troezene and Phorontis. At a greater distance but resorting to the same centre for jurisdiction are the Orthronienses, Alidienses, Euhippini, Xystiani, Apolloniatae, Hydissenses, Trapezopolitae and Aphrodisienses, a free people. Besides these places there are Coscinus and Harpasa, the latter on the river Harpasus, which also passes the site of the former town of Trallicon

30. Lydia, bathed by the ever-returning sinuosities of the river Maeander, extends above Ionia; it is bordered by Phrygia to the east and Mysia to the north, and with its southern portion it embraces Caria. It was previously called Maeonria. It is specially famous for the city of Sardis, situated on the vine-clad side of Mount Tmolus, the former name of which was Timolus From Tmolus flows the Pactolus also called the Chrysorrhoas, and the source of the Tarnus; and the city-state of Sardis itself, which is famous for the Gygaean Lake, used to be called Hyde by the people of Maeonia. This jurisdiction is now called the district of Sardis, and besides the people before-named it is the centre for the Macedonian Cadieni, the Philadelphini, and the Maeonii themselves who are situated on the river Cogamus at the foot of Mount Tmolus, the Tripolltani, also called Antoniopolitaetheir territory is washed by the river Maeanderthe Apollonihieritae, the Mysotimolitae and other people of no note.

31. At the Gulf of Iasus Ionia begins. It has a winding coast, with a rather large number of bays. The first is the Royal Bay, then the cape and town of Posideum, and the shrine once called the oracle of the Branchidae, now that of Didymaean Apollo, 4 miles from the coast; and 24 miles from it. Miletus, the capital of Ionia, which formerly bore the names of Lelegeis and Pityusa and Anactoria, the mother of over 90 cities scattered over all the seas; nor must she be robbed of her claim to Cadmus as her citizen, the author who originated composition in prose. From the mountain lake of Aulocrene rises the river Maeander, which washes a large number of cities and is replenished by frequent tributaries; its windings are so tortuous that it is often believed to turn and flow backwards. It first wanders through the region of Apamea, afterwards that of Eumenia, and then the plains of Hyrgale, and finally the country of Caria, its tranquil waters irrigating all these regions with mud of a most fertilising quality; and it glides gently into the sea a mile and a quarter from Miletus. Next comes Mount Latmus, the towns of Heraclea belonging to the mountain so designated in the Carian dialect, Myus which is recorded to have been first founded by Ionian emigrants from Athens, Naulochum, and Priene. At the part of the coast called Troglea is the river Gessus. The district is sacred with all Ionians, and is consequently called Panionia. Next there was formerly a town founded by refugeesas its name Phygela indicatesand another called Marathesium. Above these places is Magnesia, distinguished by the name of Magnesia on Maeander, an offshoot from Magnesia in Thessaly; it is 15 miles from Ephesus, and 3 miles more from Tralles. It previously had the names of Thessaloche and Androlitia. Being situated on the coast it has appropriated the Derasides islands from the sea. Inland also is Thyatira, washed by the Lycus; once it was called Pelopian or Euhippian Thyatira.

On the coast again is Matium, and Ephesus built by the Amazons, previously designated by many namesthat of Alope at the time of the Trojan War, later Ortygia and Amorge; it was also called Smyrna Trachia and Haemonion and Ptelea. It is built on the slope of Mount Pion, and is watered by the Cayster, which rises in the Cilbian range and brings down the waters of many streams, and also drains the Pegasaean Marsh, an overflow of the river Phyrites. From these comes a quantity of mud which advances the coastline and has now joined The island of Syrie on to the mainland by the flats interposed. In the city of Ephesus is the spring called Callippia, and a temple of Diana surrounded by two streams, both called Selinus, coming from different directions.

After leaving Ephesus there is another Matium, which belongs to Colophon, and Colophon itself lying more inland, on the river Halesus. Then the temple of Clarian Apollo, Lebedosformerly there was also the town of NotiumCape Cyrenaeum, and Mount Mimas which projects 150 miles into the sea and slopes down into the plains adjoining. It was here that Alexander the Great had given orders for a canal 7 miles long to be cut across the level ground in question so as to join the two bays and to make an island of Erythrae with Mimas. Near Erythrae were formerly the towns of Pteleon. Hulos and Dorion and there is now the river Aleon Corvnaeum the promontory of Mimas, Clazomenae, and Parthenie and Hippi, which were called the Chytrophoria when they were islands; these Alexander also ordered to be joined to the mainland by a causeway a quarter of a mile in length. Places in the interior that exist no longer were Daphnus and Hermesta and Sipylum

previously called Tantalis, the capital of Maeonia, situated where there is now the marsh named Sale; Archaeopolis which replaced Sipylus has also perished, and later Colpe which replaced Archaeopolis and Libade which replaced Colpe.

On returning thence to the coast, at a distance of 12 miles we come to Smyrna, founded by an Amazon and restored by Alexander; it is refreshed by the river Meles which rises not far off. The mast famous mountains of Asia mostly lie in this district: Mastusia behind Smyrna and Termes, joining on to the roots of Olympus, ends, and is followed by Mount Draco, Draco by Tmolus, Tmolus by Cadmus, and that range by Taurus. After Smyrna the river Hermus forms level plains to which it gives its name. It rises at the Phrygian city-state of Dorylaus, and has many tributary rivers, among them the Phrvx which forms the frontier between the race to which it gives its name and Caria, and the Hyllus and the Gryos, themselves also augmented by the rivers of Phrygia, Mysia and Lydia. At the mouth of the Hennus there was once the town of Temnos, and now at the end of the bay are the rocks called the Ants, the town of Leucae on a headland that was formerly an island and Phocaea the frontier town of Ionia The jurisdiction of Smyrna is also the centre resorted to by a large part of Aeolia which will now be described, and also by the Macedonians called Hyrcani and the Magnesians from Sipylus. But Ephesus, the other great luminary of Asia, is the centre for the Caesarienses, Metropolitae, Upper and Lower Cilbiani, Mysomacedones, Mastaurenses Briullitae Hypaepeni and Dioshieritae.

32. Next is Aeolis, once called Mysia, and Troas lying on the coast of the Dardanelles. Here after passing Phocaea we come to Port Ascanius, and then to the place where once stood Larisa and where now are Cyme, Myrina which styles itself Sebastopolis, and inland Aegaeae, Itale, Posidea, New Wall, Temnos. On the coast are the river Titanus and the citystate named after it, and also once there was Grynia, now only a harbour, formerly an island that had been joined to the mainland; the town of Elaea and the river Caicus coming from Mysia; the town of Pitane; the river Canaitis. Canae has disappeared, as have Lysimachea, Atarnea, Carene, Cisthene, Cilla, Cocyhum, Thebe, Astyre, Chrysa, Palaescepsis, Gergith. Neandros: but there still exist the city-state of Perperene, the district of Heracleotes, the town of Corvphas, the rivers Grylios and Ollius, the district of Aphrodisias which was formerly Politice Orgas, the district of Scepsis, and the river Evenus, on the banks of which stood Lyrnesus and Miletos, both now in ruins. In this region is Mount Ida, and on the coast Adramytteos, formerly called Pedasus, which has given its name to the bay and to the jurisdiction, and the rivers Astron, Cormalos, Crianos, Alabastros, and Holv River coming from Mount Ida; inland are Mount Gargara and the town of the same name. On the coast again are Antandros previously called Edonis, then Cimmeris, and Assos, which is the same as Apollonia; and formerly there was also the town of Palamedium. Then Cape Lectum which marks the frontier between the Aeolid and the Troad also there was once the city-state of Polymedia, and Chrysa and another Larisa: the temple of Znintheus still stands. Colone inland has disappeared. Adramytteos is resorted to for legal business by the people of Apollonia on the river Rhyndaeus, the Eresi, Miletopolitae, Poemaneni, Macedonian Asculacae, Polichnaei, Pionitae, the Cilician Mandacandeni, the Mysian peoples known as the Abretteni and the Hellespontii, and others of no note

33. The first place in the Troad is Hamaxitus, then come Cebrenia, and then Troas itself, formerly called Antigonia and now Alexandria, a Roman colony; the town of Nee; the navigable river Scamander; and on a promontory was formerly the town of Sigeum. Then the Harbour of the Achaeans, into which flows the Xanthus united with the Simois, and the Palaescamander, which previously forms a marsh. Of the rest of the places celebrated in Homer, Rhesus, Heptaporus, Caresus, Rhodius, no traces remain; and the Granicus flows by a different route into the Sea of Marmara. However there is even now the small city-state of Scamander. and 4 miles from its harbour Ilium, a town exempt from tribute, the scene of all the famous story. Outside the bay, are the Rhoetean coasts, occupied by the towns of Rhoeteum, Dardanium and Arisbe. Formerly there was also the town of Achilleon, founded near to the tomb of Achilles by the people of Mitylene and afterwards rebuilt by the Athenians, where the fleet of Achilles was stationed at Sigeum; and also there once was Aeantion, founded by the Rhodians on the other horn of the bay, which is the place where Ajax was buried, at a distance of 3 miles from Sigeum, and from the actual place where his fleet was stationed. Inland behind Aeolis and a part of the Troad is the district called Teuthrania, inhabited in ancient times by the Mysiansthis is where the river Caicus already mentioned rises. Teuthrania was in a considerable independent clan, even when the whole district hore the name of Mysia. Places in Teuthrania are Pioniae, Andera, Idale, Stabulum, Conisium, Teium, Balce, Tiare, Teuthranie, Sarnaca, Haliseme, Lycide, Parthenium, Cambre, Oxyopiun, Lygdamum, Apollonia, and by far the most famous place in Asia, Pergamum, which is traversed by the river Selinus and

Copyright © 2018 by Lord Henfield, Guildford Scientific Press PAGE 3449 bordered by the river Cetius, flowing down from Mount Pindasus. Not far away is Elaea, which we mentioned, on the coast. The jurisdiction of this district is called the Pergamene, and it is the centre for the Thyatireni, Mossyni, Mygdones, Bregmeni, Hierocometae, Perpereni, Tiareni, Hierolophienses, Hermocapelitae, Attalenses, Panteenses, Apollonidienses and other city-states of no note. At a distance of 8 miles from Rhoeteum is the small town of Dardanium. Eighteen miles from it is Cape Trapeza, from which point the Dardanelles start. A list of Asiatic races now extinct given by Eratosthenes includes the Solymi, Leleges, Bebryces, Colycantii and Tripsedi; Isidore gives the Arienei and the Capreatae at the place where Apamea stands, founded by King Seleucus, between Cilicia, Cappadocia, Cataonia and Armenia. Apamea was originally called Damea because it had subdued some extremely fierce tribes.

34. Of the islands off the coast of Asia the first is at the Canopic mouth of the Nile, and takes its name, it is said, from Menelaus's helmsman Canopus. The second, called Pharos, joined by a bridge to Alexandria, was settled by the Dictator Caesar; it was formerly a day's sail from Egypt, but now it carries a lighthouse to direct the course of vessels at night; for owing to the treacherous shoals Alexandria can be reached by only three channels of the sea, those of Steganus, Posideum and Taurus. Then in the Phoenician Sea off Joppa lies Paria, the whole of which is a townit is said to have been the place where Andromeda was exposed to the monsterand Arados, mentioned already; between which and the mainland, according to Mucianus, fresh water is brought up from a spring at the bottom of the sea, which is 75 feet deep, by means of a leather pipe.

35. The Pampliylian Sea contains some islands of no note. The Cilician Sea has five of considerable size, among them Cyprus, which lies east and west off the coasts of Cilicia and Syria; it was formerly the seat of nine kingdoms. Its circumference is given by Timosthenes as measuring 427 miles and by Isidore as 375 ruiles. Its length between the two capes of Clidae and Acamas, the latter at its west end, is given by Artemidorus as 1624 and by Timosthenes as 200 miles. According to Philonides it was previously called Acamantis, according to Xenagoras Cerastis and Aspelia and Amathusia and Macada, and according to Astynomus Cryptos and Colinias. It contains 15 towns, New and Old Paphos, Curias, Citium, Corinaeum, Salamis, Amathus, Lapethos, Soloe, Tamasos, Epidaurus, Chytri, Arsinoe, Carpasium and Golgoe; and formerly there were also Cinyria, Mareum and Idalium. It is 50 miles from Anemurius in Cilicia; the sea lying between is called the Cilician Aulon. In the same neighbourhood is the island of Eleusa, and the four Clides off the cape facing Syria. and again off a second headland Stiria, and towards New Faphos Hiera and Cepia, and towards Salamis the Salaminiae. In the Lycian Sea are Illyris, Telendos, Attelebussa, the three barren Cyprian islands and Dionysia, formerly called Charaeta; then opposite to Cape Taurus, the Chelidonian islands, the same in number, fraught with disaster for passing vessels. Next to these the Pactyae with the town of Leucolla, Lasia, Nymphais, Maeris and Megista, the city-state on which has ceased to exist; and then a number of islands of no note. But opposite to Chimaera are Dolichiste, Choerogylion, Crambusa, Rhoge, the eight called the Xenagora islands, the two called Daedaleon, and the three called Cryeon; Strongyle, and opposite Sidyma Antiochi and towards the river Glaucus Lagussa, Macris, Didymae, Helbo, Scope, Aspis and Telandria (the town on which has ceased to exist) and nearest to Mount Caunus Rhodussa.

36. But the most beautiful is the free island of Rhodes, which measures 125, or, if we prefer to believe Isidore, 103 miles round, and which contains the cities of Lindus, Camirus and Jalysus, and now that of Rhodes. Its distance from Alexandria in Egypt is 583 miles according to Isidore, 468 according to Eratosthenes, 500 according to Mucianus; and it is 176 miles from Cyprus. It was previously called Ophiussa, Asteria, Aethria, Trinacrie, Corymbia, Poeeessa, Atabyria after its king, and subsequently Macaria and Oloessa. Islands belonging to the Rhodians are Carpathus which has given its name to the Carpathian Sea, Casos, formerly Achne, Nisvros, previously called Porphyris, 15 miles distant from Cnidus, and in the same neighbourhood lying between Rhodes and Cnidus, Syrne. Syrne measures 37 miles in circumference; it provides the welcome of eight harbours. Other islands in the neighbourhood of Rhodes besides those mentioned are Cyclopis, Teganon, Cordylusa, the four Diabatae, Hymos. Chalce with its town, Teutlusa, Narthecusa, Dimastos, Progne, and in the direction of Cnidus Cisserusa, Therionarcia, Calydne with the three towns of Notium, Nisyrus and Mendeterus, and the town of Ceramus on Arconnesus. Off the coast of Caria are the Argiae, a group of twenty islands, and Hyetusa, Lepsia and Leros. But the most famous island in this gulf is that of Cos, which is 15 miles distant from Halicarnassus and 100 miles in circumference; it is generally believed to have been called Merope, but according to Staphylus its former name was Cea and according to Dionysius Meropis and later Nymphaea. On Cos is Mount Prion; and the island of Nisyros, formerly called

Porphyris, is believed to have been severed from Cos. Next to Cos we come to Caryanda with its town; and not far from Halicarnassus, Pidossus. In the Ceramic Bay are Priaponesus, Hipponesus, Pserema, Lampsa, Aemyndus, Passala, Crusa, Pyrrhaeciusa, Sepiusa, Melano, and at only a small distance from the mainland the island named Cinaedopolis, because certain persons of disgraceful character were deposited there by Alexander the Great.

^{37.} Off the coast of Ionia are Aegeae and Corseae, and Icarus previously mentioned, Lade, formerly called Late, and among some islands of no importance the two Camelitae near Miletus, the three Trogiliae near Mycala, Phulios, Argennos, Sandalios, and the free island of Samos, which measures 87, or according to Isidore, 100 miles in circumference. Aristotle records that it was first called Parthenia, afterwards Dryusa, and then Anthemusa; Aristocritus adds the names Melamphyllus, and later Cyparissia, others Parthenoarrhusa and Stephane. Samos contains the rivers Imbrasus, Chesius and Hibiethes, the springs Gigartho and Leucothea, and Mount Cercetius. Adjacent islands are Ilhypara, Nymphaea

38. Ninety-four miles from Samos is the equally famous free island of Chios with its town. This island Ephorus designates by its ancient name of Aethalia, while Metrodorus and Cleobulus call it Chia after the nymph Chione, though some say that name is derived from the Greek word for snow. Other names for it are Macris and Pityusa. It contains Mount Pelinnaeus, in which Chian marble is quarried. Its circumference amounts to 125 miles, according to old accounts, but Isidore adds 9 miles to that figure. It is situated between Samos and Lesbos and directly opposite to Erythrae. Neighbouring islands are Tellusa, by other writers called Daphnusa, Oenusa, Elaphitis, Euryanassa and Arginusa with its town. These islands bring us to the neighbourhood of Ephesus, where are also those called the Islands of Pisistratus. Anthinae, Myonnesus, Diarrheusa (the towns on both these islands have disappeared), Pordoselene with its town, Cerciae, Halone, Commone, Illetia, Lepria, Aethre, Sphaeria, Procusae, Bolbulae, Pheate, Priapos, Syce, Melane, Aenare, Sidusa, Pele, Drymusa, Anhydros, Scopclos, Sycussa, Marathusa, Psile, Perirrheusa, and many others of no note. Out at sea is the famous island of Teos with its town, 71 miles from Chios and the same distance from Erythrae. Near Smyrna are the Peristerides, Carteria, Alopece, Elaeusa, Bacchina, Pystira, Crommyonnesos, Megale. Off the Troad are Ascaniae, the three Plateae, then Larniae, the two Plitaniae, Plate, Scopelos, Getone, Arthedon, Coele, Lagusae, Didymae

39. The most famous island is Lesbos, 65 miles from Chios; it was formerly called Himerte and Lasia, Pelasgia, Aegira, Aethiope and Macaria. It had nine noteworthy towns: of these Pyrrha has been swallowed up by the sea, Arisbe destroyed by earthquake and Antissa absorbed by Methymna, which itself lies near nine cities of Asia, along a coastline of 37 miles. Agamede and Hiera have also ceased to exist: but there remain Eresos, Pyrrhaa and the free city of Mytilene, which has been powerful for 1500 years. The circuit of the whole island measures 168 miles according to Isidore and 195 miles according to old authorities. The mountains on Lesbos are Lepetyrnnus, Ordymnus, Macistus, Creone and Olympus. It is 7 miles distant from the nearest point of the mainland. Adjacent islands are Sandalium and the five Leucae, which include Cydonea with its hot spring; four miles from Aege are the Arginussae and then Phellusa and Pedna. Outside the Dardanelles and opposite the coast of Sigeum lies Tenedos, also called Leucophrys and Phoenice and Lyrnesos; it is 56 miles from Lesbos and 12 from Sigeum.

40. Here the current of the Dardanelles becomes stronger. and comes into collision with the sea, undermining the bar with its eddies until it separates Asia from Europe. We have already given the name of the promontory here as Trapeza. Ten miles from it is the town of Abydus, where the strait is only 7 furlongs wide; then the town of Percote, and Lampsacus formerly called Pityusa, the colony of Parium, called by Homer Adrastia, the town of Priapos, the river Aesepus, Zelia, and the Sea of Mannara (the name given to the Straits where the sea widens out), the river Oranicus and the harbour of Artace, where there once was a town. Beyond is the island which Alexander joined to the mainland and on which is the Milesian town of Cyzicus, formerly called Arctonnesus and Dolionis and Didymis; above it is Mount Didymus. Then the towns of Placia, Ariace and Scylace, and in their rear the mountain called the Mysian Olympus and the city-state of Olympena. The rivers are the Horisius and the Rhyndacus, formerly called the Lycus: this rises in the marsh of Artynia near Miletopolis, and into it flow the Macestos and several other rivers; it forms the boundary between Asia and Bithynia. This district was formerly named Cronia, then Thessalis and then Malianda and Strymonis: its inhabitants were called by Homer the Halizones, as the tribe is 'girdled by the sea.' It once had a vast city named Atussa, and it now includes twelve city-states, among them Gordiu Come otherwise called Juliopolis, and on the coast Dascylos. Then there is the river Gelbes, and inland the town of Helgas, also

called Germanicopolis, another name for it being Boos Coete; as also Apamea now known as Myrlea of the Colophonii; and the river Echeleos which in early times was the frontier of the Troad, and at which Mysia began. Afterwards the bay in which are the river Ascanius, the town of Bryalion, the rivers Hylas and Cios, with the town also named Cios, formerly a trading station for the neighbouring district of Phrygia, founded by the people of Miletus but on a site formerly known as Ascania of Phrygia: consequently this is as suitable a place as any other to speak about Phrygia.

41. Phrygia lies behind Troas and the peoples already mentioned between Cape Lectum and the river Echeleus. On its northern side it marches with Galatia, on its southern side with Lycaonia, Pisidia and Mygdonia, and on the east it extends to Cappadocia. Its most famous towns beside the ones already mentioned are Aneyra, Andria, Celaenae, Cobossae, Carina, Cotyaion, Ceraine, Coniuni and Midaiuni. Some authorities say that the Mysians, Phrygians and Bithynians take their names from three parties of immigrants who crossed over from Europe, the Moesi, Brygi and Thyni.

42. At the same time it seems proper to speak also about Galatia, which lies above Phrygia and holds lands that for the most part were taken from that country, as was Gordium, its former capital. This district is occupied by Gallic settlers called the Tolistobogii, Voturi and Ambitouti, and those occupying the Maeonian and Paphlagonian region are the Trogmi. Along the north and east of Galatia stretches Cappadocia, the most fertile part of which has been occupied by the Tectosages and Toutobodiaci. These are the races that inhabit the country; the peoples and tetrarchies into which they are divided number 195 in all. The towns are Ancyra belonging to the Tectosages, Tavium to the Trogini and Pisinus to the Tolistobogii. Noteworthy people besides these are the Actalenses, Alassenses, Comenses, Didienses, Hierorenses, Lystreni, Neapolitani, Oeandenses, Seleucenses, Sebasteni, Timoniacenses and Thebaseni. Galatia also touches on Cabalia in Pamphylia and the Milyae about Bans; also on Cyllanicum and the district of Oroanda in Pisidia, and Obizene which is part of Lycaonia. The rivers in it beside those already mentioned are the Sakarya and the Gallus; from the latter the priests of the Mother of the Gods take their name

43. Now we give the remainder of the places on this coast. Inland from Cios, in Bithynia, is Prusa, at the foot of Olympus, founded by Hannibalfrom there to Nicaea is 25 miles, Lake Ascanias coming in betweenthen, on the innermost bay of the lake, Nicaea, which was formerly called Olbia, and Prusias; then a second place also named Prusias at the foot of Mount Hypius. Places that exist no longer are Pythopolis, Parthenopolis and Coryphanta. On the coast are the rivers Aesius, Bryazon, Plataneus, Areus, Aesyrus and Geodos, another name for which is Chrysorrhoas, and the headland on which formerly the town of Megarice stood: owing to which the gulf used to have the name of Craspedites, because that town was a sort of tassel on its fringe. There was also formerly the town of Astacus, owing to which the gulf in question was also called Astacus Bay. Also there was a town called Libyssa at the place where there is now only the tomb of Hannibal; and also at the far extremity of the bay stands the famous city of Bithynian Nicomedia. Cape Leucatas which shuts in Astacus Bay is 37 miles from Nicomedia; and then the coastlines come together again, forming narrows that extend as far as the Straits of Constantinople. On these narrows are the free city of Calchadon, previously called Procerastis, 62 miles from Nicodemia, then Colpusa, afterwards Bhnd Men's Towna name implying that its founders did not know how to choose a site. Byzantium a site so much more attractive in every respect being less than a mile away! Inland in Bithynia are the colony of Apamea, Agrippenses, Juliopolitae and Bithynion. The rivers are the Syriurn, Laphias, Pharnacias, Alces, Serinis, Lilaeus, Scopius and Hieros, which forms the frontier between Bithynia and Galatia. Beyond Calchadon formerly stood Chrysopolis. Then Nicopohs, from which comes the name still given to the bay containing Port of Amycus; then Cape Naulochum, Hestiae and Neptune's Temple. Then come the Straits of Constantinople, the channel half a mile wide which again separates Asia from Europe, 12 miles from Calchadon. Then the mouth of the Straits, 8 miles wide, where once stood the town of Spiropolis. The whole of the coast is inhabited by the Thynians and the interior by the Bithynians. This is the end of Asia and of the 282 peoples who can be counted between the frontier of Lycia and this point. The length of the Dardanelles and the Sea of Marmara to the Straits of Constantinople we stated above as 239 miles, and the distance from Calchadon to Sigeum is given by Isidore as 322 miles.

44. The islands in the Marmara are, Elaphonnesus off Cyzicus, from which is obtained the Cyzicus marbleit is also called Neuris and Proconnesusand then Ophiussa, Acanthus, Phoebe, Scopelos, Porphyrione, Halone with its town, Delphacie, Polydora and Artacaeon with its town. Also off Nicomedia is Demonnesus, and also beyond Heraclea and off Bithynia Thynias, the native name of which is Bithynia. There is also Antiochia, and off the mouth of the Rhyndacus Besbicos, an island 18 miles in circumference; and also Elaea and the two Rhodusae, Erebinthote, Megale, Chalcitis and Pityodes.

NATURAL HISTORY BOOK 6

1. The Euxine or Black Sea, formerly because of its inhospitable roughness called the Axine, owing to a peculiar jealousy on the part of Nature, which here indulges the sea's greed without any limit, actually spreads into Europe and Asia. The Ocean was not content to have encircled the earth, and with still further cruelty to have reft away a portion of her surface, nor to have forced an entrance through a breach in the mountains and rent Gibraltar away from Africa, so devouring a larger area than it left remaining, nor to have swallowed up a further space of land and flooded the Sea of Marmara through the Dardanelles; even beyond the Straits of Constantinople also it widens out into another desolate expanse, with an appetite unsatisfied until the Sea of Azov links on its own trespass to its encroachments. That this event occurred against the will of the earth is proved by the number of narrows, and by the smallness of the gaps left by Nature's resistance, measuring at the Dardanelles 875 paces, at the Straits of Constantinople and Kertsch the passage being actually fordable by oxenwhich fact gives both of them their name and also by a certain harmonious affinity contained in their disseverance, as the singing of birds and barking of dogs on one side can be heard on the other, and even the interchange of human speech, conversation going on between the two worlds, save when the actual sound is carried away by the wind.

The dimension of the Black Sea from the Dardanelles to the Sea of Azov is given by some authorities as 1438 miles, but Eratosthenes makes it 100 miles less. Agrippa gives the distance from Calchadon to the river Won as 1000 miles and from that river to the Straits of Kertsch as 360 miles. We shall state the distances in sections as ascertained in our own time, inasmuch as there has been dispute even about the mouth of the Straits of Kertsch.

Well then, after the mouth of the Dardanelles is the river Rebas, called by some the Rhesus; then Syris, and Port Calpas, and the Sakarya, a famous river which rises in Phrygia and into which flow some very large tributaries, among them the Tembrogius and the Gallus; its name is commonly given as Sagiarius; the Coralius where the Mariandyni territory begins; the bay of Heraclea, and the town of that name on the river Lycusit is 200 miles from the mouth of the Black Seathe port of Aconae, of evil repute for the poison called aconite, the Acherusian Cavern, the rivers Paedopides, Callichorus and Sonautes, the town of Tium 38 miles from Heraclea, and the river Billis.

2. Beyond this river is the Paphlagonian race, called by some the Pylaemenian, enclosed to the rear by Galatia, the Milesian town of Mastya, then Cromna, a place with which Cornelius Nepos connects the Eneti, from whom he thinks the Veneti in Italy bearing a similar name must be believed to be descended; the town of Sesamon, now called Amastris; Mount Cytorus, 63 miles from Tium; the towns of Cimolis and Stephane and the river Parthenius. The great projection of Cape Cerambis is 325 nines, or according to others 350 miles, distant from the mouth of the Black Sea, and the same distance, or, by an estimate which some prefer, 3121 miles from the Straits of Kertsch. There was formerly also a town of the same name, and then another called Armine; and at the present day there is the colony of Sinb, 164 miles from Mount Cytorus; the river Evarchus, a tribe of Cappadocians, the town of Caturia Zacepluni, and the river Halys that flows down from the base of Mount Taurus through Cataonia and Cappadocia; the towns of Gamge and Carusa, the free town of Amisus 130 miles from Sinb, and the bay of the same name which runs so far inland as to give to Asia the shape of a peninsula,b the isthmus measuring not more than 200 miles across to the Gulf of Issus in Cilicia. It is reported that in all this region there are only three races that can rightly be designated Greek, the Dorian, the Ionian and the Aeolian, all the rest being tribes of barbarians. To Amisus was attached the town of Eupatoria, founded by Mithridates; after he had been conquered, the two places were united under the name of Pompeiopolis.

3. Cappadocia contains in its interior a colony of Claudius Caesar named Archelais, past which flows the river Halys, and the towns of Comana on the Salius. Neocaesarea on the Lycus. and Amasia on the Iris in the region of Gazacena; while in the Colopene region are Sebastia and Sebastopol, which are small towns but equal in importance to those mentioned above; and in the remaining part of Cappadocia are Melita, founded by Samiramis, not far from the Euphrates, Diocaesarea, Tyana, Castabala, Magnopolis, Zela, and under Mount Argaeus Mazacus, now named Caesarea. The part of Cappadocia adjacent to Greater Armenia is called Melitene, the part bordering on Commagene Cataonia, that on Phrygia Garsanritis, that on Cammanene Sargaurasana, that on Galatia Morimene, where the boundary between the two countries is formed by the river Cappadox, from which the Cappadocians take their namethey were formerly called the White Syrians. The boundary between Neocaesarea above mentioned and Lesser Armenia is the river Lycus. In the interior there is also the notable river Coeranus, and on the coast after Amisus the town of Chadisia with the river of the same name, and the town of Lycastns, after which the district of Themiscyra begins. The river here is the Iris, with a tributary the Lycus. Inland is Ziela, the city-state famous for the defeat of Triarius and the victory of Gaius Caesar. On the coast is the river Thermodon, which rises at the fortress called Phanollas and flows past the foot of the mountain Mason Dagh; there was formerly a town of the same name as the river, and five others, Amazonium, Themiscyra, Sotira, Amasia and Comana, and now there is Matium;

4. the Caenares and Chalybes tribes, the town of the Cotyi, the tribes of the Tibareni and the Massynithe latter practise tattooingthe Longhead tribe, the town of Cerasus, the harbour of Cordule, the Bechires and Buxeri tribes, the Black River, the Machorones tribe, the Sideni, and the river Sidenus which washes the town of Polemonium 120 miles from Amisus. Then come the rivers Tasonius and Melanthius, and 80 miles from Amisus the town of Pharnacea, the fortress and river Tripolis, the fortress and river Philocalia and the fortress of Liviopolis, which is not on a river, and 100 miles from Pharnacea the free town of Trebizond, shut in by a vast Beyond Trebizond begins the mountain range. Armenochalybes tribe, and 30 miles further Greater Armenia On the coast before reaching Trebizond is the river Pyxites, and beyond Trebizond the Charioteer Sanni, and the river Absarrus with the fortress of the same name in its gorge, 140 miles from Trapezus. Behind the mountains of this district is Liberia, and on the coast the Charioteers, the Ampreutae and the Lazi, the rivers Acampseon, Isis, Mogrus and Bathys, the Colchian tribes, the town of Matium, the River of Heracles and the cape of the same name, and the Rion, the most celebrated river of the Black Sea region. The Rion rises among the Moschi and is navigable for ships of any size for 38 miles, and a long way further for smaller vessels; it is crossed by 120 bridges. It had a considerable number of towns on its banks, the most notable being Tyndaris, Circaeus, Cygnus, and at its mouth Phasis; but the most famous was Aea, 15 miles from the sea, where two very large tributaries join the Rion from opposite directions, the Hippos and the Cvaneos. At the present day the only town on the Rion is Surium, which itself also takes its name from a river that enters the Rion at the point up to which we said that it is navigable for large vessels. It also receives other tributaries remarkable for their size and number, among them the Glaucus; at its mouth is an island with no name. 70 miles from the mouth of the Absarrus. Then there is another river, the Charicis, the Saltiae tribe called of old the Pine-seed-eaters, and another tribe, the Sanni; the river Chobus flowing from the Caucasus through the Suani territory; then Rhoan, the Cegritic district, the rivers Sigania, Thersos, Astelphus and Chrysorrhoas, the Absilae tribe, the fortress of Sebastopol 100 miles from Phasis, the Sanicae tribe, the town of Cygnus, the river and town of Penius; and then tribes of the Charioteers with a variety of names.

5. Below this lies the Black Sea district named Colica, in which the Caucasus range curves round to the Ripaean Mountains, as we have previously stated, one side sloping down towards the Black Sea and the Sea of Azov, and the other towards the Caspian and Hyrcanian Sea. The tribes occupying almost all the rest of the coasts are the Blackcloaks and the Coraxi, with the Colchian city of Dioscurias on the river Anthemus, now deserted, but once so famous that according to Timosthenes 300 tribes speaking different languages used to resort to it; and subsequently business was carried on there by Roman traders with the help of a staff of 130 interpreters. Some people think that Dioscurias was founded by the charioteers of Castor and Pollux, Amphitus and Thelchius, from whom it is virtually certain that the Charioteer tribe are descended. The town of Heracleum is 100 miles from Dioscurias and 70 miles from Sebastopol. The tribes here are the Achaei, Mardi and Cercetae, and after these the Serri and Cephslotomi. In the interior of this region was the extremely wealthy town of Pityus, which was sacked by the Charioteers. Behind Pityus are the Epagerritae, a Sarmatian people on the Caucasus range, and after them come the Sauromatians. It was with this tribe that Mithridates took refuge in the principate of Claudius, and from him we learn that there is a neighbouring tribe, the Thali, who on the eastern side extend to the mouth of the Caspian Sea, where, he tells us, the channel dries up at low tide. On the coast of the Black Sea near the Cercetae is the river Icarus, and the Achaei, with their Holy Town and River, 136 miles from Heracleum. Then comes Cape Cruni, after which a steep cliff is occupied by the Toretae, and then the city-state of Sindica, 67 miles from Holy Town, and the river Secheries.

6. The distance from the Secheries to the entrance to the Straits of Kertsch is 88 miles. But the actual peninsula projecting between the Black Sea and the Sea of Azov is not more than 671 miles long, its breadth being nowhere below 80 yards; it is called Eone. The actual coast of the Straits on both the Asiatic and the European sides curves into the Sea of Azov. The towns at its entrance are Hermonasa and next the Milesian town of Cepi, then Stratoclia and Phanagoria and the almost deserted town of Apaturos, and at the extreme end of the mouth Cimmerium, the former name of which was Cerberion.

7. Then comes the Sea of Azov, which is held to be in Europe.

After passing Cimmerium, the tribes inhabiting the coast are the Maeotici, Hali, Semes, Serrei, Scizi and Gnissi, Next come the two mouths of the river Don, where the inhabitants are the Sarmatae, said to be descended from the Medes, and themselves divided into a number of sections. The first of these are the Matriarchal Sauromatae, the husbands of the Amazons; then the Naevazae, Coitae, Cizici, Messeniani, Cotobacchi. Cetae. Zigae, Tindari, Thussegetae and Tyrcae, which brings us to uninhabited deserts intersected by wooded glens, beyond which are the Arixnphaei, who reach to the Ripaean Mountains. The Don itself is called by the natives the Sinus, and the Sea of Azov the Temarunda, which means in their language 'the mother of the sea.' There is also a town at the mouth of the Don. The neighbouring districts were first occupied by the Carians, then by the Clazomenii and Maeones. and afterwards by the Panticapaeans. Some give the following list of tribes round the Sea of Azov near the Ceraunian Mountains: starting from the coast the Naprae, and higher up the Essedones, joining on to the Colchians on the tops of the mountains. Then the Camacae, Orani, Autacae, Mazamacae, Cantiocaptae, Agamathae, Pici, Itymosoli and Acascomarci, and near the Caucasus range the Icatalae. Imadochi, Rami, Andacae, Tydii, Carastasei and Authiandes; the river Lagous flowing down from the Cathean Mountains, with its tributary the Opharus, where are the Cauthadae and Opharitae tribes; the rivers Menotharus and Imityes flowing from the Cissian Mountains; below these the Agdaes, Carnae, Oscardei, Accisi, Gabri and Gegari, and round the source of the Imitves the Imitvi and Apartaei. Other writers say that the Scythian tribes of the Auchetae, Athernei and Asampatae have spread into this country, and have destroyed the Tanaitae and Inapaei to a man. Some state that the river Ocharius runs through the Cantici and Sapei, but that the Don has passed through the Hertichean tribe of Satharchei, the Spondolici, Synhietae, Anasi, Issi, Cataeetae, Tagorae, Caroni, Neripi, Agandei, Meandaraei and Spalaean Satharchei.

8. We have gone over the inner coast of Asia from the river Cius and all the tribes dwelling on it; let us now give an account of the vast region that lies in the interior. I do not deny that my description of it will differ in many points from that of the old writers, as I have devoted much care and attention to ascertaining thoroughly the recent events in that region from Domitius Corbulo and the kings sent from there as suppliants or king's children sent as hostages. We will however begin with the Cappadocian tribe. This extends farthest into the interior of all the peoples of Pontus, passing on its left-hand side Lesser and Greater Armenia and Commagene and on its right all the tribes of Asia mentioned above; it spreads over a very large number of peoples, and rises rapidly in elevation towards the east in the direction of the Taurus range, passing Lycaonia, Pisidia and Cilicia, and then advances above the district of Antiochia, the part of it called Cataoruia reaching as far as the department of Antiochia named Cyrrestica. Consequently the length of Asia at this point is 1250 miles and its breadth 640 miles.

9. Greater Armenia begins at the Parihedri Mountains, and is separated from Cappadocia, as we have said, by the river Euphrates and, when the Euphrates turns aside from Mesopotamia by the equally famous river Tigris. Both rivers rise in Armenia, and it forms the beginning of Mesopotamia, the tract of country lying between these two rivers; the intervening space is occupied by the Orroean Arabs. It thus extends its frontier as far as Adiabene, where it is enclosed by ranges of mountains that stretch across it; here it spreads its width on the left, crossing the Aras, to the river Kur, while its length reaches right to Lesser Armenia, from which it is separated by the river Absarrus, which flows into the Black Sea, and by the Parihedri Mountains in which the Absarrus rises.

10. The source of the Kur is in the Heniochi Mountains, which are called by some persons the Coraxici; while the Aras rises in the same mountains as the Euphrates, at a distance of six miles from it, and after being augmented by the river Usis, itself also, in the opinion of the majority of writers, joins the Kur and is carried by it down into the Caspian Sea.

The notable towns in Lesser Armenia are Caesarea, Ezaz and Nicopolis; those in Greater Armenia are Arsamosata, which is near the Euphrates, Kharput on the Tigris and Sert on the high ground, with Artaxata in the plains adjoining the Araxes. Aufidius gives the circumference of the whole of Armenia as 5000 miles, while Claudius Caesar makes its length from Dascusa to the edge of the Caspian Sea 1300 miles and its breadth from Sert to Hiberia half that amount. It is a well-known fact that it is divided into 120 administrative districts with native names, called in Greek military commands, some of which were formerly actual separate kingdoms. It is shut in on the east, but not immediately, by the Ceraunian Mountains and similarly by the Adiabene district. The intervening space is occupied by the Cepheni, and next to them the mountain district beyond is occupied by the Adiabeni, while along the valleys the peoples adjoining Armenia are the Menobardi and Moscheni. Adiabene is encircled by the Tigris and by impassable mountains. The district on the left of Adiabene belongs to the Medes, as far as the point where the Caspian Sea comes into view; this sea derives its water from the Ocean, as we shall say in the proper place, and is entirely surrounded by the Caucasus Mountains.

We shall now mention the peoples dwelling along the border of Armenia.

11. All the plain from the Kur onward is occupied by the race of the Albani and then that of the Hiberes, separated from the Albani by the river Alazon, which flows down from Mount Caucasus into the Cyrus. Important towns are Kablas-Var in Albania and Hermastus on the river and Neoris in Hiberia. The districts of Thasie and Thriare reach to the Parihedri Mountains, and beyond them is the Colebian desert, on the side of which towards the Ceraunii dwell the Armenochalybes, and the country of the Moschi reaching to the river Hiberus, a tributary of the Kur, and below them the Sacasani and then the Macerones reaching to the river Absarrus. This gives the population of the plains or mountain slopes; then after the frontier of Albania the whole face of the mountains is occupied by the wild tribes of the Silvi and below them those of the Lupenii, and afterwards the Diduri and Sodi.

12. On leaving these one comes to the Gates of the Caucasus, which many very erroneously call the Caspian Gates, an enormous work of Nature, who has here suddenly rent the mountains asunder. Here gates have been placed, with ironcovered beams, under the centre of which flows a river emitting a horrible odour; and on this side of it on a rock stands the fortress called Cumania, erected for the purpose of barring the passage of the innumerable tribes. At this spot therefore the world is divided by gates into two portions; it is just opposite the liberian town of Hermastus. Beyond the Gates of the Caucasus among the Gurdinian Mountains are the Valli and the Suani, races never yet quelled, who nevertheless work goldmines. After these, right on to the Black Sea, are a large number of tribes of Charioteers and then of Achaei. Such is the present state of one of the most famous regions in the world.

Some authorities have reported the distance between the Black Sea and the Caspian as not more than 375 miles, while Cornelius Nepos makes it 250 miles: by such narrow straits is Asia for a second time beset. Claudius Caesar gives the distance from the Straits of Kertseh to the Caspian Sea as 150 miles, and states that Seleueus Nicator at the time when he was killed by Ptolemy Cerannus was contemplating cutting a channel through this isthmus. It is practically certain that the distance from the Gates of the Caucasus to the Black Sea is 200 miles.

13. The islands in the Black Sea are the Planctae, otherwise named the Cyaneae or Symplegades, and then Apollonia, called Thynias to distinguish it from the island of the same name in Europeit is a mile away from the mainland and three miles in circumferenceand opposite to Pharnacea Chaleeritis, called by the Greeks the Isle of Arcs and sacred to the god of war; they say that on it there were birds which used to attack strangers with blows of their wings.

14. Having now completed our description of the interior of Asia let us in imagination cross the Ripaean Mountains and proceed to the right along the shores of the Ocean. This washes the coast of Asia towards three points of the compass, under the name of Scythian Ocean on the north. Eastern Ocean on the east and Indian Ocean on the south; and it is subdivided into a variety of designations according to the bays that it forms and the people dwelling on its coasts. A great portion of Asia however also, adjoining the north, owing to the severity of its frosty climate contains vast deserts. From the extreme north-north-east to the northernmost point at which the sun rises in summer there are the Scythians, and outside of them and beyond the point where north-north-east begins some have placed the Hyperboreans, who are said by a majority of authorities to be in Europe. After that point the first place known is Lytharmis, a promontory of Celtica, and the river Carambucis, where the range of the Ripaean Monntains terminates and with it the rigour of the climate relaxes; here we have reports of a people called the Arimphaei, a race not unlike the Hyperboreans. They dwell in forests and live on berries; long hair is deemed to be disgraceful in the case of women and men alike; and their manners are mild. Consequently they are reported to be deemed a sacred race and to be left unmolested even by the savage tribes among their neighbours, this immunity not being confined to themselves but extended also to people who have fled to them for refuge. Beyond them we come directly to the Scythians. Cimmerians, Cissi, Anthi, Georgi, and a race of Amazons, the last reaching to the Caspian and Hyrcanian Sea.

15. For the sea actually forces a passage from the Scythian Ocean to the back of Asia, where the inhabitants call it by a variety of names, but it is best known by two of them, as the Caspian Sea and the Hyrcanian. Clitarchus is of opinion that the Caspian is as large as the Black Sea; Eratosthenes also gives its dimensions on the south-east side along the coast of Cadusia and Albania as 725 miles, from there through the territories of the Atiaei, Amarbi and Hyrcani to the mouth of the river Zonus 600 miles, and from there to the mouth of the Syr Daria 300 miles, making a total of 1575 miles. Artemidorus subtracts 25 miles from this total. Agrippa states that the Caspian Sea and the races surrounding it, including Armenia, bounded on the east by the Chinese Ocean, on the west by the ranges of the Caucasus, on the south by those of the Taurus and on the north by the Scythian Ocean, so far as is known extend 480 miles in length and 290 miles in breadth. But there are some authors who give the entire circuit of the sea in question from the straits as 2500 miles.

Its waters make their way into this sea by a narrow mouth of considerable length; and where it begins to widen out it curves obliquely with crescent-shaped horns, as though descending from the mouth to the Sea of Azov, in the likeness of a sickle, as Marcus Varro states. The first part of it is called the Scythian Gulf because the inhabitants on both sides are Scythians, who hold communication across the narrows, on one side being the Nomads and the Sauromatae, who have a variety of names, and on the other the Abzoae, with just as many. Starting at the entrance, on the right-hand side the actual point of the mouth is occupied by the Scythian tribe of the Udini; then along the coast are the Albani, said to be descended from Jason, after whom the sea at that point is called the Alban Sea. This race overflows the Caucasus Mountains and, as previously stated, comes down as far as the river Kur, which forms the boundary between Armenia and Hiberia. Above the coastward parts of Albania and the Udini tribe stretch the Sarmatae, Utidorsi and Aroteres, in the rear of whom we have already indicated the Amazons and Sauromatides. The rivers running down to the sea through Albania are the Casus and the Albanus, then the Cambyses, which rises in the Caucasus Mountains, and then the Kur, rising in the Coraxaci, as we have said. The whole of the coast. from the Casus is stated by Agrippa to be formed of very lofty cliffs which prohibit landing for 425 miles. The sea begins to have the name of Caspian from the mouth of the Kur, the coast being inhabited by the Caspii.

In this place we must correct a mistake made by many people, even those who recently served with Corbulo in the war in Armenia. These have given the name of Caspian Gates to the pass in Hiberia, which, as we have stated, is called the Gates of the Caucasus, and maps of the region sent home from the front have this name written on them. Also the expedition threatened by the Emperor Nero was spoken of as intended to penetrate to the Caspian Gates, whereas it was really aimed at the pass that gives a road through Hiberia to Sarmatia, the mountain barrier affording scarcely any access to the Caspian Sea. There are however other Caspian Gates adjoining the Caspian tribes; the distinction between the two passes can only be established by means of the report of those who accompanied the expedition of Alexander the Great.

16. The kingdom of the Persians, which we now know as Parthia, lies between the two seas, the Persian and the Caspian, on the heights of the Caucasus range. Greater Armenia, which occupies the front of the mountain sloping towards Commagene, is adjoined, as we have said, by Cephenia, which lies on the descent on both sides of it, and this by Adiabene, where the land of the Assyrians begins; the part of Adiabene nearest to Syria is Arbilitis, where Alexander conquered Darius. The Macedonians have given to the whole of Adiabene the name of Mygdonia, from its likeness to Mygdonia in Macedon. Its towns are Alexandria and Antiochia, the native name for which is Nesebis; it is 750 miles from Artaxata. There was also once the town of Nineveh. which was on the Tigris facing west, and was formerly very famous. Adjoining the other front of Greater Armenia, which stretches to the Caspian Sea, is Atrapatene, separated from the district of Otene in Armenia by the Aras; its chief town is Gazae, 450 miles from Artaxata and the same distance from Hamadan, the city of the Medes, to which race the Atrapateni belong.

17. Hamadan, the capital of Media, which was founded by King Seleucus, is 750 miles from Great Seleucia and 20 miles from the Caspian Gates. The other towns of Media are Phazaca, Aganzaga and Apamea, called Rhei. The reason for the name 'Gates' is the same as that stated above: the range is here pierced by a narrow pass 8 miles long, scarcely broad enough for a single line of waggon traffic, the whole of it a work of engineering. It is overhung on either side by crags that look as if they had been exposed to the action of fire, the country over a range of 28 miles being entirely waterless; the narrow passage is impeded by a stream of salt water that collects from the rocks and finds an exit by the same way. Moreover the number of snakes renders the route impracticable except in winter.

Joining on to the Adiabeni are the people formerly called the Carduchi and now the Cordueni, past whom flows the river Tigris, and adjoining these are the 'Roadside' Pratitae, as they are called, who hold the Caspian Gates. Running up to these on the other side are the Parthian deserts and the Citheni range; and then comes the very agreeable locality, also belonging to Parthia, called Choara. Here are the two Parthian towns formerly serving for protection against the Medes, Calliope and, on another rock, Issatis; but the actual capital of Parthia, Hecatompylos, is 133 miles from the Gatesso effectively is the Parthian kingdom also shut off by passes. Going out of the Gates one comes at once to the Caspian nation, which extends down to the coast: it is from this people that the pass and the sea obtain their name. On the left there is a mountainous district. Turning back from this people to the river Kur the distance is said to be 225 miles, and going up from the river Kur to the Gates 700 miles; for in the Itineraries of Alexander the Great this pass is made the turning-point of his expeditions, the distance from these Gates to the frontier of India being given as 1961 miles, from the frontier to the town of Balkh, which is the name given to Zariasta, 462 miles, and from Zariasta to the river Syr Darya 620 miles

18. Lying to the east of the Caspians is the region called Apavortene, in which is Darcium, a place noted for its fertility. Then there are the tribes of the Tapyri, Anariaci, Staures and Hyrcani, from whose shores the Caspian beyond the river Sideris begins to be called the Hyreanian Sea; while on this side of the Sideris are the rivers Maziris and Straor, all three streams rise in the Caucasus. Next comes the Margiarte country, famous for its sunny climateit is the only district in that region where the vine is grown; it is shut in all round by a beautiful ring of mountains, 187 miles in circuit, and is difficult of access on account of sandy deserts stretching for a distance of 120 miles; and it is itself situated opposite to the region of Parthia. In Margiane Alexander had founded a city bearing his name, which was destroyed by the barbarians, but Antiochus son of Seleucus re-established a city on the same site, intersected by the river Murghab, which is canalized into Lake Zotha; he had preferred that the city should be named after himself. Its circuit measures 8 miles. This is the place to which the Roman prisoners taken in the disaster of Crassus were brought by Orodes. From the heights of Merv across the ridges of the Caucasus right on to the Bactrians extend the fierce tribe of the Mardi, an independent state. Below this region are the tribes of the Orciani, Common, Berdnigae, Harmatotropi, Citomarae, Comani, Murrasiarae and Mandruani; the rivers Mandrum and Chindrum, and beyond them the Chorasmi, Gandari, Paricani, Zarangae, Arasmi Marotiani, Arsi, Gaeli (called by the Greeks the Cadusii), and Matiani; the town of Heraclea, founded by Alexander and subsequently overthrown, but restored by Antiochus, who gave it the name of Achais: the Drehices, whose territory is intersected by the river Amu Darya rising in Lake Oaxus; the Syrmatae, Oxyttagae, Moci, Bateni, Saraparae; and the Bactri, whose town was called Zariasta from the river, but its name was afterwards changed to Balkh. This race occupies the opposite side of the Hindu Kush over against the sources of the Indus, and is enclosed by the river Ochus. Beyond are the Sogdiani and the town of Panda, and on the farthest confines of their territory Alexandria, founded by Alexander the Great. At this place there are altars set up by Hercules and Father Liber, and also by Cyrus and Semiramis and by Alexander, all of whom found their limit in this region of the world, where they were shut in by the river Syr Darya, which the Scythians call the Sills and which Alexander and his soldiers supposed to be the Don. But this river was crossed by Demodamas, the general of King Seleucus and King Antiochus, whom we are chiefly following in this part of our narrative; and he set up altars to Apollo Didymaeus.

19. Beyond are some tribes of Scythians. To these the Persians have given the general name of Sacae, from the tribe nearest to Persia, but old writers call them the Aranxii, and the Scythians themselves give the name of Chorsar to the Persians and call Mount Caucasus Croucasis, which means 'white with snow.' There is an uncountable number of tribes, numerous enough to live on equal terms with the Parthians; most notable among them are the Sacae, Massagetae, Daliae, Essedones, Astacae, Rumnici, Pestici, Homodoti, Histi, Edones, Camae, Camacae, Euchatae, Cotieri, Authusiani, Psacae, Arimaspi, Antacati, Chroasai and Oetael; among them the Napaei are said to have been destroyed by the Palaei. Notable rivers in their country are the Mandragaeus and the Caspasus. And in regard to no other region is there more discrepancy among authorities, this being due, I believe to the countless numbers and the nomadic habits of the tribes. The water of the Caspian Sea itself was said by Alexander the Great to be sweet to drink, and also Marcus Varro states that good drinking water was conveyed from it for Pompey when he was operating in the neighbourhood of the river during the Mithridatic War; doubtless the size of the rivers flowing into it overcomes the salt. Varro further adds that exploration under the leadership of Pompey ascertained that a seven days' journey from India into the Bactrian country reaches the river Bactrus, a tributary of the Amu Darya, and that Indian merchandize can be conveyed from the Bactrus across the Caspian to the Kur and thence with not more than five days' portage by land can reach Phasis in Pontus.

There are many islands in all parts of the Caspian Sea, but only one of them, Zazata, is particularly notable.

20. After leaving the Caspian Sea and the Scythian Ocean our course takes a bend towards the Eastern Sea as the coast turns to face eastward. The first part of the coast after the Scythian promontory is uninhabitable on account of snow, and the neighbouring region is uncultivated because of the savagery of the tribes that inhabit it. This is the country of the Cannibal Scythians who eat human bodies: consequently the adjacent districts are waste deserts thronging with wild beasts lying in wait for human beings as savage as themselves. Then we come to more Scythians and to more deserts inhabited by wild beasts, until we reach a mountain range called Tabis which forms a cliff over the sea; and not until we have covered nearly half of the length of the coast that faces north-east is that region inhabited. The first human occupants are the people called the Chinese, who are famous for the woollen substance obtained from their forests; after a soaking in water they comb off the white down of the leaves, and so supply our women with the double task of unravelling the threads and weaving them together again; so manifold is the labour employed, and so distant is the region of the globe drawn upon, to enable the Roman matron to flaunt transparent raiment in public. The Chinese, though mild in character, yet resemble wild animals, in that they also shun the company of the remainder of mankind, and wait for trade to come to them. The first river found in their territory is the Psitharas, next the Cambari, and third the Lanos, after which come the Malay Peninsula, the Bay of Cirnaba, the river Atianos and the tribe of the Attacorae on the bay of the same name, sheltered by sunbathed hills from every harmful blast, with the same temperate climate as that in which dwell the Hyperborei. The Attacorae are the subject of a monograph by Amometus, while the Hyperborei have been dealt with in a volume by Hecataeus. After the Attacorae there are the Thuni and Focari tribes, and (coming now to natives of India) the Casiri, situated in the interior in the direction of the Scythiansthe Casiri are cannibals; also the Nomad tribes of India reach this point in their wanderings. Some writers state that these tribes are actually in contact with the Cicones and also the Brisari on the north.

21. We now come to a point after which there is complete agreement as to the racesthe range of mountains called the Himalayas. Here begins the Indian race, bordering not only on the Eastern Sea but on the southern also, which we have designated the Indian Ocean. The part facing east stretches in a straight line until it comes to a bend, and at the point where the Indian Ocean begins its total length is 1875 miles; while from that point onward the southerly bend of the coast according to Eratosthenes covers 2475 miles, finally reaching the river Indus, which is the western boundary of India. A great many authors however give the entire length of the coast as being forty days' and nights' sail and the measurement of the country from north to south as 2850 miles. Agrippa says that it is 3300 miles long and 2300 miles broad. Posidonius gives its measurement from north-east to south-east, making the whole of it face the west side of Gaul, of which he gives the measurement from north-west to south-west; and accordingly he shows by an unquestionable line of argument that India has the advantage of being exposed to the current of the west wind, which makes it healthy. In that country the aspect of the heavens and the rising of the stars are different, and there are two summers and two harvests yearly, separated by a winter accompanied by etesian winds, while at our midwinter it enjoys soft breezes and the sea is navigable. Its races and cities are beyond counting, if one wished to enumerate all of them. For it has been brought to knowledge not only by the armed forces of Alexander the Great and the kings who succeeded him. Seleucus and Antiochus, and their admiral of the fleet Patrocles having sailed round even into the Hyrcanian and Caspian Sea, but also by other Greek authors who have stayed as guests with the Indian kings, for instance Megasthenes, and Dionysius sent by Philadelphus for that purpose, and have also reported as to the strength of these nations. Nevertheless there is no possibility of being exact as to this matter, so discrepant and so difficult to believe are the accounts given. Those who accompanied Alexander the Great have written that the region of India subdued by him contained 5000 towns, none less than two miles in circuit, and nine nations, and that India forms a third of the entire surface of the earth, and that its populations are innumerablewhich is certainly a very probable theory, inasmuch as the Indians are almost the only race that has never migrated from its own territory. From the time of Father Liber to Alexander the Great 153 kings of India are counted in a period of 6451 years and three months. The rivers are of enormous size: it is stated that Alexander sailing on the Indus did never less than 75 miles a day and yet could not reach the mouth of the river in less time than five months and a few days over, and nevertheless it is certain that the Indus is smaller than the Ganges. Seneca also, who among our own writers essayed an account of India, gives its rivers as 60 in number and its races as 118. It would be an equally laborious task to enumerate its mountains: there is a continuous chain formed by Imavus.

Hemodus, Paropanisus and Caucasus, from which the whole country slopes down into an immense plain resembling that of Egypt.

However, in order to give an idea of the geographical description of India we will follow in the footsteps of Alexander the Great. Diognetus and Baeton, the surveyors of his expeditions, write that the distance from the Caspian Gates to the Parthian City of Hecatompylos is the number of miles that we stated above: a from thence to the city of Alexandria of the Arii, which Alexander founded, 575 miles, to the city of the Drangae, Prophthasia, 199 miles, to the town of the Arachosii 565 miles, to Kabul 175 miles, and thence to Alexander's Town 50 miles (in some copies of this record we find different numbers): this city is stated to be situated immediately below the Caucasus: from it to the river Kabul and the Indian town of Peucolatis 237 miles, and thence to the river Indus and the town of Taxilla 60 miles, to the famous river Jhelum 120 miles, to the not less notable Beas 390 milesthis was the terminus of Alexander's journeys, although he crossed the river and dedicated altars upon the opposite bank. The king's actual dispatches also agree with these figures. The remaining distances after the Beas were ascertained by the exploration of Seleucus Nicator; to the Sutlej 169 miles, to the river Jumna the same (some copies add 5 miles), thence to the Ganges 112, to Rhodapha 569 (others give 325 miles in this space), to the town of Callinipaza 167 (others 165), thence to the confluence of the river Jumna and the Ganges 625 (a great many add 13), to the town of Patna 425, to the mouth of the Ganges 637. The races worth mentioning after leaving the Hemodi Mountains (a projection of which is called the Imaus, which in the vernacular means 'snowy') are the Isari, Cosiri, Izi, and spread over the range the Chirotosagi and a number of tribes with the name of Bragmanae, among them the Mactocalingae; the rivers are the Prinas and Cainnas, the latter a tributary of the Ganges, both of them navigable; then the tribes of the Calingae nearest the sea, and further inland the Mandaei, the Malli occupying Mount Malhis, and the river Ganges, which is the boundary of this region.

22. The Ganges is said by some people to rise from unknown sources like the Nile and to irrigate the neighbouring country in the same manner, but others say that its source is in the mountains of Scythia, and that it has nineteen tributaries, among which the navigable ones besides those already mentioned are the Crenacca, Rhamnumbova, Casuagus and Sonus. Others state that it bursts forth with a loud roar at its very source, and after falling over crags and cliffs as soon as it reaches fairly level country finds hospitality in a certain lake, and flows out of it in a gentle stream with a breadth of 5 miles where narrowest, and 14 miles as its average width, and nowhere less than 100 feet deep, the last race situated on its banks being that of the Gangarid Calingae: the city where their king lives is called Pertalis. This monarch has 60,000 infantry, 1000 cavalry and 700 elephants always equipped ready for active service. For the peoples of the more civilised Indian races are divided into many classes in their mode of life: they cultivate the land, others engage in military service, others export native merchandise and import goods from abroad, while the best and wealthiest administer the government and serve as judges and as counsellors of the kings. There is a fifth class of persons devoted to wisdom which is held in high honour with these people and almost elevated into a religion; those of this class always end their life by a voluntary death upon a pyre to which they have previously themselves set light. There is one class besides these, half-wild people devoted to the laborious taskfrom which the classes above mentioned are kept awayof hunting and taming elephants; these they use for ploughing and for transport, these are their commonest kind of cattle, and these they employ when fighting in battle and defending their country: elephants to use in war are chosen for their strength and age and size. There is a very spacious island in the Ganges containing a single race named the Modogalinga race. Beyond it are situated the Modubae, the Molindae, the Uberae with a magnificent town of the same name, the Modressae, Praeti, Aclissae, Sasuri, Fassulae, Colebae, Orumcolae, Abali and Thalutae: the king of the latter tribe has an army of 50,000 infantry, 4000 cavalry and 4000 elephants. Next come the Andarae, a more powerful tribe, with a great many villages and thirty towns fortified with walls and towers; they furnish their king with 100,000 infantry, 2000 cavalry and 1000 elephants. The country of the Dardae produces gold in great quantity, and that of the Setae silver also. But almost the whole of the peoples of India and not only those in this district are surpassed in power and glory by the Prasi, with their very large and wealthy city of Patna, from which some people give the name of Palibothri to the race itself, and indeed to the whole tract of country from the Ganges. Their king maintains and pays a standing army of 60,000 foot, 30,000 horse and 9000 elephants, from which the vastness of his wealth may be conjectured. Further up country from these are the Monaedes and the Suari, in whose domain is Mount Malens upon which shadows fall towards the north in winter and towards the south in summer, for periods of six months

alternately. According to Baeton the constellation of the Great Bear is only visible in this region one time in the year, and only for a period of a fortnight; and Megasthenes says that the same thing occurs in many other places in India. The Indian name for their southern region is Diamasa. The river Jumna runs through the Palibothri country into the Ganges between the towns of Muttra and Chrysobora. In the region to the south of the Ganges the tribes are browned by the heat of the sun to the extent of being coloured, though not as yet burnt black like the Ethiopians; the nearer they get to the Indus the more colour they display. We come to the Indus immediately after leaving the Prasii, a tribe in whose mountain regions there is said to be a race of Pygmies. Artemidorus gives the distance from the Ganges to the Indus as 2100 miles.

23. The Indus, the native name for which is Sindus, rises on the east side of a ridge of Mount Caucasus called Hindu Kush; in its course it receives nineteen tributaries, the best known being the Jhelum which brings with it four other streams, the Cantaba which brings three, and the Chenab and the Beas, themselves navigable rivers. Owing however to a certain limitation in its supply of water the Indus is nowhere more than 6 miles wide or 75 feet deep; and it forms an island of considerable size named Prasiane and another smaller one named Patale. The main river is navigable for a distance of 1240 miles according to the most moderate accounts, and it discharges into the ocean after following the sun course in some measure westward. I will give the measurement of the coastline to the mouth of the river by stages as I find it, although none of the various reports of it agree with one another; from the mouth of the Ganges to the Cape of the Calingae and the town of Dandaguda 625 miles, to Tropina 1225 miles, to the Cape of Perimula, where is the most celebrated trading-place of India, 750 miles, to the town of Patala on the island which we have mentioned above, 620 miles

Between the Indus and the Jumna are the mountain tribes of the Caesi, the forester Caetriboni, and then the Megallae (whose king possesses 500 elephants and an uncertain number of infantry and cavalry), the Chrysei, the Parasangae and the Asmagi, whose district is infested by the wild tiger: they have an armed force of 30,000 foot, 300 elephants and 800 cavalry. They are bounded by the river Indus and surrounded by a ring of mountains and by deserts. Below the deserts at a distance of 625 miles are the Dan and Surae, and then desert again for a distance of 187 miles, these places for the most part being surrounded by sands exactly as islands are surrounded by the sea Below these deserts are the Maltaecorae Singae Moroae Rarungae and Moruni. These peoples are the inhabitants of the mountains that stretch in a continuous range on the coast of the ocean; they are free people having no kings, and they occupy the mountain slopes with a number of cities. Next come the Nareae, who are shut in by the Capitalia range, the highest of the mountains of India. The inhabitants of the other side of this mountain work a wide range of gold and silver mines. Next to these come the Oratae, whose king has only ten elephants but a large force of infantry, the Suaratarataethese also though ruled by a king do not keep elephants but rely on cavalry and infantrythe Odonbaeoraes and the Arabastrae, whose fine city Thorax is guarded .by marshy canals which crocodiles, creatures with an insatiable appetite for human flesh, render impassable save by way of a bridge. Another town in their country is also highly spoken of, Automula, which is situated on the coast at the point of confluence of five rivers, and has a celebrated market; their king possesses 1600 elephants, 150,000 foot and 5000 horse. The king of the Charmae is not so wealthy, having 60 elephants and small forces of the other kinds. The race next to these is that of the Pandae, the only people in India ruled by queens. They say that only one child of the female sex was born to Hercules, and that she was in consequence his favourite and he bestowed on her a specially large kingdom. The queens deriving their descent from her rule aver 300 towns, and have an army of 150,000 foot and 500 elephants. After this list of 300 cities we have the Derangae, Posingae, Butae, Gogaraei, Umbrae, Nereae, Brangosi, Nobundae, Cocondae, Nesei, Palatitae, Salobriasae and Orostrae, the last people being adjacent to the island of Patala, the distance from the extreme point of which to the Caspian Gates is given as 1925 miles.

From this point onward the tribes dwelling on the Indusour enumeration proceeding up streamare the Mathoae, Bolingae, Gallitalutae, Dimuri, Megan, Ardabae, Mesae, Abi, Sun and Silae; then 250 miles of desert; and after traversing that, the Organagae, Abortae and Bassuertae; and next to these an uninhabited stretch equal in extent to the preceding one. Then the Sorofages, Arbae and Marogomatrae; the Umbnitae and Ceae comprising twelve tribes and each race possessing two cities; the Asini inhabiting three cities, their chief place being Oxhead, founded to be the burial-place of King Alexander's charger bearing that name. Mountain tribes above these under the Hindu Kush range are the Sosaeadae and Sondrae; and crossing the Indus and following it downstream we come to the Samarabiae, Sarnbraceni, Bisambritae, Orsi and

Andiseni, and the Taxilae with their famous city. Then the region slopes down to level ground, the whole having the name of Amenda; and there are four tribes, the Peucolitae, Arsagalitae, Geretae and Assoi; indeed, most authorities do not put the western frontier at the river Indus but include four satrapies, the Gedjrosi, Arachotae, Arii and Paropanisidae, with the river Kabul as the final boundarythe whole of which region others consider to belong to the Arii. Moreover most people also assign to India the city of Nisa and Mount Merus which is sacred to Father Liber (this being the place from which originated the myth of the birth of Liber from the thigh of Jove), and the same as to the Aspagani tribe, a district producing the vine, the bay and the box and all the kinds of fruit indigenous to Greece. Remarkable and almost fabulous reports as to fertility of soil and variety of crops and trees or wild animals and birds and other living creatures will be recorded in their several places in the remainder of the work, and the four satrapies will be described a little below, as at present our mind hastens on to the island of Ceylon.

But before Ceylon come some other islands: Patale, which we have indicated as situated at the very mouth of the Indus, an island of triangular shape, 220 miles in breadth; and outside the mouth of the Indus Chryse and Argyre, both of which I believe to be rich in mineralsfor I find it hard to believe the statement of some writers that they only have gold and silver mines. Twenty miles beyond these is Crocala, and 12 miles further Bibaga, which is full of oysters and other shell-fish, and then Coralliba 8 miles beyond the abovementioned island, and many of no note.

24. Ceylon, under the name of the Land of the Counterlanders, was long considered to be another world; but the epoch and the achievements of Alexander the Great supplied clear proof of its being an island. Onesicritus, a commander of Alexander's navy, writes that elephants are bred there of larger size and more warlike spirit than in India; and Megasthenes says that it is cut in two by a river, that the inhabitants have the name of Aborigines, and that they produce more gold and large pearls than the Indians. Eratosthenes further gives the dimensions of the island as 875 miles in length and 625 miles in breadth, and says that it contains no cities, but 700 villages. Beginning at the eastern sea it stretches along the side of India from east to west; and it was formerly believed to be a distance of 20 days' sail from the nation of the Prasii, but at later times, inasmuch as the voyage to it used to be made with vessels constructed of reeds and with the rigging used on the Nile, its distance was fixed with reference to the speeds made by our ships as seven days' sail. The sea between the island and the mainland is shallow not more than 18 feet deep, but in certain channels so deep that no anchors hold the bottom: for this reason ships are used that have bows at each end, so as to avoid the necessity of coming about while negotiating the narrows of the channel; the tonnage of these vessels is as much as three thousand barrels.a The Cingalese take no observations of the stars in navigationindeed the Great Bear is not visible; but they carry birds on board with them and at fairly frequent intervals set them free, and follow the course they take as they make for the land. They only use four months in the year for voyages, and they particularly avoid the hundred days following midsummer, when those seas are stormy.

So far the facts stated have been recorded by the early We however have obtained more accurate writers. information during the principate of Claudius, when an embassy actually came to Rome from the island of Ceylon. The circumstances were as follows: Annius Plocamus had obtained a contract from the Treasury to collect the taxes from the Red Sea; a freedman of his while sailing round Arabia was carried by gales from the north beyond the coast of Carmania, and after a fortnight made the harbour of Hippuri in Cevlon. where he was entertained with kindly hospitality by the king, and in a period of six months acquired a thorough knowledge of the language; and afterwards in reply to the king's enquiries he gave him an account of the Romans and their emperor. The king among all that he heard was remarkably struck with admiration for Roman honesty, on the ground that among the money found on the captive the denarii were all equal in weight, although the various figures on them showed that they had been coined by several emperors. This strongly attracted his friendship, and he sent four envoys, the chief of whom was Rachias. From them we learnt the following facts about Ceylon: it contains 500 towns, and a harbour facing south, adjacent to the town of Palaesimundus, which is the most famous of all the places in the island and a royal residence, with a population of 200,000. Inland (we were told) there is a marsh named Megisba measuring 375 miles round and containing islands that only produce pasturage; and out of this marsh flow two rivers, Pahesirnundus running through three channels into the harbour near the town that bears the same name as the river and measuring over half a mile in breadth at the narrowest point and nearly two miles at the widest, and the other, named Cydara, flowing north in the direction of India. The nearest cape in India (according to our informants) is the one called Cape Comorin, at a distance of four days' sail, passing

in the middle of the voyage the Island of the Sun; and the sea there is of a deep green colour, and also has thickets of trees growing in it, the tops of which are brushed by the rudders of passing vessels. The envoys marvelled at the new aspect of the heavens visible in our country, with the Great and Little Bear and the Pleiades, and they told us that in their own country even the moon only appears above the horizon from the 8th to the 18th day of the month, and that Canopus, a large and brilliant star, lights them by night. But what surprised them most was that their shadows fell towards our sky and not towards theirs, and that the sun rose on the left-hand side of the observer and set towards the right instead of vice versa They also told us that the side of their island facing towards India is 1250 miles long and lies south-east of India; that beyond the Himalayas they also face towards the country of the Chinese, who are known to them by intercourse in trade as well, the father of Rachia having travelled there, and that when they arrived there the Chinese always hastened down to the beach to meet them. That people themselves (they told us) are of more than normal height, and have flaxen hair and blue eves, and they speak in harsh tones and use no language in dealing with travellers. The remainder of the envoys' account agreed with the reports of our tradersthat commodities were deposited on the opposite bank of a river by the side of the goods offered for sale by the natives, and they took them away if satisfied by the barterhatred of luxury being in no circumstances more justifiable than if the imagination travels to the Far East and reflects what is procured from there and what means of trade are employed and for what purpose.

But even Ceylon, although banished by Nature beyond the confines of the world, is not without the vices that belong to us: gold and silver are valued there also, and a kind of marble resembling tortoiseshell and pearls and precious stones are held in honour; in fact the whole mass of luxury is there carried to a far higher pitch than ours. They told us that there was greater wealth in their own country than in ours, but that we made more use of our riches: with them nobody kept a slave, everybody got up at sunrise and nobody took a siesta in the middle of the day; their buildings were of only moderate height; the price of corn was never inflated; there were no law-courts and no litigation; the deity worshipped was Hercules: the king was elected by the people on the grounds of age and gentleness of disposition, and as having no children, and if he afterwards had a child, he was deposed, to prevent the monarchy from becoming hereditary. Thirty Governors, they told us, were assigned to the king by the people, and capital punishment could only be inflicted by a vote of a majority of these; and even then there was a right of appeal to the people, and a jury of seventy members was appointed to try the case, and if these acquitted the accused the thirty Governors were no more held in any esteem, being utterly disgraced. The king's costume was of Father Liber, and the other people wore Arabian dress. If the king committed a delinquency he was punished by being condemned to death, though nobody executed the sentence, but the whole of the people turned their backs on him and refused to have any communication with him or even to speak to him. Holidays, they told us, were spent in hunting, tiger hunts and elephant hunts being always the most popular. Agriculture was industriously practised, but the vine was not grown, although orchard fruit was abundant. They were also fond of fishing, especially for turtle, the shells of which were used as roofs for family dwellingsthey were found of so large a size. They looked upon a hundred years as a moderate span of life.

This is the information that was given to us about Ceylon. 25. The following is the arrangement of the four satrapies which we deferred to this place in our account. After leaving the races nearest to India, you come to the mountain districts. That of Capisene formerly had a city named Capisa, which was destroyed by Cyrus: next Arachosia, with a river and town of the same namethe town, which was founded by Semiramis, being called by some writers Culls; then the river Erymandus, flowing past the Arachosian town of Parabeste. Next to the Arachosii writers place the Dexendrusi on the south side, adjoining a section of the Arachotae, and the Paropanisadae on the north: and beneath the Hindu Kush the town of Cartana, later called Tetragonis. This region is opposite to Bactria, and then comes the region of the Ariani, whose town is called Alexandria after its founder; the Syndraci, Dangalae, Parapinae, Cataces and Mazi; near the Hindu Kush the Cadrusi, whose town was founded by Alexander. Below these places the whole country is more level. In the direction of the Indus is the Arian region, which is scorched by glowing heat and encircled by deserts, yet extending in the district between them with plenty of shade, it is occupied by numerous farmers, settled especially on the banks of two rivers, the Tonberos and the Arosapes. There is a town, Artacoana, and a river, Anus, which flows past Alexandria, a town founded by Alexander which covers an area of nearly four miles: and the much more beautiful as well as older town of Artacabene, the fortifications of which were renewed by Antiochus, covers an area of 6 miles. Then the Dorisdorsigi tribe; the rivers Pharnacotis and Ophradus; Prophthasia; the town of Zaraspadum, the Drangae, Euergetae, Zarangae and Gedrusi; the towns of Peucolis, Lyphorta and Methorcum; a space of desert: the river Manain, the Acutri tribe, the river Loins, the Orbi tribe, the navigable river Pomanus at the frontier of the Pandae and the Cabirus at that of the Suari, forming a good harbour at its mouth; the town of Condigramma and the river Kabul. Navigable tributaries of the Kabul are the Saddaros, Parospus and Sodamus. Some hold that Daritis is part of Ariana, and they give the dimensions of both aslength 1950 miles, breadth one half that of India. Others place the Gedrusi and Sires as covering an area of 138 miles, and then the Fisheating Oritae, who do not speak the Indian language but have one of their own, covering a space of 200 miles. (Alexander made an order forbidding a fish diet to all the Fish-eaters.) Next they put the race of the Arbii, covering 200 miles. Beyond them there is a region of desert, and then come Carmania, Farsistan and Arabia.

26. But before we go on to a detailed account of these countries, it is suitable to indicate the facts reported by Onesicritus after sailing with the fleet of Alexander round from India to the interior of Farsistan, and quite recently related in detail by Juba, and then to state the sea-route that has been ascertained in recent times and is followed at the present day.

The record of the voyage of Onesicritus and Nearchus does not include the names of the official stopping places nor the distances travelled; and to begin with, no sufficiently clear account is given of the position of the city of Timbertown, founded by Alexander, which was their starting point, nor is the river on which it stood indicated. Nevertheless they give the following places worth mentioning: the town of Arbis, founded by Nearchus during his voyage, and the river Arbium, navigable by ships, and an island opposite to Arbis, 8 miles distant; Alexandria, founded in the territory of this race by Leonnatus at the order of Alexander; Argenus, with a serviceable harbour; the navigable river Tonberum, in the neighbourhood of which are the Parirae; then the Fish-eaters, covering so wide a space of coast that it took 30 days to sail past them; the island a called the Isle of the Sun and also the Couch of the Nymphs, the soil of which is red in colour, and on which all animals without exception die, from causes not ascertained; the On tribe; .the Carmanian river Hyctanis, affording harbourage and producing gold. The travellers noted that it was here that the Great and Little Bear first became visible, and that Arcturus is not visible at all on some nights and never all night long; that the rule of the Persian kings extended to this point; and that copper, iron, arsenic and red-lead are mined here. Next there is the Cape of Carmania, from which it is a passage of five miles to cross to the Arabian tribe of the Macae on the opposite coast; three islands, of which only Oracta, 25 miles from the mainland, has a supply of fresh water and is inhabited; four islands quite in the gulf, off the coast of Farsistanin the neighbourhood of these the fleet was terrified by sea-serpents 30 ft. long that swam alongside the island of Aradus and that of Gauratae, both inhabited by the Gyani tribe; at the middle of the Persian Gulf the river Hyperis, navigable for merchant vessels; the river Sitioganus, up which it is seven days' voyage to Pasargadae; the navigable river Phrystimus; and an island that has no name. The river Granis, carrying vessels of moderate size, flows through Susiane, and on its right bank dwell the Dedmontani, who manufacture asphalt; the river Zarotis, the mouth of which is difficult to navigate except for those familiar with it; and two small islands. Then comes a shallow stretch of water like a marsh which nevertheless is navigable by way of certain channels; the mouth of the Euphrates; a lake formed in the neighbourhood of Charax by the Eulaeus and the Tigris; then by the Tigris they reached Susa. There after three months' voyaging they found Alexander celebrating a festival; it was seven months since he had left them at Patala. Such was the route followed by the fleet of Alexander; but subsequently it was thought that the safest line is to start from Ras Fartak in Arabia with a west wind (the native name for which in those parts is Hippalus) and make for Patale, the distance being reckoned as 1332 miles. The following period considered it a shorter and safer route to start from the same cape and steer for the Indian harbour of Sigerus, and for a long time this was the course followed, until a merchant discovered a shorter route, and the desire for gain brought India nearer; indeed, the voyage is made every year, with companies of archers on board, because these seas used to be very greatly infested by pirates.

And it will not be amiss to set out the whole of the voyage from Egypt, now that reliable knowledge of it is for the first time accessible. It is an important subject, in view of the fact that in no year does India absorb less than fifty million sesterces of our empire's wealth, sending back merchandise to be sold with us at a hundred times its prime cost. Two miles from Alexandria is the town of Juliopolis. The voyage up the Nile from there to Keft is 309 miles, and takes 12 days when the midsummer trade-winds are blowing. From Keft the journey is made with camels, stations being placed at intervals for the purpose of watering; the first, a stage of 22 miles, is called Hydreuma; the second is in the mountains, a day's journey on; the third at a second place named Hydreuma, 85

Apollo's Hydreuma, 184 miles from Keft; again a station in the mountains; then we get to New Hydreuma, 230 miles from Keft. There is also another old Hydreuma known by the name of Trogodyticum, where a guard is stationed on outpost duty at a caravanserai accommodating two thousand travellers; it is seven miles from New Hydreuma. Then comes the town of Berenice, where there is a harbour on the Red Sea, 257 miles from Keft. But as the greater part of the journey is done by night because of the heat and the days are spent at stations, the whole journey from Keft to Berenice takes twelve days. Travelling by sea begins at midsummer before the dog-star rises or immediately after its rising, and it takes about thirty days to reach the Arabian port of Cella or Cane in the frankincense-producing district. There is also a third port named Mokha, which is riot called at on the voyage to India, and is only used by merchants trading in frankincense and Arabian perfumes. Inland there is a town, the residence of the king of the district, called Sapphar, and another called Save. But the most advantageous way of sailing to India is to set out from Celia; from that port it is a 40 days' voyage, if the Hippalus is blowing, to the first trading-station in India, Cranganorenot a desirable port of call, on account of the neighbouring pirates, who occupy a place called Nitriae, nor is it specially rich in articles of merchandise; and furthermore the roadstead for shipping is a long way from the land, and cargoes have to be brought in and carried out in boats. The king of Muziris, at the date of publication, was Caelobothras. There is another more serviceable port, belonging to the Neacyndi tribe, called Porakad; this is where king Pandion reigned, his capital being a town in the interior a long way from the port, called Madura; while the district from which pepper is conveyed to Becare in canoes made of hollowed treetrunks is called Cottonara. But all these names of tribes and ports or towns are to be found in none of the previous writers. which seems to show that the local conditions of the places are changing. Travellers set sail from India on the return voyage at the beginning of the Egyptian month Tybis, which is our December, or at all events before the sixth day of the Egyptian Mechir, which works out at before January 13 in our calendarso making it possible to return home in the same year. They set sail from India with a southeast wind, and after entering the Red Sea, continue the voyage with a south-west or south wind.

miles from Keft: the next is in the mountains: next we come to

We will now return to our main subject.

27. Nearchus writes that the length of the coast of Carmania is 1250 miles, and the distance from its beginning to the river Sabis 100 miles; and that from that river to the river Ananis, a space of 25 miles, there are vineyards and arable land. The district is called Armysia; and towns of Carmania are Zetis and Alexandria.

28. Moreover in this region the sea then makes a double inroad into the land; the name given to it by our countrymen is the Red Sea, while the Greeks call it Erythrum, from King Ervthras, or, according to others, in the belief that the water is given a red colour by the reflexion of the sun, while others say that the name comes from the sand and the soil, and others that it is due to the actual water being naturally of such a character. However, this sea is divided into two bays. The one to the east. is called the Persian Gulf, and according to the report of Eratosthenes measures 2500 miles round. Opposite is Arabia, with a coastline 1500 miles in length, and on its other side Arabia is encompassed by the second bay, named the Arabian Gulf; the ocean flowing into this is called the Azaman Sea. The width of the Persian Gulf at its entrance some make five and others four miles; the distance in a straight line from the entrance to the innermost part of the Gulf has been ascertained to be nearly 1125 miles, and its outline has been found to be in the likeness of a human head. Onesicritus and Nearchus write that from the river Indus to the Persian Gulf and from there to Babylon by the marshes of the Euphrates is a voyage of 1700 miles. In an angle of Carmania are the Turtle-eaters, who roof their houses with the shells and live on the flesh of turtles. These people inhabit the promontory that is reached next after leaving the river Arabis. They are covered all over, except their heads, with shaggy hair, and they wear clothes made of the skins of fishes. After the district belonging to these people, in the direction of India there is said to be an uninhabited island, Cascandrus, 50 miles out at sea, and next to it, with, a strait flowing between, Stoidis, with a valuable pearl-fishery. After the promontory the Carmanians are adjoined by the Harmozaei, though some authorities place the Arbii between them, stretching all along the coast for 421 miles. Here are the Port of the Macedonians and the Altars of Alexander situated on a promontory; the rivers are Siccanas and then the Dratinus and the Salsum. After the Salsum is Cape Themisteas, and the inhabited island of Aphrodisias. Here is the beginning of Farsistan, at the river Tab which separates Farsistan from Elymais. Off the coast of Farsistan lie the islands of Psilos, Cassandra and Aracha, the last with an extremely lofty mountain, and consecrated to Neptune. Farsistan itself occupies 550 miles of coast, facing west. It is wealthy even to the point of luxury. It has long ago changed its name to Parthia.

We will now give a brief account of the Parthian empire.

29. The Parthi possess in all eighteen kingdoms, such being the divisions of their provinces on the coasts of two seas, as we have stated, the Red Sea on the south and the Caspian Sea on the north. Of these provinces the eleven designated the Upper Kingdoms begin at the frontiers of Armenia and the shores of the Caspian, and extend to the Scythians, with whom the Parthiars live on terms of equality. The remaining seven kingdoms are called the Lower Kingdoms. So far as the Parthi are concerned, there has always been a country named Parthyaea at the foot of the mountain range, already mentioned more than once, which forms the boundary of all these races. To the east of Parthyaea are the Arii, to the south Carmania and the Ariani, to the west the Pratitae, a Median race, and to the north the Hyrcani: and it is surrounded on all sides by desert. The more remote Parthians are called the Nomads. Short of the desert on the west side are the Parthian cities mentioned above, Issatis and Calliope; north-east is Pyropum, south-east Maria, and in the middle Hecatompylos, Arsace, and the fine district of Parthyene, Nisiaea, containing the city named Alexandropolis after its founder.

At this point it is necessary also to indicate the geographical position of the Medes, and to trace the formation of the country round to the Persian Sea, in order that the rest of the account that follows may be more easily understood. Media lies crosswise on the west side, meeting Parthia at an angle, and so shutting off both groups of Parthian kingdoms. Consequently it has the Caspian and Parthian people on its east side, Sittacene, Susiane and Farsistan on the south, Adiabene on the west, and Armenia on the north. The Persians have always lived on the shore of the Red Sea, which is the reason why it is called the Persian Gulf. The coastal region there is called Cyropolis, but the Greek name of the place where it runs up towards the Medes is the Great Staircase, from a steep gorge ascending the mountain by stages, with a narrow entrance, leading to the former capital of the kingdom, Persepolis, which was destroyed by Alexander. Right on the frontier the region also possesses the city of Laodicea, founded by Antiochus. To the east of Laodicea is the fortress of Phrasargis, occupied by the Magi, which contains the tomb of Cyrus; and another place belonging to the Magi is the town of Ecbatana which King Darius transferred to the mountains. Between the Parthi and the Ariani projects the territory of the Paraetaceni. The Lower Kingdoms are enclosed by these races and by the Euphrates; of the remaining kingdoms we shall speak after describing Mesopotamia, with the exception of the point of that country and the Arabian peoples mentioned in the preceding volume.

30. The whole of Mesopotamia once belonged to the Assyrians, and the population was scattered in villages, with the exception of Babylon and Nineveh. The Macedonians collected its population into cities, because of the fertility of the soil. Besides the cities already mentioned it has the towns of Seleucia Laodicea and Artemita: and also in the territory of the Arabian tribe called the Orroei and Mandani, Antioch. which was founded by Nicanor when Governor of Mesopotamia, and which is called Arabian Antioch. Adjoining these, in the interior, are the Arabian tribe of the Eldamari, above whom on the river Pallaconta is the town of Buura, and the Arabian Salmani and Masei: but adjoining the Guxdiaei are the Azoni, through whose country flows the Zerbis, a tributary of the Tigris, and adjoining the Azoni the mountain tribe of the Silices and the Orontes; west of whom is the town of Gaugamela, and also Suae on a cliff. Above the Silices are the Sitrae, through whom flows the Lycus from its source in Armenia, and south-east of the Sitrae the town of Azochis, and then in level country the towns of Zeus's Spring, Polytelia, Stratonicea and Anthemus, In the neighbourhood of the Euphrates is Nicephorion, mentioned above; it was founded by order of Alexander because of the convenience of the site. We have also mentioned Apamea opposite Bridgetown; travelling eastward from which one comes to the fortified town of Caphrena, which formerly measured 8 miles in extent and was called the Court of the Satraps, being a centre for the collection of tribute, but which has now been reduced to a fortress. Thebata remains in the same condition as it was formerly, and so does the place which marked the limit of the Roman Empire under the leadership of Pompey, Oruros, 250 miles from Bridgetown. Some writers record that the Euphrates was diverted into an artificial channel by the governor Gobares at the place where we have stated that it divides, in order to prevent the violence of its current from threatening damage to the district of Babylonia; and that its name among the whole of the Assyrians is Narmalchas, which means the Royal River. At the point where the channel divides there was once a very large town named Agranis, which was destroyed by the Persians.

Babylon, which is the capital of the Chaldaean races, long held an outstanding celebrity among the cities in the whole of the world, and in consequence of this the remaining part of Mesopotamia and Assyria has received the name of Babylonia. It has two walls with a circuit of 60 miles, each wall being 200 ft. high and 50 ft. wide (the Assyrian foot measures 3 inches more than ours). The Euphrates flows through the city, with marvellous embankments on either side. The temple of Jupiter Belus in Babylon is still standingBelus was the discoverer of the science of astronomy; but in all other respects the place has gone back to a desert, having been drained of its population by the proximity of Seleucia, founded for that purpose by Nicator not quite 90 miles away, at the point where the canalised Euphrates joins the Tigris. However, Seleucia is still described as being in the territory of Babylon, although at the present day it is a free and independent city and retains the Macedoman manners. It is said that the population of the city numbers 600,000; that the plan of the walls resembles the shape of an eagle spreading its wings; and that its territory is the most fertile in the whole of the east. For the purpose of drawing away the population of Seleucia in its turn, the Parthians founded Ctesiphon, which is about three miles from Seleucia in the Chalonitis district, and is now the capital of the kingdoms of Parthia. And after it was found that the intended purpose was not being achieved, another town was recently founded in the neighbourhood by King Vologesus, named Vologesocerta. There are in addition the following towns in Mesopotamia: Hipparenithis also a school of Chaldaean learning like Babylonsituated on a tributary of the river Narraga, from which the city-state takes its name (the walls of Hippareni were demolished by the Persians); also Orcheni, a third seat of Chaldaean learning, is situated in the same neighbourhood towards the south: and next Notitae and Orothophanitae and Gnesiochartae.

Nearchus and Onesicritus report that the Euphrates is navigable from the Persian Sea to Babylon, a distance of 412 miles; but subsequent writers say it is navigable up to Seleucia, 440 miles, and Juba from Babylon as far as Charax, 175 miles. Some report that it continues to flow in a single channel for a distance of 87 miles beyond Babylon before it is diverted into irrigation-channels, and that its entire course is 1200 miles long. This discrepancy of measurement is due to the variety of authors that have dealt with the matter, as even among the Persians different writers give different measurements for the length of the sochoenus and the parasang. Where it ceases to afford protection by its channel, as it does when its course approaches the boundary of Charax, it immediately begins to be infested by the Attali, an Arabian tribe of brigands, beyond whom are the Scenitae. But the winding course of the Euphrates is occupied by the Nomads of Arabia right on to the desert of Syria, where, as we have stated, the river makes a bend to the south, quitting the uninhabited districts of Palmyra. The distance of Seleucia from the beginning of Mesopotamia is a voyage by the Euphrates of 1125 miles; its distance from the Red Sea, if the voyage by made by the Tigris, is 320 miles, and from Bridgetown 724 miles. Bridgetown is 175 miles from Seleucia on the Mediterranean coast of Syria. This gives the breadth of the country lying between the Mediterranean and the Red Sea. The extent of the kingdom of Parthia is 918 miles

31. Moreover there is a town belonging to Mesopotamia on the bank of the Tigris near its confluence with the Euphrates, the name of which is Digba. But some statement about the Tigris itself may also be suitable here. The source of the Tigris is in a region of Greater Armenia, and is clearly visible, being on level ground; the name of the place is Elegosine, and the stream itself in its comparatively sluggish part is named Diglitus, but where its flow accelerates, it begins to be called the Tigris, owing to its swiftnesstigris is the Persian word for an arrow. It flows into Lake Aretissa, heavy objects thrown into which always float on the surface, and which gives off nitrous vapours. The lake contains a single species of fish, which never enters the current of the Tigris flowing through the lake, as likewise the fish of the river do not swim out of its stream into the water of the lake; but the river travels on in a distinct course and with a different colour, and when after traversing the lake it comes against Mount Taurus, it plunges into a cave, glides underground, and bursts out again on the other side of the mountain. The name of the place where it emerges is Zoaranda; and the identity of the stream is proved by the fact that objects thrown into it are carried through the tunnel. Then it crosses a second lake called Thespites, and again burrows into underground passages, re-emerging 22 miles further on in the neighbourhood of Nymphaeum. According to Claudius Caesar, the course of the Tigris in the Archene district is so close to that of the Arsanias that when they are in flood they flow together, although without intermingling their waters: that of the Arsanias being of less specific gravity floats on the surface for a distance of nearly four miles, after which the two rivers separate, and the Arsanias discharges into the Euphrates. The Tigris however after receiving as tributaries from Armenia those notable rivers the Parthenias and Nicephorion, makes a frontier between the Arab tribes of the Orroei and Adiabeni and forms the region of Mesopotamia mentioned above: it then traverses the mountains of the Gurdiaei, flowing round Apamea, a town belonging to Mesene, and 125 miles short of Babylonian Seleucia splits into two channels, one of which flows south and reaches Seleucia, watering Mesene on the way, while the other bends northward and passing behind the same people cuts through the plains of Cauchae; when the two streams have reunited, the river is called Pasitigris. Afterwards it is joined by the Kerkhah from Media, and, as we have said, after flowing between Seleucia and Ctesiphon empties itself into the Chaldaean Lakes, and broadens them out to a width of 62 miles. Then it flows out of the Lakes in a vast channel and passing on the right-hand side of the town of Charax discharges into the Persian Sea, the mouth of the river being 10 miles wide. The mouths of the two rivers used to be 25 miles apart, or as others record 7 miles, and both were navigable; but a long time ago the Euphrates was dammed by the Orcheni and other neighbouring tribes in order to irrigate their lands, and its water is only discharged into the sea by way of the Tigris.

The country adjacent to the Tigris is called Parapotamia. It contains the district of Mesene, mentioned above; a town in this is Dabitha, and adjoining it is Chalonitis, with the town of Ctesiphon, a wooded district containing not only palm groves but also olives and orchards. Mount Zagrus extends as far as Chalonitis from Armenia, coming between the Medes and the Adiabeni above Paraetacene and Farsistan. The distance of Chalonitis from Farsistan is 380 miles, and some persons say that by the shortest route it is the same distance from the Caspian Sea and from Syria. Between these races and Mesene is Sittacene, which is also called Arbelitis and Palaestine. Its town of Sittace is of Greek origin, and also to the east of this is Sabdata and to the west Antiochia, which lies between the two rivers, Tigris and Tomadotus, and also Apamea, which Antiochus named after his mother: this town is surrounded by the Tigris, and the Archous intersects it. Below is Susiane, in which is situated Susa, the ancient capital of the Persian monarchy, founded by Darius son of Hystaspes. Babylonia is 450 miles from Seleucia, and the same distance from Ecbatana of the Medes, by way of Mount Carbantus. On the northern channel of the Tigris is the town of Barbitace, which is 135 miles from Susa. Here are the only people among mankind who have a hatred for gold, which they collect together and bury, to prevent anyone from using it. Adjoining the Susiani on the east are the brigand Oxii and the forty in dependent and savage tribes of the Mizaei. Above these and subject to the Parthians are the Mardi and Saitae stretching above Blymais, which we described as adjacent to Farsistan on the coast. The distance of Susa from the Persian Gulf is 250 miles. Near where the fleet of Alexander came up the Pasitigris to the city of Susa is a village on the Chaldaic lake called Aple, the distance of which from Susa is a voyage of 62 miles. The nearest people to the Susiani on the east side are the Cossiaei and beyond the Cossiaei to the north is Massabatene, lving below Mount Cambalidus, which is a spur of the Caucasus range; from this point is the easiest route across to the country of the Bactri.

The territory of Susa is separated from Elymais Swsa by the river Karn, which rises in the country of the Medes, and after running for a moderate distance underground, comes to the surface again and flows through Massabatene. It passes round the citadel of Susa and the temple of Diana, which is regarded with the greatest reverence by the races in those parts; and the river itself is held in great veneration, inasmuch as the kings drink water drawn from it only, and consequently have it conveyed to places a long distance away. Tributaries of the Karn are the Hedyphos, which flows past the Persian town of Asylum, and the Aduna coming from the territory of the Susiani. On the Karn lies the town of Magoa, 15 miles from Charaxthough some people locate Magoa at the extreme edge of the territory of Susa, close to the desert. Below the Kardu on the coast is Elymais, which marches with Farsistan and extends from the river Oratis to the Charax, a distance of 240 miles; its towns are Seleucia and Sostrate, situated on the flank of Mount Chasirus. The coast lying in front, as we have stated above, is rendered inaccessible by mud, like the Lesser Syrtes, as the rivers Brixa and Ortacia bring down a quantity of sediment, and the Elymais district is itself so marshy that it is only possible to reach Farsistan by making a long detour round it. It is also infested with snakes carried down by the streams. A particularly inaccessible part of it is called Characene, from Charax, a town of Arabia that marks the frontier of these kingdoms; about this town we will now speak, after first stating the opinion of Marcus Agrippa. According to his account the countries of Media, Parthia and Farsistan are bounded on the east by the Indus, on the west by the Tigris, on the north by the Taurus and Caucasus mountains, and on the south by the Red Sea, and cover an area 1320 miles in length and 840 miles in breadth; he adds that the area of Mesopotamia by itself, bounded by the Tigris on the east, the Euphrates on the west, Mount Taurus on the north and the Persian Sea on the south, is 800 miles in length by 360 miles in breadth.

The town of Charax is situated in the innermost recess of the Persian Gulf, from which projects the country called Arabia Felix. It stands on an artificial elevation between the Tigris on the right and the Karn on the left, at the point where these two rivers unite, and the site measures two miles in breadth. The original town was founded by Alexander the Great with settlers brought from the royal city of Durine, which was then destroyed, and with the invalided soldiers from his army who were left there. He had given orders that it was to be called Alexandria, and a borough which he had assigned specially to the Macedonians was to be named Pellaeum, after the place where he was born. The original town was destroyed by the rivers, but it was afterwards restored by Antiochus, the fifth king of Syria, who gave it his own name; and when it had been again damaged it was restored and named after himself by Spaosines son of Sagdodonacus, king of the neighbouring Arabs, who is wrongly stated by Juba to have been a satrap of Antiochus; he constructed embankments for the protection of the town, and raised the level of the adjacent ground over a space of six miles in length and a little less in breadth. It was origin ally at a distance of 1 miles from the coast, and had a harbour of its own, but when Juba published his work it was 50 miles inland; its present distance from the coast is stated by Arab envoys and our own traders who have come from the place to be 120 miles. There is no part of the world where earth carried down by rivers has encroached on the sea further or more rapidly; and what is more surprising is that the deposits have not been driven back by the tide, as it approaches far beyond this point.

It has not escaped my notice that Charax was the birthplace of Dionysius, the most recent writer dealing with the geography of the world, who was sent in advance to the East by his late majesty Augustus to write a full account of it when the emperor's elder son was about to proceed to Armenia to take command against the Parthians and Arabians; nor have I forgotten the view stated at the beginning of my work that each author appears to be most accurate in describing his own country; in this section however my intention is to be guided by the Roman armies and by King Juba, in his volumes dedicated to the above-mentioned Gaius Caesar describing the same expedition to Arabia.

32. In regard to the extent of its territory Arabia is inferior to no race in the world: its longest dimension is, as we have said, the slope down from Mount Amanus in the direction of Cilicia and Commagene, many of the Arabian races having been brought to that country by Tigranes the Great, while others have migrated of their own accord to the Mediterranean and the Egyptian coast, as we have explained, and also the Nubei penetrating to the middle of Syria as far as Mount Lebanon adjoining whom are the Ramisi and then the Teranei and then the Patami. Arabia itself however is a peninsula projecting between two seas, the Red Sea and the Persian Gulf, some device of nature having surrounded it by sea with a conformation and an area resembling Italy, and also with exactly the same orientation so that it also has the advantage of that geographical position. We have stated the peoples that inhabit it from the Mediterranean to the deserts of Palmyra, and we will now recount the remainder of them from that point onward.

Bordering on the Nomads and the tribes that harry the territories of the Chaldaeans are, as we have said, the Scenitae, themselves also a wandering people, but taking their name from their tents made of goat's-hair cloth, which they pitch wherever they fancy. Next are the Nabataeans inhabiting a town named Petra; it lies in a deep valley a little less than two miles wide, and is surrounded by inaccessible mountains with a river flowing between them. Its distance from the town of Gaza on the Mediterranean coast is 600 miles, and from the Persian Gulf 635 miles. At Petra two roads meet, one leading from Syria to Palmyra, and the other coming from Gaza. After Petra the country as far as Charax was inhabited by the Omani, with the once famous towns of Abaesamis and Soractia, founded by Semiramis; but now it is a desert. Then there is a town on the bank of the Pasitigris named Forat, subject to the King of the Characeni; this is resorted to by people from Petra, who make the journey from there to Charax, a distance of 12 miles by water, using the tide. But those travelling by water from the kingdom of Parthia come to the village of Teredon below the confluence of the Euphrates and the Tigris; the teft bank of the river is occupied by the Chaldaeans and the right bank by the Scenitae tribe of nomads. Some report that two other towns at long distances apart are also passed on the voyage down the Tigris. Barbatia and then Dumatha, the latter said to be ten days' voyage from Petra. Our merchants say that the king of the Characeni also rules over Apamea, a town situated at the confluence of the overflow of the Euphrates with the Tigris; and that consequently when the Parthians threaten an invasion they are prevented by the construction of dams across the river. which cause the country to be flooded.

We will now describe the coast from Charax onward, which was first explored for King Epiphanes. There is the place where the mouth of the Euphrates formerly was, a salt-water stream; Cape Caldone; an estuary more resembling a whirlpool than open sea, stretching 50 miles along the coast; the river Achenum; 100 miles of desert, extending as far as lcarus Island; Capeus Bay, on which dwell the Gaulopes and the Gattaei; the Bay of Gerra and the town of that name, which measures five miles round and has towers made of squared blocks of salt. Fifty miles inland is the Attene district; and opposite to it and the same number of miles distant from

the coast is the island of Tyros, extremely famous for its numerous pearls, with a town of the same name, and next another smaller island 12 miles away from the cape of Tyros. It is reported that beyond Tyros some large islands are in view which have never been visited; that the circumference of Tyros measures 112 miles: that its distance from Farsistan is more than that; and that it is accessible only by one narrow channel. Then the island of Ascliae, tribes named Nochaeti, Zurazi, Borgodi and the nomad Cathanei, and the river Cynos. According to Juba the voyage beyond on that side has not been explored, because of the rocksJuba omits to mention Batrasavave, the town of the Omani, and the town of Omana which previous writers have made out to be a famous port of Carmania, and also Homna and Attana, towns said by our traders to be now the most frequented ports in the Persian Gulf, After the Dog's River, according to Juba, there is a mountain looking as if it had been burnt; the Epimaranitae tribes, then the Fish-eaters, an uninhabited island, the Bathyxni tribes, the Eblythaean Mountains, the island of Omoemns, Port Mochorhae, the islands of Etaxalos and Inchobrichae, the Cadaei tribe: a number of islands without names, and the well-known islands of Isura and Rhinnea, and the adjacent island on which there are some stone pillars bearing inscriptions written in an unknown alphabet;. Port Coboea, the unhabited Bragae islands, the Taludaei tribe, the Dabanegoris district, Mount Orsa with its harbour, Duatas Bay, a number of islands, Mount Three Peaks, the Chardaleon district, the Solonades and Cachinna, also islands belonging to the Fish-eaters. Then Clan, the Mamaean coast with its gold-mines, the Canauna district, the Apitami and Casani tribes, Devade Island, the spring Coralis, the Carphati, the islands of Alaea and Amnamethus, the Darae tribe; Chelonitis Island and a number of islands of the Fish-eaters, the uninhabited Odanda, Basa, a number of islands belonging to the Sabaei. The dvers Thanar and Amnum, the Ilbric Islands. the Daulotos and Dora springs, the islands of Pteros, Labatanis, Coboris and Sambrachate with the town of the same name on the mainland. Many islands to the southward, the largest of which is Camari, the river Musecros, Port Laupas; the Sabaei, a tribe of Scenitae, owning many islands and a trading-station at Kalhat which is a port of embarkation for India; the district of Amithoscatta., Damnia, the Greater and Lesser Mizi, Drymatina, the Macae; a cape in their territory points towards Carmania, 50 miles away. A remarkable event is said to have occurred there: the governor of Mesene appointed by King Antiochus, Numenius, here won a battle against the Persians with his fleet and after the tide had gone out a second battle with his cavalry and set up a couple of trophies, to Jupiter and to Neptune, on the same spot.

Out at sea off this coast lies the island of Ogyris, famous as the burial-place of King Erythras; its distance from the mainland is 125 miles and it measures 112 miles round. Equally famous is a second island in the Azanian Sea, the island of Socotra, lying 280 miles away from the extreme point of Cape Syagrus.

The remaining tribes on the mainland situated further south are the Autaridae, seven days' journey into the mountains, the Larendani and Catapani tribe, the Gebbanitae with several towns, of which the largest are Nagia and Thomna, the latter with sixty-five temples, a fact that indicates its size. Then a cape the distance between which and the mainland in the Cave-dwellers' territory is 50 miles; then the Thoani, the Actaei, the Chatramotitae, the Tonabaei, the Antiadalei and Lexianae, the Agraei, the Cerbani and the Sabaei, the best known of all the Arabian tribes because of their frankincensethese tribes extend from sea to sea. Their towns on the coast of the Red Sea are Merme, Marina, Corolla, Sabbatha, and the inland towns are Nascus, Cardava, Carnus, and Thomala to which they bring down their perfumes for export. One division of them are the Atrainitae, whose chief place is Sabota, a walled town containing sixty temples; the royal capital of all these tribes however is Mareiabata, which lies on a bay measuring 94 miles round, studded with islands that produce perfumes. Adjoining the Atramitae in the interior are the Minaei; and dwelling on the coast are also the Aelamitae with a town of the same name, and adjoining them the Chaculatae with the town of Sibis, the Greek name of which is Apate, the Arsi, the Codani, the Vadaei with the large town of Barasasa, and the Lechieni; and the island of Sygaros, into which dogs are not admitted, and so being exposed on the seashore they wander about till they die. Then a bay running far inland on which live the Laeanitae, who have given it their name. Their capital is Agra, and on the bay is Laeana, or as others call it Aelana; for the name of the bay itself has been written by our people 'Laeanitic', and by others 'Aelanitic', while Artemidorus gives it as 'Alaenitic' and Juba as 'Leanitic'. The circumference of Arabia from Charax to Laeana is said to amount to 4665 miles, though Juba thinks it is a little less than 4000 miles; it is widest at the north, between the towns of Heroeum and Charax.

The rest of its inland places also must now be stated. Adjoining the Nabataei the old authorities put the Timanei, but now there are the Taveni, Suelleni, Araceni, Arreni (with a town which is a centre for all mercantile business), Hemnatae, Avalitae (with the towns of Domata and Haegra). Tamudaei (town Baclanaza), Cariati, Acitoali (town Phoda), and the Minaei, who derive their origin, as they believe, from King Minos of Crete; part of them are the Carmei. Fourteen miles further is the town of Maribba, then Paramalacun, also a considerable place, and Canon, to which the same applies. Then the Rhadamaei (these also are believed to descend from Rhadamanthus the brother of Minos), the Homeritae with the town of Mesala, the Hamiroei, Gedranitae, Phryaei, Lysanitae, Bachylitae, Samnaei, the Amaitaei with the towns of Messa and Chenneseris, the Zamareni with the towns of Sagiatta and Canthace, the Bacaschami with the town of Riphearina (a name which is the native word for barley), the Autaei, Ethravi, Cyrei with the town of Elmataei, Chodae with the town of Aiathuris 25 miles up in the mountains (in which is the spring called Aenuscabales, which means 'the fountain of the camels'), the town of Ampelome, a colony from Miletus, the town of Athrida, the Calingi, whose town is named Mariba, meaning 'lords of all men', the towns of Pallon and Murannimal, on a river through which the Euphrates is believed to discharge itself, the Agraei and Ammoni tribes, a town named Athenae, the Caunaravi (which means 'very rich in herds'); the Chorranitae, the Cesani and the Choani. Here were also the Greek towns of Arethusa, Larisa and Chalcis, but they have been destroyed in various wars

Aelius Gallus, a member of the Order of Knights, is the only person who has hitherto carried the arms of Rome into this country; for Gaius Caesar son of Augustus only had a glimpse of Arabia. Gallus destroyed the following towns not named by the authors who have written previouslyNegrana, Nestus, Nesca, Magusus, Caminacus, Labaetia; as well as Mariba above mentioned, which measures 6 miles round, and also Caripeta, which was the farthest point he reached. The other discoveries that he reported on his return are: that the Nomads live on milk and the flesh of wild animals; that the rest of the tribes extract wine out of palm trees, as the natives do in India, and get oil from sesame; that the Homeritae are the most numerous tribe; that the Minaei have land that is fertile in palm groves and timber, and wealth in flocks; that, the Cerbani and Agraei, and especially the Chatramotitae, excel as warriors; that the Carrei have the most extensive and most fertile agricultural land; that the Sabaei are the most wealthy, owing to the fertility of their forests in producing scents, their gold mines, their irrigated agricultural land and their production of honey and wax: of their scents we shall speak in [Book 12] the volume dealing with that subject. The Arabs wear turbans or else go with their hair unshorn: they shave their beards but wear a moustacheothers however leave the beard also unshaven. And strange to say, of these innumerable tribes an equal part are engaged in trade or live by brigandage; taken as a whole, they are the richest races in the world, because vast wealth from Rome and Parthia accumulates in their hands, as they sell the produce they obtain from the sea or their forests and buy nothing in return.

33. We will now follow along the rest of the coast lying opposite to Arabia. Timosthenes estimated the length of the whole gulf at four days' sail, the breadth at two, and the width of the Straits of Bab-el-Mandeb as 74 miles; Eratosthenes makes the length of the coast on either side from the mouth of the gulf 1200 miles; Artemidorus gives the length of the coast on the Arabian side as 1750 miles and on the side of the Cave-dweller country as far as Ptolemais 11844 miles; Agrippa says that there is no difference between the two sides, and gives the length of each as 1732 miles. Most authorities give the breadth as 475 miles, and the mouth of the gulf facing south-west some make 4 miles wide, others 7

The lie of the land is as follows: on leaving the Laeanitic Gulf there is another gulf the Arabic name of which is Aeas, on which is the town of Heroim. Formerly there was also the City of Cambyses, between the Neli and the Marchades; this was the place where the invalids from the army of Cambyses were settled. Then come the Tyro tribe and the Harbour of the Daneoi, from which there was a project to carry a ship-canal through to the Nile at the place where it flows into what is called the Delta, over a space of 62 miles, which is the distance between the river and the Red Sea; this project was originally conceived by Sesostris King of Egypt, and later by the Persian King Darius and then again by Ptolemy the Second, who did actually carry a trench 100 ft, broad and 30 ft, deep for a distance of 344 miles, as far as the Bitter Springs. He was deterred from carrying it further by fear of causing a flood, as it was ascertained that the level of the Red Sea is 44 ft. above that of the land of Egypt. Some persons do not adduce this reason for the abandonment of the project, but say that it was due to fear lest making an inlet from the sea would pollute the water of the Nile, which affords to Egypt its only supply of drinking-water. Nevertheless the whole journey from the Egyptian Sea is constantly performed by land, there being three routes: one from Pelusium across the sands, a route on which the only mode of finding the way is to follow a line of reeds fixed in the sand, as the wind causes footprints to be

covered up immediately; another route beginning two miles bevond Mount Casius and after 60 miles rejoining the road from Pelusiumalong this route dwell the Arab tribe of the Autaei; and a third starting from Gerrum, called the Agipsum route, passing through the same Arab tribe, which is 60 miles shorter but rough and mountainous, as well as devoid of watering-places. All these routes lead to Arsino, the city on Carandra Bay founded and named after his sister by Ptolemy Philadelphus, who first thoroughly explored the Cave-dweller country and gave his own name to the river on which Arsinod stands. Soon after comes the small town of Aenumother writers give the name as Philoteria insteadand then there are the Asarri, a wild Arab tribe sprung from intermarriage with the Cave-dwellers, the islands of Sapirine and Scytala, and then desert stretching as far as Myoshormos, where is the spring of Amos, Mount Eos, Iambe Island, a number of harbours, the town of Berenice named from the mother of Philadelphus, the road to which from Coptus we have described, and the Arab tribes of the Autaei and Gebadaei.

34. Cave-dwellers' country, called in former times Mido and by other people Midio, Mount Five-fingers, some islands called the Narrow Necks, the Halonesi about the same in number, Cardamine, and Topazos, which has given its name to the precious stone. A bay crowded with islands, of which the ones called the Islands of Matreos have springs on them and those called Erato's Islands are dry; these islands formerly had governors appointed by the kings. Inland are the Candaei, who are called the Ophiophagi because it is their habit to eat snakes, of which the district is exceptionally productive. Juba, who appears to have investigated these matters extremely carefully, has omitted to mention in this district (unless there is an error in the copies of his work) a second town called Berenice which has the additional name of All-golden, and a third called Berenice on the Neck, which is remarkable for its situation, being placed on a neck of land projecting a long way out, where the straits at the mouth of the Red Sea separate Africa from Arabia by a space of only 7 miles. Here is the island of Cytis, which itself also produces the chrysolite. Beyond there are forests, in which is Ptolemais, built by Ptolemy Philadelphus for the purpose of elephant-hunting and consequently called Ptolemy's Hunting Lodge; it is close to Lake Monoleus. This is the district referred to by us in Book 2, in which during the 45 days before midsummer and the same number of days after midsummer shadows contract to nothing an hour before noon, and during the rest of the day fall to the south, while all the other days of the year they fall to the north; on the other hand at the first Berenice mentioned above, on the actual day of the summer solstice the shadow disappears altogether an hour before noon, but nothing else unusual is observedthis place is 602 miles from Ptolemais. The phenomenon is extremely remarkable, and the topic is one involving infinitely profound research, it being here that the structure of the world was discovered, because Eratosthenes derived from it the idea of working out the earth's dimensions by the certain method of noting the shadows.

Next come the Azanian Sea, the cape whose name some writers give as Hippalus, Lake Mandalum, Colocasitis Island, and out at sea a number of islands containing a large quantity of turtle. The town of Sacae, the island of Daphnis, Freemen's Town, founded by slaves from Egypt who had run away from their. masters. Here is very large trading centre of the Cavedwellers and also the Ethiopiansit is two days' sail from Ptolemais; they bring into it a large quantity of ivory, rhinoceros horns, hippopotamus hides, tortoise shell, apes and slaves. Beyond the Ploughmen Ethiopians are the islands called the Isles of Aliaeos, and also Bacchias and Antibacchias. and Soldiers' Island. Next there is a bay in the coast of Ethiopia that has not been explored, which is surprising, in view of the fact that traders ransack more remote districts: and a cape on which is a spring named Cucios, resorted to by seafarers; and further on, Port of Isis, ten days' row distant from Freemen's Town, and a centre to which Cave-dwellers' myrrh is brought. There are two islands off the harbour called the False Gates, and two inside it called the Gates, on one of which are some stone monuments with inscriptions in an unknown alphabet. Further on is the Bay of Abalitos, and then Diodorus's Island and other uninhabited islands, and also along the mainland a stretch of desert; the town of Gaza; Mossylites Cape and Harbour, the latter the port of export for cinnamon. This was the farthest point to which Sesostris led his army. Some writers place one Ethiopian town on the coast beyond this point, Baragaza.

Juba holds that at Cape Mossylites begins the Atlantic Ocean, navigable with a north-west wind along the coast of his kingdom of the Mauretanias as far as Cadiz; and his whole opinion must not be omitted at this point in the narrative. He puts forward the view that the distance from the cape in the Indian territory called in Greek the Narrow Head, and by others the Sickle, in a straight course past Burnt Island to Malichas's Islands is 1500 miles, from there to the place called Scaenei 225 miles, and on from there to Sadanus Island 150 milesmaking 1875 miles to the open sea. All the rest of the authorities have held the view that the heat of the sun makes

the voyage impossible; moreover actual goods conveyed for trade are exposed to the depredations of an Arabian tribe living on the islands: who are called the Ascitae because they make rafts of timber placed on a pair of inflated ox-hides and practise piracy, using poisoned arrows. Juba also speaks of some tribes of Cave-dwellers called the Jackal-hunters, because of their skill in hunting, who are remarkable for their swiftness, and also of the Fish-eaters, who can swim like creatures of the sea: also the Bangeni, Zangenae, Thalibae, Saxinae, Sirecae, Daremae and Domazenes. Juba states moreover that the people inhabiting the banks of the Nile from Syene as far as Mero are not Ethiopian but Arabian tribes and also that the City of the Sun, which in our description of Egypt we spoke of as not far from Memphis, had Arab founders. The further bank also is by some authorities taken away from Ethiopia and attached to Africa. (But they lived on the banks for the sake of the water.) We however shall leave this point to the reader to form his own opinion on it, and shall enumerate the towns on either bank in the order in which they are reported, starting from Syene.

35. And taking the Arabian side of the Nile first, we have the Catadupi tribe, and then the Syenitae, and the towns of Tacompson (which some have called Thatice), Aramum, Sesamos, Andura, Nasardunia, Aindoxna Village with Arabeta and Bongiana, Leuphitorga, Tautarene, Meae, Chindita, Noa, Gopba, Gistate, Megada, Lea, Remni, Nups, Dfrea, Patinga, Bagada, Durnana, Radata (where a golden cat used to be worshipped as a god), Boron, and inland Mero, near Mallos. This is the account given by Bion. Juba's is different: he says that there is a fortified town called the Great Wall between Egypt and Ethiopia, the Arabic name for which is Mirsios, and then Tacompson, Aramum, Sesamos, Pide, Mamuda, Corambis near a spring of mineral pitch, Amodota, Prosda, Parenta, Mania, Tessata, Galles, Zoton, Graucome, Emeus, Pidibotae, Endondacometae, Nomad tribes living in tents, Cystaepe, Little Magadale, Prumis, Nups, Dicelis, Patingas, Breves, New Magus, Egasmala, Cramda, Denna, Cadeus, Mathena, Batta, Alana, Macna, Scammos, Gora, and on an island off these places Abale, Androcalis, Seres, Mallos and Agoces.

The places on the African side are given as Tacompsus (either a second town of the same name or a suburb of the one previously mentioned), Mogore, Saea, Aedosa, Pelenariae, Pindis, Magassa, Buma, Lintuma, Spintnm, Sidopt, Gensoe, Pindicitor, Agugo, Orsmn, Suara, Maumarnm, Urbim, Mulon (the town called by the Greeks Hypaton), Pagoartas, Zamnes (after which elephants begin to be found), Mambli, Berressa, Coetum. There was also formerly a town called Epis, opposite to Mero, which had been destroyed before Bion wrote.

These are the places that were reported as far as Mero. though at the present day hardly any of them still exist on either side of the river; at all events an exploring party of praetorian troops under the command of a tribune lately sent by the emperor Nero, when among the rest of his wars he was actually contemplating an attack on Ethiopia, reported that there was nothing but desert. Nevertheless in the time of his late Majesty Augustus the arms of Rome had penetrated even into those regions, under the leadership of Publius Petronius, himself also a member of the Order of Knighthood, when he was Governor of Egypt. Petronius captured the Arabian towns of which we will give a list, the only ones we have found there: Pselcis, Primi, Bocchis, Cambyses' Market, Attenia and Stadissis, where there is a cataract of the Nile the noise of which affects people dwelling near it with deafness; he also sacked the town of Napata. The farthest point he reached was 870 miles from Svene: but nevertheless it was not the arms of Rome that made the country a desert: Ethiopia was worn out by alternate periods of dominance and subjection in a series of wars with Egypt, having been a famous and powerful country even down to the Trojan wars, when Memnon was king; and the stories about Andromeda show that it dominated Syria and the coasts of the Mediterranean in the time of King Cepheus

Similarly there have also been various reports as to the dimensions of the country, which were first given by Dalion, who sailed up a long way beyond Mero, and then by Aristocreon and Bion and Basilis, and also by the younger Simonides, who stayed at Mero for five years while writing his account of Ethiopia. Further, Timosthenes, who commanded the navies of Philadelphus, has stated the distance from Svene to Mero as sixty days' journey, without specifying the mileage per diem, while Eratosthenes gives it as 625 miles and Artemidorus as 600 miles; and Sebosus says that from the extreme point of Egypt to Mero is 1672 miles, whereas the authors last mentioned give it as 1250 a miles. But all this discrepancy has recently been ended, inasmuch as the expedition sent by Nero to explore the country have reported that the distance from Svene to Mero is 945 miles made up as follows: from Syene to Holy Mulberry 54 miles, from there to Tama 72 miles through the district of the Ethiopian Euonymites, to Primi 120 miles, Acina 64 miles, Pitara 22 miles, Tergedus 103 miles. The report stated that the island of Gagaudes is halfway between Syene and Meroe, and that it

was after passing this island that the birds called parrots were first seen, and after another, named Articula, the sphingion ape, and after Tergedus dog-faced baboons. The distance from Tergedus to Nabata is 80 miles, that little town being the only one among those mentioned that survives; and from Nabata to the island of Mero is 360 miles. Round Mero, they reported, greener herbage begins, and a certain amount of forest came into view, and the tracks of rhinoceroses and elephants were seen. The actual town of Mero they said is at a distance of 70 miles from the first approach to the island, and beside it in the channel on the right hand as one goes up stream lies another island, the Isle of Tados, this forming a harbour; the town possesses few buildings. They said that it is ruled by a woman, Candace, a name that has passed on through a succession of queens for many years; and that religious ceremonies take place in a temple of Hammon in the town and also in shrines of Hammon all over the district. Moreover at the time of the Ethiopic dominion this island was extremely celebrated. It is reported that it used to furnish 250,000 armed men and 3000 artisans. At the present day there are reported to be forty-five other kings of Ethiopia. But the whole race was called Aetheria, and then Atlantia, and finally it took its name from Aethiops the son of Vulcan. It is by no means surprising that the outermost districts of this region produce animal and human monstrosities, considering the capacity of the mobile element of fire to mould their bodies and carve their outlines. It is certainly reported that in the interior on the east side there are tribes of people without noses, their whole face being perfectly flat, and other tribes that have no upper lip and others no tongues. Also one section has the mouth closed up and has no nostrils, but only a single orifice through which it breathes and sucks in drink by means of oat straws, as well as grains of oat, which grows wild there, for food. Some of the tribes communicate by means of nods and gestures instead of speech; and some were unacquainted with the use of fire before the reign of King Ptolemy Lathyrus in Egypt. Some writers have actually reported a race of Pygmies living among the marshes in which the Nile rises. On the coast, in a region which we shall describe later, there is a range of mountains of a glowing red colour, which have the appearance of being on fire.

After Mero all the region is bounded by the Cave-dwellers and the Red Sea, the distance from Napata to the coast of the Red Sea being three days' journey; in several places rainwater is stored for the use of travellers, and the district in between produces a large amount of gold. The parts beyond are occupied by the Atabuli, an Ethiopian tribe; and then, over against Mero, are the Megabarri, to whom some give the name of Adiabari: they have a town named the Town of Apollo, but one division of them are Nomads, and live on the flesh of elephants. Opposite to them, on the African side, are the Macrobii, and again after the Megabarri come the Memnones and Dabelli, and 20 days' journey further on the Critensi. Beyond these are the Doehi, next the Gymnetes, who never wear any clothes, then the Anderae. Mattitae and Mesanches: the last are ashamed of their black colour and smear themselves all over with red clay. On the African side are the Medimni, and then a Nomad tribe that lives on the milk of the dog-faced baboon, the Alabi, and the Syrbotae who are said to be 12 ft. high. Aristocreon reports that on the Lybian side five days' journey from Mero is the town of Tolles, and twelve days beyond it another town, Aesar, belonging to Egyptians who fled to escape from Psammetichus (they are said to have been living there for 300 years), and that the town of Diaron on the Arabian side opposite belongs to them. To the town which Aristocrates calls Aesar Bion gives the name of Sapes, which he says means that the inhabitants are strangers; their chief city is Sembobitis, situated on an island, and they have a third town named Sinat, in Arabia, Between the mountains and the Nile are the Simbarri, the Palunges and, on the actual mountains, the numerous tribes of Asachae, who are said to be five days' journey from the sea; they live by hunting elephants. An island in the Nile, belonging to the Sembritae, is governed by a queen. Eight days' journey from this island are the Nubian Ethiopians, whose town Tenupsis is situated on the Nile, and the Sesambri, in whose country all the four-footed animals, even the elephants, have no ears. On the African side are the Ptonebari; the Ptoemphani, who have a dog for a king and divine his commands from his movements; the Harusbi, whose town is situated a long distance away from the Nile; and afterwards the Arehisarmi, Phalliges, Marigarri and Chasamari. Bion also reports other towns situated on islands: after Sembobitis, in the direction of Mero, the whole distance being twenty days' journey, on the first island reached, a town of the Semberritae, governed by a queen, and another town named Asara; on the second island, the town of Darde; the third island is called Medoe, and the town on it is Asel: the fourth is Garrofi, with a town of the same name. Then along the banks are the towns of Nautis, Madum, Demadatis, Secande, Navectabe with the territory of Psegipta, Candragori, Araba, Summara. Above is the region of Sirbitum, where the mountain range ends, and which is stated by some writers to be occupied by Ethiopian coast-tribes, the Nisicathae and Nisitae, names that mean 'men with three' or

THE GRAND BIBLE

'with four eyes'not because they really are like that but because they have a particularly keen sight in using arrows. On the side of the Nile that stretches inland from the Greater Syrtes and the southern ocean. Dalion says there are the Vacathi, who use only rainwater, the Cisori, the Logonpori five days' journey from the Oecalices, the Usibalchi, Isbeli, Perusii, Ballii and Cispii; and that all the rest of the country is uninhabited. Then come regions that are purely imaginary: towards the west are the Nigroi, whose king is said to have only one eye, in his forehead; the Wild-beast-eaters, who live chiefly on the flesh of panthers and lions; the Eatalls, who devour everything; the Man-eaters, whose diet is human flesh; the Dog-milkers, who have dogs' heads; the Artabatitae, who have four legs and rove about like wild animals; and then the Hesperioi, the Perorsi and the people we have mentioned as inhabiting the border of Mauretania. One section of the Ethiopians live only on locusts, dried in smoke and salted to keep for a year's supply of food; these people do not live beyond the age of forty.

The length of the whole of the territory of the Ethiopians including the Red Sea was estimated by Agrippa as 2170 miles and its breadth including Upper Egypt 1296 miles. Some authors give the following divisions of its length: from Mero to Sirbitus 12 days' sail, from Sirbitus to the Dabelli 12 days' sail, and from the Dabelli to the Ethiopic Ocean 6 days' journey by land. But authorities are virtually agreed that the whole distance from the ocean to Mero is 625 miles and that the distance from Meroe to Svene is what we have stated above The conformation of Ethiopia spreads from south-east to south-west with its centre line running south. It has flourishing forests, mostly of ebony trees. Rising from the sea at the middle of the coast is a mountain of great height which glows with eternal firesits Greek name is the Chariot of the Gods; and four days' voyage from it is the cape called the Horn of the West, on the confines of Africa, adjacent to the Western Ethiopians. Some authorities also report hills of moderate height in this region, clad with agreeable shady thickets and belonging to the Goat-Pans and Satyrs.

36. It is stated by Ephorus, and also by Eudoxus and Timosthenes, that there are a large number of islands scattered over the whole of the Eastern Sea: while Clitarchus says that King Alexander received a report of one that was so wealthy that its inhabitants gave a talent of gold for a horse, and of another on which a holy mountain had been found, covered with a dense forest of trees from which fell drops of moisture having a marvellously agreeable scent. An island opposite the Persian Gulf and lying off Ethiopia is named Cerne: neither its size nor its distance from the mainland has been ascertained, but it is reported to be inhabited solely by Ethiopian tribes. Ephorus states that vessels approaching it from the Red Sea are unable became of the heat to advance beyond the Columnsthat being the name of certain small islands. Polybius informs us that Cerne lies at the extremity of Mauretania, over against Mount Atlas, a mile from the coast; Cornelius Nepos gives it as being nearly in the same meridian as Carthage, and 10 miles from the mainland, and as measuring not more than 2 miles round. There is also reported to be another island off Mount Atlas, itself also called Atlantis, from which a two days' voyage along the coast reaches the desert district in the neighbourhood of the Western Ethiopians and the cape mentioned above named the Horn of the West, the point at which the coastline begins to curve westward in the direction of the Atlantic. Opposite this cape also there are reported to be some islands, the Gorgades, which were formerly the habitation of the Gorgons, and which according to the account of Xenophon of Lampsacus are at a distance of two days' sail from the mainland. These islands were reached by the Carthaginian general Hanno, a who reported that the women had hair all over their bodies. but that the men were so swift of foot that they got away; and he deposited the skins of two of the female natives in the Temple of Juno as proof of the truth of his story and as curiosities, where they were on show until Carthage was taken by Rome. Outside the Gorgades there are also said to be two Islands of the Ladies of the West; and the whole of the geography of this neighbourhood is so uncertain that Statius Sebosus has given the voyage along the coast from the Gorgons' Islands past Mount Atlas to the Isles of the Ladies of the West as forty days' sail and from those islands to the Horn of the West as one day's sail. Nor is there less uncertainty with regard to the report of the islands of Mauretania: it is only known for certain that a few were discovered by Juba off the coast of the Antololes, in which he had established a dyeing industry that used Gaetulian purple.

37. Some people think that beyond the islands of Mauretania lie the Isles of Bliss, [Canaries] and also some others of which Sebosus before mentioned gives not only the number but also the distances, reporting that Junonia is 750 miles from Gadiz, and that Pluvialia [Ferero] and Capraria [Gomera] are the same distance west from Junonia; that in Pluvialia there is no water except what is supplied by rain; that the Isles of Bliss are 250 miles N.N.W. from these, to the left hand of Mauretania, and that one is called Invalis [Tenerife] from its undulating surface and the other Planasia

[Great Canary Is.] from its conformation, Invallis measuring 300 miles round; and that on it trees grow to a height of 140 ft. About the Isles of Bliss Juba has ascertained the following facts: they lie in a southwesterly direction, at a distance of 625 miles' sail from the Purple Islands, provided that a course be laid north of due west for 250 miles and then east for 375 miles: that the first island reached is called Ombrios, and there are no traces of buildings upon it, but it has a pool surrounded by mountains, and trees resembling the giant fennel, from which water is extracted, the black ones giving a bitter fluid and those of brighter colour a juice that is agreeable to drink; that the second island is called Junonia, and that there is a small temple on it built of only a single stone; and that in its neighbourhood there is a smaller island of the same name. and then Capraria, which swarms with large lizards; and that in view from these islands is Ninguaria, so named from its perpetual snow, and wrapped in cloud; and next to it one named Canaria, from its multitude of dogs of a huge size (two of these were brought back for Juba). He said that in this island there are traces of buildings; that while they all have an abundant supply of fruit and of birds of every kind. Canada also abounds in palm-groves bearing dates, and in conifers; that in addition to this there is a large supply of honey, and also papyrus grows in the rivers, and sheat-fish; and that these islands are plagued with the rotting carcases of monstrous creatures that are constantly being cast ashore by the sea

38. And now that we have fully described the outer and inner regions of the earth, it seems proper to give a succinct account of the dimensions of its various bodies of water.

According to Polybius the distance in a straight line from the Straits of Gibraltar to the outlet of the Sea of Azov is 3437 miles, and the distance from the same starting point due eastward to Sicily 1250 miles, to Crete 375 miles, to Rhodes 187 miles, to the Swallow Islands the same, to Cyprus 225 miles, and from Cyprus to Seleukeh Pieria in Syria 115 mileswhich figures added together make a total of 2340 miles. Agrippa calculates the same distance in a straight line from the Straits of Gibraltar to the Gulf of Scanderoon at 3440 miles, in which calculation I suspect there is a numerical error, as he has also given the length of the route from the Straits of Sicily to Alexandria as 1350 miles. The whole length of the coastline round the bays specified, starting at the same point and ending at the Sea of Azov, amounts to 15,509 milesalthough Artemidorus puts it at 756 miles more, and also reports that the total coastline including the shores of Azov measures 17,390 miles.

This is the measurement made by persons throwing out a challenge to Fortune not by force of arms, but by the boldness they have displayed in time of peace.

We will now compare the dimensions of particular parts of the earth, however great the difficulty that will arise from the discrepancy of the accounts given by authors; nevertheless the matter will be most suitably presented by giving the breadth in addition to the length. The following, then, is the formula for the area of Europe ... length 8148 miles. As for Africato take the average of all the various accounts given of its dimensionsits length works out at 3798 miles, and the breadth of the inhabited portions nowhere exceeds 750 miles; but as Agrippa made it 910 miles at the Cyrenaic part of the country, by including the African desert as far as the country of the Garamantes, the extent then known, the entire length that will come into the calculation amounts to 4708 miles. The length of Asia is admittedly 6375 miles, and the breadth should properly be calculated from the Ethiopic Sea to Alexandria on the Nile, making the measurement run through Meroe and Syene, which gives 1875 miles. It is consequently clear that Europe is a little less than one and a half times the size of Asia, and two and one sixth times the width of Africa. Combining all these figures together, it will be clearly manifest that Europe is a little more than $\frac{1}{3}$ + $\frac{1}{8}$ th, Asia + 1/14th, and Africa 1/5 + 1/60th, of the whole earth.

39. To these we shall further add one theory of Greek discovery showing the most recondite ingenuity, so that nothing may be wanting in our survey of the geography of the world, and so that now the various regions have been indicated, it may be also learnt what alliance or relationship of days and nights each of the regions has, and in which of them the shadows are of the same length and the world's convexity is equal. An account will therefore be given of this also, and the whole earth will be mapped out in accordance with the constituent parts of the heavens.

The world has a number of segments to which our countrymen give the name of 'circles' and which the Greeks call 'parallels'. The first place belongs to the southward part of India, extending as far as Arabia and the people inhabiting the coast of the Red Sea. This segment includes the Gedrosians, Carmanians, Persians, and Elymaeans, Parthyene, Aria, Susiane, Mesopotamia, Babylonian Seleucia, Arabia as far as Petra, Hollow Syria, Pelusium, the lower parts of Egypt called Chora, Alexandria, the coastal parts of Africa, all the towns of Cyrenaica, Thapsus, Hadrumeturu, Clupea, Carthage, Utica, the two Hippos, Numidia, the two Mauretanias, the Atlantic Ocean, the Straits of Gibraltar. In

Copyright © 2018 by Lord Henfield, Guildford Scientific Press PAGE 3458 this latitude, at noon at the time of the equinox a sundial-pin or 'gnomon' 7 ft. long casts a shadow not more than 4 ft. long, while the longest night and the longest day contain 14 equinoctial hours, and the shortest on the contrary 10.

The next parallel begins with the western part of India, and runs through the middle of Parthia, Versepolis, the nearest parts of Farsistan, Hither Arabia, Judaea and the people living near Mount Lebanon, and embraces Babylon, Idumaea, Samaria, Jerusalem, Ascalon, Joppa, Caesarea, Phoenicia, Ptolemais, Sidon, Tyre, Berytus, Botrys, Tripolis, Byblus, Antioch, Laodicea, Seleucia, seaboard Cilicia, Southern Cyprus, Crete, Lilybaeum in Sicily. Northern Africa and Northern Numidia. At the equinox a 35 ft. gnomon throws a shadow 24 ft. long, while the longest day and the longest night measure 14 2/5 equinoctial hours.

The third parallel begins at the part of India nearest to the Himalayas, and passes through the Caspian Gates, the nearest parts of Media, Cataonia, Cappadocia, Taurus, Amanus, Issus, the Cilician Gates, Soli, Tarsus, Cyprus, Pisidia, Pamphylia, Side, Lycaonia, Lycia, Patara, Xanthus, Caunus, Rhodes, Cos, Halicarnassus, Cnidus, Doris, Chios, Delos, the middle of the Cyclades, Gythiuxn, Malea, Argos, Laconia, Ella, Olympia and Messenia in the Peloponnese, Syracuse, Catania, the middle of Sicily, the southern parts of Sardinia, Carteia, Cadiz. A gnomon 100 inches long throws a shadow 77 inches long. The longest day is 14 8/15 equinoctial hours.

Under the fourth parallel lie the regions on the other side of the Imavus, the southern parts of Cappadocia, Oalatia, Mysia, Sardis, Smyrna, Mount Sipylus, Mount Tmolus, Lydia, Carla, Ionia, Trails, Colophon, Ephesus, Miletus, Chios, Samos, the Icarian Sea, the northern part of the Cyclades, Athens, Megara, Corinth, Sicyon, Achaia, Patras, the Isthmus, Epirus, the northern districts of Sicily, the eastern districts of Gailia Narbonensis, and the coast of Spain from New Carthage westward. A 21-ft, gnomon has 16-ft, shadows. The longest day has 144 equinoctial hours.

The fifth division, beginning at the entrance of the Caspian Sea, contains Bactria, Liberia, Armenia, Mysia, Phrygia, the Dardanelles, the Troad, Tenedos, Abydos, Scepsis, Ilium, Mount Ida, Cyzicus, Lampsacus, Sinope, Amisus, Heraclea in Pontus, Paphlagonia, Lemnos, Imbros, Thasos, Cassandria, Thessaly, Macedon, Larisa, Amphipolis, Thessalonica, Pella, Edesus, Beroea, Pharsalia, Carystum, Euboca belonging to Boeotia, Chalcis, Delphi, Acarnania, Aetolia, Apollonia, Brindisi, Taranto, Thurii, Locri, Reggio, the Lucanian territory, Naples, Pozzuoli, the Tuscan Sea, Corsica, the Baiearic Islands and the middle of Spain. A 7-ft. gnomon throws a 6-ft. shadow. The longest day is 15 equinoctial hours.

The sixth group, the one containing the city of Rome, comprises the Caspian tribes, the Caucasus, the northern parts of Armenia, Apollonia on the Rhyndaeus, Nicomedia, Nicaea, Chalcedon, Byzantium, Lysimachea, the Chersonese, the Gulf of Melas, Abdera, Samothrace, Maronea, Aenos, Bessica, Thrace, Maedica, Paeonia, Illyria, Durazzo, Canosa, the edge of Apulia, Campania, Etruria, Pisa, Luna, Lucca, Genoa, Liguria, Antibes, Marseilles, Narbonne, Tarragon, the middle of Tarragonian Spain; and then runs through Lusitania. A 9-ft. gnomon throws an 8-ft. shadow. The longest day-time is 15 1/9, or, according to Nigidius, 15 1/5 equinoctial hours.

The seventh division starts from the other side of the Caspian Sea and passes above Collat, the Straits of Kertsch, the Dnieper, Tomi, the back parts of Thrace, the Triballi, the remainder of Illyria, the Adriatic Sea, Aquileia, Altinum, Venice, Vicenza, Padua, Verona, Cremona, Ravenna, Ancona, Picenum, the Marsians, Paelignians and Sabines, Umbria, Rimini, Bologna, Piacenza, Milan and all the districts at the foot of the Apennines, and across the Alps Aquitanian Gaul, Vienne, the Pyrenees and Celtiberia. A 35-ft. gnomon throws 36-ft. shadows, except that in part of the Venetian district the shadow and the gnomon are equal. The longest daytime consists of 15 3/5 equinoctial hours.

Up to this point we have been setting forth the results worked out by the ancients. The rest of the earth's surface has been allotted by the most careful among subsequent students to three additional parallels: from the Don across the Sea of Azov and the country of the Sarmatae to the Dnieper and so across Dacia and part of Germany, and including the Gallic provinces forming the coasts of the Ocean, making a parallel with a sixteen-hour longest day; the next across the Hyperboreans and Britain, with a seventeen-hour day; the last the Scythian parallel from the Ripaean mountain-range to Thule, in which, as we said above, there are alternate periods of perpetual daylight and perpetual night.

The same authorities also place two parallels before we made the starting point, the first running through the island of Meroe and Ptolemy's Lodge built on the Red Sea for the sake of elephant-hunting, in which parallel the longest day will be 12 hours, and the second passing through Syene in Egypt, with a 13-hour day; and they also add half an hour to each of the parallels up to the last.

So far as to the geography of the world.

NATURAL HISTORY BOOK 7

The above is a description of the world, and of the lands, races, seas, important rivers, islands and cities that it contains.

The nature of the animals also contained in it is not less important than the study of almost any other department, albeit here too the human mind is not capable of exploring the whole field.

The first place will rightly be assigned to man, for whose sake [great] Nature appears to have created all other thingsthough she asks a cruel price for all her generous gifts, making it hardly possible to judge whether she has been more a kind parent to man or more a harsh stepmother. First of all, man alone of all animals she drapes with borrowed resources. On all the rest in various wise she bestows coveringsshells, bark, spines, hides, fur, bristles, hair, down, feathers, scales, fleeces: even the trunks of trees she has protected against cold and heat by bark, sometimes in two layers: but man alone on the day of his birth she casts away naked on the naked ground, to burst at once into wailing and weeping, and none other among all the animals is more prone to tears, and that immediately at the very beginning of life; whereas, I vow, the much-talked-of smile of infancy even at the earliest is bestowed on no child less than six weeks old. This initiation into the light is followed by a period of bondage such as befalls not even the animals bred in our midst, fettering all his limbs; and thus when successfully born he lies with hands and feet in shackles, weepingthe animal that is to lord it over all the rest, and he initiates his life with punishment because of one fault only, the offence of being born. Alas the madness of those who think that from these beginnings they were bred to proud estate!

His earliest promise of strength and first grant of time makes him like a four-footed animal. When does man begin to walk? when to speak? when is his mouth firm enough to take food? how long does his skull throb, a mark of his being the weakest among all animals? Then his diseases, and all the cures contrived against his illsthese cures also subsequently defeated by new disorders! And the fact that all other creatures are aware of their own nature, some using speed, others swift flight, others swimming, whereas man alone knows nothing save by educationneither how to speak nor how to walk nor who to eat; in short the only thing he can do by natural instinct is to weep! Consequently there have been many who believed that it were best not to be born, or to be put away as soon as possible. On man alone of living creatures is bestowed grief, on him alone luxury, and that in countless forms and reaching every separate part of his frame; he alone has ambition, avarice, immeasurable appetite for life, superstition anxiety about burial and even about what will happen after he is no more. No creature's life is more precarious, none has a greater lust for all enjoyments, a more confused timidity, a fiercer rage. In fine, all other living creatures pass their time worthily among their own species: we see them herd together and stand firm against other kinds of animalsfierce lions do not fight among themselves, the serpent's bite attacks not serpents, even the monsters of the sea and the fishes are only cruel against different species; whereas to man, I vow, most of his evils come from his fellowman.

1. And about the human race as a whole we have in large part spoken in our account of the various nations. Nor shall we now deal with manners and customs, which are beyond counting and almost as numerous as the groups of mankind; vet there are some that I think ought not to be omitted, and especially those of the people living more remote from the sea; some things among which I doubt not will appear portentous and incredible to many. For who ever believed in the Ethiopians before actually seeing them? or what is not deemed miraculous when first it comes into knowledge? how many things are judged impossible before they actually occur? Indeed the power and majesty of the nature of the universe at every turn lacks credence if one's mind embraces parts of it only and not the whole. Not to mention peacocks, or the spotted skins of tigers and panthers and the colourings of so many animals, a small matter to tell of but one of measureless extent if pondered on is the number of national languages and dialects and varieties of speech, so numerous that a foreigner scarcely counts as a human being for someone of another race! Again though our physiognomy contains ten features or only a few more, to think that among all the thousands of human beings there exist no two countenances that are not distincta thing that no art could supply by counterfeit in so small a number of specimens! Nevertheless in most instances of these I shall not myself pledge my own faith, and shall preferably ascribe the facts to the authorities who will be quoted for all doubtful points: only do not let us be too proud to follow the Greeks, because of their far greater industry or older devotion to study

2. We have pointed out that some Scythian tribes, and in fact a good many, feed on human bodiesa statement that perhaps may seem incredible if we do not reflect that races of this portentous character have existed in the central region of the world, named Cyclopes and Laestrygones, and that quite recently the tribes of the parts beyond the Alps habitually practised human sacrifice, which is not far removed from eating human flesh. But also a tribe is reported next to these,

towards the North, not far from the actual quarter whence the North Wind rises and the cave that bears its name, the place called the Earth's Doorbolt the Arimaspi whom we have spoken of already, people remarkable for having one eye in the centre of the forehead. Many authorities, the most distinguished being Herodotus and Aristeas of Proconnesus, write that these people wage continual war around their mines with the griffins, a kind of wild beast with wings, as commonly reported, that digs gold out of mines, which the creatures guard and the Arimaspi try to take from them, both with remarkable covetousness.

But beyond the other Scythian cannibals, in a certain large valley in the Himalayas, there is a region called Abarimon where are some people dwelling in forests who have their feet turned backward behind their legs, who run extremely fast and range abroad over the country with the wild animals. It is stated by Baeton, Alexander the Great's route-surveyor on his journeys, that these men are unable to breathe in another climate, and that consequently none of them could be brought to the neighbouring kings or had ever been brought to Alexander. According to Isogonus of Nicaea the former cannibal tribes whom we stated to exist to the north, ten days journey beyond the river Dnieper, drink out of human skulls and use the scalps with the hair on as napkins hung round their necks. The same authority states that certain people in Albania are born with keen grey eyes and are bald from childhood, and that they see better by night than in the daytime. He also says that the Sauromatae, thirteen days' journey beyond the Dnieper, always take food once every two davs.

Crates of Pergamum states that there was a race of men round Parium on the Dardanelles, whom he calls Ophiogenes, whose custom it was to cure snakebites by touch and draw the poison out of the body by placing their hand on it. Varro says that there are still a few people there whose spittle is a remedy against snakebites. According to the writings of Agatharchides there was also a similar tribe in Africa, the Psylli, named after King Psyllus, whose tomb is in the region of the greater Syrtes. In their bodies there was engendered a poison that was deadly to snakes, and the smell of which they employed for sending snakes to sleep, while they had a custom of exposing their children as soon as they were born to the most savage snakes and of using that species to test the fidelity of their wives, as snakes do not avoid persons born with adulterous blood in them. This tribe itself has been almost exterminated by the Nasamones who now occupy that region, but a tribe of men descended from those who had escaped or had been absent when the fighting took place survives today in a few places. A similar race lingers on in Italy also, the Marsi, said to be descended from the son of Circe and to possess this natural property on that account. However, all men contain a poison available as a protection against snakes: people say that snakes flee from contact with saliva as from the touch of boiling water, and that if it gets inside their throats they actually die: and that this is especially the case with the saliva of a person fasting.

Beyond the Nasamones and adjacent to them Calliphanes records the Machlyes, who are Adrogyni and perform the function of either sex alternately. Aristotle adds that their left breast is that of a man and their right breast that of a woman. Isogonus and Nymphodorus report that there are families in the same part of Africa that practise sorcery, whose praises cause meadows to dry up, trees to wither and infants to perish. Isogonus adds that there are people of the same kind among the Triballi and the Illyrians, who also bewitch with a glance and who kill those they stare at for a longer time, especially with a look of anger, and that their evil eye is most felt by adults; and that what is more remarkable is that they have two pupils in each eye. Apollonides also reports women of this kind in Scythia, who are called the Bitiae, and Phylarchus also the Thibii tribe and many others of the same nature in Pontus, whose distinguishing marks he records as being a double pupil in one eye and the likeness of a horse in the other, and he also says that they are incapable of drowning, even when weighed down with clothing. Damon records a tribe not unlike these in Ethiopia, the Pharmaces, whose sweat relieves of diseases bodies touched by it. Also among ourselves Cicero states that the glance of all women who have double pupils is injurious everywhere. In fact when nature implanted in man the wild beasts' habit of devouring human flesh, she also thought fit to implant poisons in the whole of the body, and with some persons in the eves as well, so that there should be no evil anywhere that was not present in man.

There are a few families in the Faliscan territory, not far from the city of Rome, named the Hirpi, which at the yearly sacrifice to Apollo performed on Mount Soracte walk over a charred pile of logs without being scorched, and who consequently enjoy exemption under a perpetual decree of the senate from military service and all other burdens. Some people are born with parts of the body possessing special remarkable properties, for instance King Pyrrhus in the great toe of his right foot, to touch which was a cure for inflammation of the spleen; it is recorded that at his

encee cremation it proved impossible to bum the toe with the rest of the body, and it was stored in a chest in a temple. India and parts of Ethiopia especially teem with marvels.

The biggest animals grow in India: for instance Indian dogs are bigger than any others. Indeed the trees are said to be so lofty that it is not possible to shoot an arrow over them, and [the richness of the soil, temperate climate and abundance of springs bring it about] that, if one is willing to believe it, squadrons of cavalry are able to shelter beneath a single figtree; while it is said that reeds are of such height that sometimes a single section between two knots will make a canoe that will carry three people. It is known that many of the inhabitants are more than seven feet six inches high, never spit, do not suffer from headache or toothache or pain in the eves, and very rarely have a pain in any other part of the bodyso hardy are they made by the temperate heat of the sun; and that the sages of their race, whom they call Gymnosophists, stay standing from sunrise to sunset, gazing at the sun with eyes unmoving, and continue all day long standing first on one foot and then on the other in the glowing sand. Megasthenes states that on the mountain named Nulus there are people with their feet turned backwards and with eight toes on each foot, while on many of the mountains there is a tribe of human beings with dogs' heads, who wear a covering of wild beasts' skins, whose speech is a bark and who live on the produce of hunting and fowling, for which they use their nails as weapons; he says that they numbered more than 120,000 when he published his work. Ctesias writes that also among a certain race of India the women bear children only once in their lifetime, and the children begin to turn grey directly after birth; he also describes a tribe of men called the Monocolia who have only one leg, and who move in jumps with surprising speed; the same are called the Umbrella-foot tribe, because in the hotter weather they lie on their backs on the ground and protect themselves with the shadow of their feet; and that they are not far away from the Cave-dwellers; and again westward from these there are some people without necks, having their eyes in their shoulders. There are also satyrs [doubtless a kind of monkey] in the mountains in the east of India (it is called the district of the Catarcludi): this is an extremely swift animal. sometimes going on all fours and sometimes standing upright as they run, like human beings; because of their speed only the old ones or the sick are caught. Tauron gives the name of Choromandae to a forest tribe that has no speech but a horrible scream, hairy bodies, keen grey eyes and the teeth of a dog. Eudoxus says that in the south of India men have feet eighteen inches long and the women such small feet that they are called Sparrowfeet. Megasthenes tells of a race among the Nomads of India that has only holes in the place of nostrils, like snakes, and bandy-legged; they are called the Sciritae. At the extreme boundary of India to the East, near the source of the Ganges, he puts the Astomi tribe, that has no mouth and a body hairy all over; they dress in cotton-wool and live only on the air they breathe and the scent they inhale through their nostrils; they have no food or drink except the different odours of the roots and flowers and wild apples, which they carry with them on their longer journeys so as not to lack a supply of scent; he says they can easily be killed by a rather stronger odour than usual. Beyond these in the most outlying mountain region we are told of the Three-span men and Pygmies, who do not exceed three spans, i.e. twenty-seven inches, in height; the climate is healthy and always spring-like, as it is protected on the north by a range of mountains; this tribe Homer has also recorded as being beset by cranes. It is reported that in springtime their entire band, mounted on the backs of rams and she-goats and armed with arrows, goes in a body down to the sea and eats the cranes eggs and chickens, and that this outing occupies three months; and that otherwise they could not protect themselves against the flocks of cranes that would grow up; and that their houses are made of mud and feathers and eggshells. Aristotle says that the Pygmies live in caves, but in the rest of his statement about them he agrees with the other authorities. The Indian race of Cyrni according to Isigonus live to 140; and he holds that the same is true of the Long-lived Ethiopians, the Chinese and the inhabitants of Mount Athosin the last case because of their diet of snakes' flesh, which causes their head and clothes to be free from creatures harmful to the body. Onesicritus says that in the parts of India where there are no shadows there are men five cubits and two spans a high, and people live a hundred and thirty years, and do not grow old but die middle-aged. Crates of Pergamum tells of Indians who exceed a hundred years, whom he calls Gymnetae, though many call them Longlivers. Ctesias says that a tribe among them called the Pandae, dwelling in the mountain valleys, live two hundred years, and have white hair in their youth that grows black in old age; whereas others do not exceed forty years, this tribe adjoining the Long-livers, whose women bear children only once. Agatharchides records this as well, and also that they live on locusts, and are very swift-footed. Clitarchus gave them the name of Mandi; and Megasthenes also assigns them three hundred villages, and says that the women bear children at the age of seven and old age comes at forty. Artemidorus says that

on the Island of Ceylon the people live very long lives without any loss of bodily activity. Duris says that some Indians have union with wild animals and the offspring is of mixed race and half animal; that among the Calingi, a tribe of the same part of India, women conceive at the age of five and do not live more than eight years, and that in another part men are born with a hairy tail and extremely swift, while others are entirely covered by their ears.

The river Arabis is the frontier between the Indians and the Oritae. These are acquainted with no other food but fish, which they cut to pieces with their nails and roast in the sun and thus make bread out of them, as is recorded by Clitarchus. Crates of Pergamum says that the Cavemen beyond Ethiopia are swifter than horses; also that there are Ethiopians more than twelve feet in height, and that this race is called the Syrbotae. The tribe of the Ethiopian nomads along the river Astragus towards the north called the Menismini is twenty days' journey from the Ocean; it lives on the milk of the animals that we call dog-headed apes, herds of which it keeps in pastures, killing the males except for the purpose of breeding. In the deserts of Africa ghosts of men suddenly meet the traveller and vanish in a moment.

These and similar varieties of the human race have been made by the ingenuity of Nature as toys for herself and marvels for us. And indeed who could possibly recount the various things she does every day and almost every hour? Let it suffice for the disclosure of her power to have included whole races of mankind among her marvels. From these we turn to a few admitted marvels in the case of the individual human being.

3. The birth of triplets is attested by the case of the Horatii and Curiatil; above that number is considered portentous, except in Egypt, where drinking the water of the Nile causes fecundity. Recently on the day of the obsequies of his late Majesty Augustus a certain woman of the lower orders named Fausta at Ostia was delivered of two male and two female infants, which unquestionably portended the food shortage that followed. We also find the case of a woman in the Peloponnese who four times produced quintuplets, the greater number of each birth surviving. In Egypt also Trogus alleges cases of seven infants born at a single birth.

Persons are also born of both sexes combined what we call Hermaphrodites, formerly called androgyni and considered as portents, but now as entertainments. Pompey the Great among the decorations of his theatre placed images of celebrated marvels, made with special elaboration for the purpose by the talent of eminent artists; among them we read of Eutychis who at Tralles was carried to her funeral pyre by twenty children and who had given birth 30 times, and Alcippe who gave birth to an elephantal though it is true that the latter case ranks among portents, for one of the first occurrences of the Marsian War was that a maidservant gave birth to a snake, and also monstrous births of various kinds are recorded among the ominous things that happened. Claudius Caesar writes that a hippo-centaur was born in Thessaly and died the same day; and in his reign we actually saw one that was brought here for him from Egypt preserved in honey. One case is that of an infant at Saguntum which at once went back into the womb, in the year [218 BC] in which that city was destroyed by Hannibal.

4. Transformation of females into males is not an idle story We find in the Annals that in the consulship [171 BC] of Publius Licinius Crassus and Gaius Cassius Longinus a girl at Casinum was changed into a boy, under the observation of the parents, and at the order of the augurs was conveyed away to a desert island. Licinius Mucianus has recorded that he personally saw at Argos a man named Arescon who had been given the name of Arescusa and had actually married a husband, and then had grown a beard and developed masculine attributes and had taken a wife; and that he had also seen a boy with the same record at Smyrna. I myself saw in Africa a person who had turned into a male on the day of marriage to a husband; this was Lucius Constitius, a citizen of Thysdritum....(It is said that) at the birth of twins neither the mother nor more than one of the two children usually lives. but that if twins are born that are of different sex it is even more unusual for either to be saved; that females are born more quickly than males, just as they grow older more quickly; and that movement in the womb is more frequent in the case of males, and males are usually carried on the right side, females on the left.

5. All the other animals have a fixed season both for copulation and for bearing offspring, but human reproduction takes place all the year round and the period of gestation variesin one case it may exceed six months, in another seven, and it may even exceed ten; a child born before the seventh month is usually still born. Only those conceived the day before or the day after full moon, or when there is no moon, are born in the seventh month. It is a common thing in Egypt for children to be born even in the eighth month; and indeed in Italy also for such cases to live, contrary to the belief of old times. These matters vary in more ways also. Vistilia the wife of Glitius and subsequently of Pomponius and of Orfitus, citizens of the highest distinction, bore these

husbands four children, in each case after six months' pregnancy, but subsequently gave birth to Suillius Rufus after ten months and Corbulo after sixboth of these became consulsand subsequently bore Caesonia, the consort of the Emperor Gaius, after seven months. Infants born in this number of months are weakest in health during the first six weeks, the mothers iu the fourth and eighth months of pregnancy; and abortions in these cases are fatal. Masurius states that Lucius Papirius as praetor in a suit for an estate brought by an heir presumptive gave judgement for the defendant; the plaintiff's case was that the heir apparent's mother said that he had been born after thirteen months' pregnancy, and the ground for the judgement was that there appeared to be no fixed period of pregnancy.

6. On the tenth day from conception pains in the head, giddiness and dim sight, distaste for food, and vomiting are symptoms of the formation of the embryo. If the child is a male, the mother has a better colour and an easier delivery; there is movement in the womb on the fortieth day. In a case of the other sex all the symptoms are the opposite: the burden is hard to carry, there is a slight swelling of the legs and groin, but the first movement is on the ninetieth day. But in the case of both sexes the greatest amount of faintness occurs when the embryo begins to grow hair; and also at the full moon, which period is also specially inimical to infants after birth. The gait in walking and every thing that can be mentioned are so important during pregnancy that mothers eating food that is too salt bear children lacking nails, and that not holding the breath makes the delivery more difficult; indeed, to gape during delivery may cause death, just as a sneeze following copulation causes abortion.

7. One feels pity and even shame in realizing how trivial is the origin of the proudest of the animals, when the smell of lamps being put out usually causes abortion! These are the beginnings from which are born tyrants and the pride that deals slaughter. You who put confidence in your bodily strength, you who accept fortune's bounty and deem yourself not even her nurseling but her offspring, you whose thoughts are of empire, you who when swelling with some success believe yourself a god, could you have been made away with so cheaply? and even today you can be more cheaply, from being bitten by a snake's tiny tooth, or even choked by a raisin-stone like the poet Anacreon, or by a single hair in a draught of milk, like the praetor Fabius Senator. Assuredly only he who always remembers how frail a thing man is will weigh life in an impartial balance!

8. It is against nature to be born feet foremost: this is the reason why the designation of 'Agrippa' has been applied to persons so bornmeaning 'born with difficulty' [aegre partus]: Marcus Agrippa is said to have been born in this manner, almost the solitary instance of a successful career among all those so bornalthough he too is deemed to have paid the penalty which his irregular birth foretold, by a youth made unhappy by lameness, a lifetime passed amidst warfare and ever exposed to the approach of death, by the misfortune caused to the world by his whole progeny but especially due to his two daughters a who became the mothers of the emperors Gaius Caligula and Domitius Nero, the two firebrands of mankind; and also by the shortness of his life, as he was cut off at the age of fifty during the agony caused him by his wife's adulteries and during his irksome subjection to his father-inlaw Augustus. Nero also, who was emperor shortly before and whose entire rule showed him the enemy of mankind, is stated in his mother Agrippina's memoirs to have been born feet first. It is Nature's method for a human being to be born head first, and it is the custom for him to be carried to burial feet first.

9. It is a better omen when the mother dies in giving birth to the child; instances are the birth of the elder Scipio Africanus and of the first of the Caesars, who got that name from the surgical operation performed on his mother; the origin of the family name Caeso is also the same. Also Manilius who entered Carthage with his army was born in the same manner.

10. The name Vopiscus used to be given to cases of a twin born after being retained in the womb when the other twin had been killed by premature deliveryfor extremely remarkable though infrequent cases of this occur.

11. Few animals except woman ever have sexual intercourse when pregnantat all events superfetation only occurs with animals in very few cases. In the records of the medical profession and of writers who have been interested in collecting such occurrences, there is a case of miscarriage in which twelve infants were stillborn at once. When, however, a moderate interval of time separates two conceptions, both may be successful, as was seen in the instance of Hercules and his brother Iphicles and in the case of the woman who bore twins of whom one resembled her husband and the other an adulterer: and also in that of the maidservant of Marmara who, as a result of intercourse on the same day, bore one twin resembling her master and another resembling his steward, and that of another woman who bore one twin at the proper period and the other a five-months' child, and again of another who after bearing a seven months' child was delivered of twins three months later.

It is also well known that sound parents may have deformed children and deformed parents sound children or children with the same deformity, as the case may be; that some marks and moles and even scars reappear in the offspring, in some cases a birth-mark on the arm reappearing in the fourth generation

12. (we are told that in the Lepidus family three children were born, though not all in succession, with a membrane over the eyes); and indeed that other children have resembled their grandfather, and that also there has been a case of twins of which one resembled the father and the other the mother, and one of a child who resembled his brother like a twin although born a year later. Also that some women always bear children like themselves, some bear children like their husbands, some children with no family likeness, some female child like its father and a male child like themselves. One unquestioned instance is that of the famous boxer Nicaeus, born at Istamboul, whose mother was the offspring of adultery with an Ethiopian but had a complexion no different from that of other women, whereas Nicaeus himself reproduced his Ethiopian grandfather. Cases of likeness are indeed an extremely wide subject, and

one which includes the belief that a great many accidental circumstances are influential recollections of sights and sounds and actual sense-impressions received at the time of conception. Also a thought suddenly flitting across the mind of either parent is supposed to produce likeness or to cause a combination of features, and the reason why there are more differences in man than in all the other animals is that his swiftness of thought and quickness of mind and variety of mental character impress a great diversity of patterns, whereas the minds of the other animals are sluggish, and are alike for all and sundry, each in their own kind. A man of low station named Artemo so closely resembled Antiochus [III, 223-187 BC], king of Syria, that the royal consort Laodice after she had murdered Antiochus successfully made use of him to stage a play of her being recommended for succession to the throne. Pompey the Great had two doubles almost indistinguishable from him in appearance, a plebeian named Vibius and one Publicius who was actually a liberated slave, both of whom reproduced that noble countenance and the actual dignity of his magnificent brow. A similar resemblance was the reason that saddled Pompey's father also with the surname Menogenes, that being the name of his cook, when he already had the surname Strabo [cross-eyed] from the appearance of his eyes, which actually copied a defect in his slave; and a Scipio received the surname Serapio in a similar way. Serapio being a low chattel belonging to a dealer in hogs. Another Scipio of a later generation received his name from an actor Salutio, just as Spinther and Pamphilus who played second and third roles respectively gave their names to the colleagues in the consulship Lentulus and Metellus, a situation which also (most inappropriately) resulted incidentally in the counterfeit presentations of two consuls being seen on the stage at once. Vice versa, Lucius Plancus an orator gave a surname to a player Rubrius, whereas Burbuleius gave his name to Curio senior and likewise Menogenes to the former censor Messala, both alike being actors. A fisherman in Sicily not only resembled the proconsul Sara in appearance but actually reproduced his gape while speaking and his tongue-tied stammering utterance. The famous orator Cassius Severus was taunted for his likeness to the gladiator Armentarius. Recently in the household of Annaeus people used to mistake Gallio for the freedman Castellanus and the senator Agrippinus for the actor Sannius, surnamed Paris. The slave-dealer Toranius sold to Antony after he had become one of the triumvirate two exceptionally handsome boys, who were so identically alike that he passed them off as twins, although one was a native of Asia and the other of a district North of the Alps. Later the boys' speech disclosed the fraud, and a protest was made to the dealer by the wrathful Antony, who complained especially about the large amount of the price (he had bought them for 200,000 sesterces); but the crafty dealer replied that the thing protested about was precisely the cause of his having charged so much, because there was nothing remarkable in a likeness between any pair of twin brothers, whereas (he said) to find natives of different races so precisely alike in appearance was something above all appraisal; and this produced in Antony so convenient a feeling of admiration that the great inflictor of outlawry, who had just been in a fury of threats and abuse, considered that no other property that he possessed was more suited to his station!

13. Particular individuals may have a certain physical incongruity between them, and persons whose union is infertile may have children when they form other connexionsfor instance Augustus and Livia, and similarly others. Also some women have only female or only male children, though usually the sexes come alternatelyfor instance in the case of the mother of the Gracchi this occurred twelve times, and in that of Germanicus's wife Agrippina nine times; some women are childless in youth; on some parentage is bestowed once in a lifetime; certain women are always delivered prematurely, and those of this class, if ever they

succeed in overcoming this tendency by the use of drugs, usually bear a female child. One of the many exceptional circumstances connected with his late Majesty Augustus is that he lived to see his daughter's grandson, Marcus Silanus, who was born in the year of his death; Silanus, after succeeding the emperor Nero as consul, held the province of Asia, and during his office Nero despatched him by poison. Quintus Metellus Macedonicus, leaving six children, left eleven grandchildren, but including daughters-in-law and sons-in-law the total of those who greeted him by the title of father was twenty-seven. In the annals of the period of his late Majesty Augustus is found a statement that in his twelfth consnlship, [4 BC] when Lucius Sulla was his colleague, on the 9th April a freeman of humble station at Fiesole named Gaius Crispinius Hilarus went in procession preceded by eight children, including two daughters, twenty-seven grandchildren, eighteen great-grandchildren, and eight granddaughters by marriage, and with all of these attendance offered sacrifice on the Capitol.

14. A woman does not bear children after the age of fifty, and with the majority menstruation ceases at 40. As for the case of men, it is well known that King Masinissa begot a son when over 86, whom he called Methimannus, and Cato the excensor had a son by the daughter of his client Salonius when he was 81: this is the reason why this branch of his family bears the surname of Salonianus, although that of the other branch is Licinianus; Cato of Utica belonged to the Salonian branch. Recently also Lucius Volusins Saturninus, who died while holding the office of City Praefect, is known to have had a son, by Cornelia of the Scipio family, born after he was 62, Volusius Saturninus, who was consul. Parentage even up to the age of 75 is commonly found in the lower classes.

15. Woman is, however, the only animal that has monthly periods; consequently she alone has what are called moles in her womb. This mole is a shapeless and inanimate mass of flesh that resists the point and the edge of a knife; it moves about, and it checks menstruation, as it also checks births: in some cases causing death, in others growing old with the patient, sometimes when the bowels are violently moved being ejected. A similar object is also formed in the stomach of males, called a tumour, as in the case of the praetorian Oppius Gapito, But nothing could easily be found that is more remarkable than the monthly flux of women. Contact with it turns new wine sour, crops touched by it become barren, grafts die, seeds in gardens are dried up, the fruit of trees falls off, the bright surface of mirrors in which it is merely reflected is dimmed, the edge of steel and the gleam of ivory are dulled, hives of bees die, even bronze and iron are at once seized by rust, and a horrible smell fills the air: to taste it drives dogs mad and infects their bites with an incurable poison. Moreover bitumen, a substance generally sticky and viscous, that at a certain season of the year floats on the surface of the lake of Judaea called the Asphalt Pool [Dead Sea], adheres to everything touching it, and cannot be drawn asunder except by a thread soaked in the poisonous fluid in question. Even that very tiny creature the ant is said to be sensitive to it, and throws away grains of corn that taste of it and does not touch them again. Not only does this pernicious mischief occur in a woman every month, but it comes in larger quantity every three months: and in some cases it comes more frequently than once a month, just as in certain women it never occurs at all. The latter, however, do not have children, since the substance in question is the material for human generation, as the semen from the males acting like rennet collects this substance within it, which thereupon immediately is inspired with life and endowed with body. Hence when this flux occurs with women heavy with child, the offspring is sickly or still-born or sanious, according to Nigidius.

16. (The same writer holds that a woman's milk does not go bad while she is suckling a baby if she has become pregnant again from the same male.) It is stated, however, that the easiest conceptions are when this condition is beginning or ceasing. We have it recorded as a sure sign of fertility in women if when the eyes have been anointed with a drug the saliva contains traces of it.

Moreover, it is known that children cut their first teeth when six months old, the upper ones mostly coming first, and that the first teeth fall out and are replaced by others when they are six years old; and that some children are born having teethtwo distinguished instances are Manius Curius, who received the surname Dentatus in consequence, and Gnaeus Papirius Carbo. In the regal period this occurrence was considered a sign of bad luck in females; Valeria was born with teeth, and the soothsayers in reply to inquiry prophesied that she would bring disaster to any community to which she was taken; she was deported to Suessa Pometia, at that period a very flourishing place, the eventual result verifying the oracle. (Some females are born with the genitals closed; this is proved by the ease of Cornelia the mother of the Graechi to be a sign of bad luck.) Some infants are born with a ridge of bone instead of teeth; this was the case as regards the upper jaw with the son of Prusias, King of Bithynia. The teeth are so far indestructible by fire as not to burn when the rest of the body is cremated, but although they resist fire they are corroded by

a morbid state of the saliva. A certain drug gives them whiteness. Use wears them down, and in some people they decay much before this. Nor are they only necessary for food and nourishment, as the front teeth regulate the voice and speech, meeting the impact of the tongue with a kind of harmony, and according to their regularity of arrangement and size clipping or modulating or else dulling the words, and when they are lost preventing all clear articulation. Moreover this part of the body is believed to possess prophetic powers. Males (excepting the Turduli tribe) have 32 teeth; there have been cases of men with morethis is thought to foretell a longer term of life. Women have fewer; with them two dogteeth on the right side of the upper jaw are a promise of fortune's favours. as in the case of Domitius Nero's mother Agrippina; on the left side the opposite.(It is the universal custom of mankind not to cremate a person who dies before cutting his teeth.)But more of this later when our researches go through the parts of the body seriatim.

It is recorded of only one person, Zoroaster, that he laughed on the same day on which he was born, and also that his brain throbbed so violently as to dislodge a hand placed on his headthis foretelling his future knowledge.

It is known that at the age of three a person's measurement is half his future stature. But it is almost a matter of observation that with the entire human race the stature on the whole is becoming smaller daily, and that few men are taller than their fathers, as the conflagration that is the crisis towards which the age is now verging is exhausting the fertility of the semen. When a mountain in Crete was cleft by an earthquake a body 69 feet in height was found, which some people thought must be that of Orion and others of Otus. The records attest that the body of Orestes dug up at the command of an oracle measured 10 ft. 6 in. Moreover, the famous bard Homer nearly 1000 years ago never ceased to lament that mortals were smaller of stature than in he old days. In the case of Naevius Pollio the annals do not record his height, but they show that was deemed portentous, because he was almost killed by the people flocking round him. The tallest person our age has seen was a man named Gabbara brought from Arabia in the principate of his late Majesty Claudius who was 9 ft. 9 in. in height. Under his late Majesty Augustus there were two persons 6 in. taller, whose bodies on account of this remarkable height were preserved in the tomb in Sallust's Gardens; their names were Pusio and Secundilla. When the same emperor was head of the state the smallest person was a dwarf 2 ft. 5 in. high named Conopas, the pet of his granddaughter Julia, and the smallest female was Andromeda, a freed-woman of Julia Augusta, Marcus Varro states that the Knights of Rome Manius Maximus and Marcus Tullius were 3 ft. high, and we have ourselves men their bodies preserved in coffins. It is a matter of common knowledge that persons are born 18 in. high and some taller, who complete their life's course at the age of three.

We find in the records that at Salamis the son of Euthymenes grew to 4 ft. 6 in. in his third year; he walked slowly, was dull of sense, became sexually quite mature, had a bass voice, and was carried off by a sudden attack of paralysis when he turned three. We ourselves recently saw almost all these features except sexual maturity in a son of the Knight of Rome Cornelius Tacitus, Deputy Finance Minister in Belgic Gaul. The Greeks call these cases 'perverts,' but in the Latin country there is no name for them.

17. It has been noticed that a man's height from head to foot is equal to his full span measured from the tips of the middle fingers; likewise that the right-hand side of the frame is the stronger, though in some cases both sides are equally strong and there are people whose left side is the stronger, though this is never the case with women; and that males are the heavier; and that the bodies of all creatures are heavier when dead than when alive, and when asleep than when awake; and that me's corpses float on their backs, but women's on their faces, as if nature spared their modesty after death.

18. Cases are recorded of persons living whose bones were solid and without marrow; and we are told that their distinguishing mark is insensibility to thirst and absence of perspiration, although we know that thirst can also be subdued by the will, and that a Knight of Rome of the allied tribe of the Vocontil named Julius Viator, suffering from dropsy when a minor, was forbidden liquid by the doctors and habituated himself to defeat nature, going without drink till old age. Moreover other persons also have exercised many kinds of self-control.

19. It is stated that Crassus the grandfather of Crassus who fell in Parthia never laughed, and was consequently called Agelastus, and that likewise there have been many cases of people who never wept, and that the famous philosopher Socrates always wore the same look on his countenance, never gayer and never more perturbed. This temperament sometimes develops into a kind of rigidity and a hard, unbending severity of nature, and takes away the emotions natural to humanity; persons of this sort are called 'apathetic' by the Greeks, who have known many men of the kind, and among them surprising to say, chiefly founders of schools of philosophy, Diogenes the Cynic, Pyrrho, Herachtus, Timothe

Copyright © 2018 by Lord Henfield, Guildford Scientific Press PAGE 3461 last indeed going as far as to hate the whole human race. But these small peculiarities of nature are known to occur variously in many persons, for instance in the case of Drusus's daughter Antonia never spitting, in the poet and ex-consul Pomponius never belching. Persons whose bones are by nature solid, a rather rare class, are called 'horny.'

20. Varro in his account of cases of remarkable strength records that one Tritanus, famous in the gladiatorial exercise with the Samnite equipment, was slightly built but of exceptional strength, and that his son, a soldier of Pompey the Great, had a chequered crisscross of sinews all over his body, even in his arms and hands; and moreover that once he challenged one of the enemy to single combat, defeated him without a weapon in his hand, and finally took hold of him with a single finger and carried him off to the camp. Vinnius Valens served as captain in the Imperial Guard of the late lamented Augustus; he was in the habit of holding carts laden with wine-sacks up in the air until they were emptied, and of catching hold of wagons with one hand and stopping them by throwing his weight against the efforts of the teams drawing them, and doing other marvellous exploits which can be seen carved on his monument. Marcus Varro likewise states: 'Rusticelius, who was nicknamed Hercules, used to lift his mule; Fufius Salvius used to walk up a ladder with two hundred pound weights fastened to his feet, the same weights in his hands and two two-hundred-pound weights on his shoulders.' We also saw a man named Athanatus, who was capable of a miraculous display: he walked across the stage wearing a leaden breast-plate weighing 500 pounds and shod in boots of 500 pounds' weight. When the athlete Milo took a firm stand, no one could make him shift his footing, and when he was holding an apple no one could make him straighten out a finger.

Phidippides's running the 130 miles from Athens to Sparta in two days was a mighty feat, until the Spartan runner Anystis and Alexander the Great's courier Philonides ran the 148 miles from Sicyon to This in a day. At the present day indeed we are aware that some men can last out 128 miles in the circus, and that recently in the consulship of Fonteius and Vipstanus a boy of 8 ran 68 miles between noon and evening. The marvellous nature of this feat will only get across to us in full measure if we reflect that Tiberius Nero completed by carriage the longest twenty-four hours' journey on record when hastening to Germany to his brother Drusus who was ill: this measured 182 miles.

21. Keenness of sight has achieved instances transcending belief in the highest degree. Cicero records that a parchment copy of Homer's poem The Iliad was enclosed in a nutshell. He also records a case of a man who could see 123 miles. Marcus Varro also gives this man's name, which was Strabo, and states that in the Punic wars he was in the habit of telling from the promontory of Lilybaeum in Sicily the actual number of ships in a fleet that was passing out from the harbour of Carthage. Callicrates used to make such small ivory models of ants and other creatures that to anybody else their parts were invisible. A certain Myrmecides won fame in the same department by making a four-horse chariot of the same material that a fly's wings.

22. There is one marvellous instance of the transmission of a spoken message: the battle that resulted in the destruction of Sybaris was heard of at Olympia on the day on which it was fought. For the messengers who brought news of the victory over the Cimbri and the brothers Castor who reported the victory over Perseus to the Romans on the very day on which it happened were visions and warnings sent by the divine powers.

23. Bodily endurance, so fertile of disasters is fate, has produced countless examples, the most famous in the case of women being that of the harlot Leaena who on the rack refused to betray the tyrannicides Harmodius and Aristogiton, and among men that of Anaxarchus, who when being tortured for a similar reason bit off his tongue and spat the only hope of betraval in the tyrant's face.

24. As to memory, the boon most necessary for life, it is not easy to say who most excelled in it, so morning, many men having gained renown for it. King Cyrus could give their names to all the soldiers in his army, Lucius Scipio knew the names of the whole Roman people, King Pyrrhus's envoy Cineas knew those of the senate and knighthood at Rome the day after his arrival. Mithridates who was king of twenty-two races gave judgements in as many languages, in an assembly addressing each race in turn without an interpreter. A person in Greece named Charmadas recited the contents of any volumes in libraries that anyone asked him to quote, just as if he were reading them. Finally, a memoria technica was constructed, which was invented by the lyric poet Simonides and perfected by Metrodorus of Seepsis, enabling anything heard to be repeated in the identical words. Also no other human faculty is equally fragile: injuries from, and even apprehensions of, diseases and accident may affect in some cases a single field of memory and in others the whole. A man has been known when struck by a stone to forget how to read and write but nothing else. One who fell from a very high roof forgot his mother and his relatives and friends, another when ill forgot his servants also; the orator Messala Corvinus forgot his own name. Similarly tentative and hesitating lapses of memory often occur when the body even when uninjured is in repose; also the gradual approach of sleep curtails the memory and makes the unoccupied mind wonder where it is.

25. The most outstanding instance of innate mental vigour I take to be the dictator Caesar; and I am not now thinking of valour and resolution, nor of a loftiness embracing all the contents of the firmament of heaven, but of native vigour and quickness winged as it were with fire. We are told that he used to write or read and dictate or listen simultaneously, and to dictate to his secretaries four letters at once on his important affairsor, if otherwise unoccupied, seven letters at once. He also fought fifty pitched battles, and alone beat the record of Marcus Marcellus who fought thirty-ninefor I would not myself count it to his glory that in addition to conquering his fellow-citizens he killed in his battles 1,192,000 human beings, a prodigious even if unavoidable wrong indicted on the human race, as he himself confessed it to be by not publishing the casualties of the civil wars.

It would be more just to credit Pompey the Great with the 846 ships that he captured from the pirates; while to Caesar let us assign, in addition to the facts mentioned above, the peculiar distinction of the clemency in which (even to the point of subsequent regret) he surpassed all men; also he afforded an example of magnanimity that no other can parallel. For while to count under this head the shows that he gave and the wealth that he squandered, or the magnificence of his public works, would display indulgence to luxury, it showed the genuine and unrivalled sublimity of an unconquered spirit that, when Pompey the Great's despatch cases were captured at Pharsalia and again those of Scipio at Thapsus, he scrupulously burnt them and did not read them.

26. But it concerns the glory of the Roman Empire, and not that of one man, to mention in this place all the records of the victories of Pompey the Great and all his triumphs, which equal the brilliance of the exploits not only of Alexander the Great but even almost of Hercules and Father Liber. Well then, after the recovery of Sicily, which inaugurated his emergence as a champion of the commonwealth in the party of Sulla, and after the conquest of the whole of Africa and its reduction under our sway, and the acquirement as a trophy therefrom of the title of The Great, he rode back in a triumphal chariot though only of equestrian rank, a thing which had never occurred before; and immediately afterwards he crossed over to the West, and after erecting trophies in the Pyrenees he added to the record of his victorious career the reduction under our sway of 876 towns from the Alps to the frontiers of Further Spain, and with greater magnanimity refrained from mentioning Sertorius, and after crushing the civil war which threatened to stir up all our foreign relations, a second time led into Rome a procession of triumphal chariots as a Knight, having twice been commander-in-chief before having ever served in the ranks. Subsequently he was despatched to the whole of the seas and then to the far east, and he brought back titles without limit for his country, after the manner of those who conquer in the sacred contests before these are not crowned with wreaths themselves but crown their native land; consequently he bestowed these honours on the city in the shrine of Minerva that he was dedicating out of the proceeds of the spoils of war:

Gnaeus Pompeius Magnus, Commander in Chief, having completed a thirty years' war, routed, scattered, slain or received the surrender of 12,183,000 people, sunk or taken 846 ships, received the capitulation of 1538 towns and forts, subdued the lands from the Maeotians to the Red Sea, duly dedicates his offering vowed to Minerva.

This is his summary of his exploits in the east. But the announcement of the triumphal procession that he led on September 28 in the consulship of Marcus Piso and Marcus Messala was as follows:

After having rescued the sea coast from pirates and restored to the Roman People the command of the sea, he celebrated a triumph over Asia, Pontus, Armenia, Paphlagonia, Cappadocia, Cicilia, Syria, the Scythians, Jews and Albanians, Iberia, the Island of Crete, the Basternae, and, in addition to these, over King Mithridates and Tigranes.

The crowning pinnacle of this glorious record was (as he himself declared in assembly when discoursing on his achievements) to have found Asia the remotest of the provinces and then to have made her a central dominion of his country. If anybody on the other side desires to review in similar manner the achievements of Caesar, who showed himself greater than Pompey, he must assuredly roll off the entire world, and this it will be agreed is a task without limit.

27. There have been various and numerous cases of eminence in the other kinds of excellence. Cato the first of that name in the Gens Porcia is deemed to have exemplified the three supreme human achievements, excelling alike as orator, as general and as senator; all of which distinctions seem to me to have been achieved though not previously yet with greater brilliance in the case of Scipio Aemilianus, and that moreover without the very wide unpopularity that handicapped Cato.

So it may be counted an exceptional fact about Cato that he took part in forty-four actions at law and was sued more frequently than anybody else and always acquitted.

28. What person has possessed the most outstanding courage is a subject of unending enquiry, at all events if the legendary testimony of poetry be accepted. Quintus Ennius had a particular admiration for Titus Caecilius Teucer and his brother, adding Book 16 to his Annals on their account. Lucius Siccius Dentatus, Tribune of the Plebs in the consulship of Spurius Tarpeius and Aulus Aternius not long after the expulsion of the kings, scores an exceedingly large number of votes, as having fought in 120 battles, been challenged to and having won eight single combats, and having the distinction of 45 scars in front and none at all on his back. He also captured spoils 34 times, had bestowed upon him 18 spear-shafts, 25 breast-badges, 83 necklets, 160 bracelets, 26 crowns (including 14 civic crowns, eight of gold, three mural crowns, one siege-rescue crown), a bag of money, ten prisoners of war and with them 20 cows; also he followed in the triumphs of nine generals whose victories were chiefly due to his aid, and in additionand this in my opinion is his finest achievementprocured the conviction in the People's Court at the termination of his consulship of one of his leaders Titus Romilius on the charge of maladministration of his office. The military distinctions of Capitolinus would be not inferior, if he had not cancelled them by the conclusion of his career. He had twice captured enemy's spoils before he was seventeen years old; he had been the first of any one to receive a mural crown as a Knight, as well as six civic crowns and 37 gifts; he had received 23 wounds on the front of his body; he had rescued Publius Servilius Master of the Horse, when himself wounded in the shoulder and thigh; above all he had alone saved the Capitol and the fortunes of the state therein from the Gaulsif only he had not saved it to make himself king.

But, although these cases exhibit great achievements of valour, yet they involve still greater achievements of fortune; whereas nobody, in my judgement at all events, can rightly rank any human being above Marcus Sergius, albeit his greatgrandson Catiline diminishes the credit of his name. Sergius in his second campaign lost his right hand; in two campaigns he was wounded twenty-three times, with the result that he was crippled in both hands and both feet, only his spirit being intact; yet although disabled, he served in numerous subsequent campaigns. He was twice taken prisoner by Hannibal (for it was with no ordinary foe that he was engaged), and twice escaped from Hannibal's fetters, although he was kept in chains or shackles on every single day for twenty months. He fought four times with only his left hand. having two horses he was riding stabbed under him. He had a right hand of iron made for him and going into action with it tied to his arm, raised the siege of Cremona, saved Piacenza, captured twelve enemy camps in Gaul: all of which exploits are testified by his speech delivered during his praetorship when his colleagues wanted to debar him from the sacrifices as infirma man who with a different foe would have accumulated what piles of wreaths! inasmuch as it makes the greatest difference with what period of history a particular man's valour happens to coincide. What civic wreaths were bestowed by Trebbia or Ticino or Trasimeno? what crown was won at Cannae, where successful flight was valour's highest exploit? All other victors truly have conquered men, but Sergius vanguished fortune also.

29. Who could make an honours class-list of geniuses, ranging through all the kinds of systems and all the varieties of subject and of treatment? unless perhaps it is agreed that no genius has ever existed who was more successful than Homer the bard of Greece, whether he be judged by the form or by the matter of his work. Consequently Alexander the Greatfor so lordly an assessment will be effected best and least invidiously by the most supreme tribunalswhen among the booty won from the Persian King Darius there was a case of unguents made of gold and enriched with pearls and precious stones, and when his friends pointed out the various uses to which it could be put, since a warrior soiled with warfare had no use for perfume, said, 'No, by Hercules, rather let it be assigned to keeping the works of Homer'so that the most precious achievement of the mind of man might be preserved in the richest possible product of the craftsman's art. Alexander also gave orders at the sack of Thebes for the household and home of the poet Pindar to be spared; and he felt the native place of the philosopher Aristotle to be his own, and blended that evidence of kindliness with all the glory of his exploits. Apollo at Delphi exposed the murderers of the poet Archilochus. When Sophocles the prince of the tragic buskin died [406 BC] Father Liber gave orders for his burial though the Spartans were besieging the city walls, the Spartan king Lysander receiving frequent admonitions in dreams 'to permit the interment of the darling of the god. The king enquired what persons had expired at Athens and had no difficulty in understanding which among them the god meant, and he granted an armistice for the funeral.

30. The tyrant Dionysius, who was in other matters by nature given to cruelty and pride, sent a ship decked with garlands to meet Plato the high priest of wisdom, and as he

disembarked received him at the coast in person, in a chariot with four white horses. Isocrates sold a single speech for 20 talents. The eminent Athenian orator Aeschines, after reading to the citizens of Rhodes the speech that he had made in prosecuting, also read Demosthenes's speech in defence that had driven him into exile at Rhodes, and on their expressing admiration said hat they would have admired it even more on the actual occasion, if they had heard the orator himself: thus his disaster constituted him a powerful witness for his enemy's case. Thucydides as military commander was sentenced to exile by the Athenians but as historian was recalled: they admired the eloquence of a man whose valour they had condemned. High testimony was also born to Menander's eminence in comedy by the kings of Egypt and Macedon when they sent a fleet and an embassy to fetch him, but higher testimony was derived from himself by his preferment of the consciousness of literary merit to royal fortune.

Roman leaders also have borne witness even to foreigners. At the conclusion of the war with Mithridates Gnaeus Pompey when going to enter the abode of the famous professor of philosophy Posidonius forbade his retainer to knock on the door in the customary manner, and the subduer of the East and of the West dipped his standard to the portals of learning. Cato the censor, on the occasion when the famous embassy of the three leaders of philosophy was sent from Athens, after hearing Carneades advised that these envoys should be sent away as soon as possible, because when Carneades was discoursing it was difficult to distinguish where the truth lay. What a complete change of fashion! The Cato in question always on other occasions recommended the total banishment of Greeks from Italy, whereas his greatgrandson Cato of Utica brought home one from his military tribunate and another from his mission to Cyprus; and of the two Catos the former has the distinction of having banished and the other of having introduced the same language.

But let us also pass in review the glory of our own countrymen. The elder Africanus gave orders for a statue of Quintus Ennius to be placed on his own tomb, and for that famous name, or rather trophy of war won from a third part of the world, to be read above his last ashes together with the memorial of a poet. His late Majesty Augustus overrode the modesty of Virgil's will and forbade the burning of his poems. and thus the bard achieved a stronger testimony than if he had commended his own works himself. In the library founded at Rome by Asinius Pollio, the earliest library in the world established out of the spoils of war, the only statue of a living person erected was that of Marcus Varro, the bestowal by a leading orator and citizen of this crowning honour on one only out of the multitude of men of genius then existing constituting no less a distinction, in my own opinion, than when Pompey the Great gave to that same Varro a naval crown for his conduct in the war with the pirates. There is a countless series of Roman examples, if one chose to pursue them, since a single race has produced more men of distinction in every branch whatever than the whole of the other countries. But what excuse could I have for omitting mention of you, Marcus Tullius? or by what distinctive mark can I advertise your superlative excellence? by what in preference to the most honourable testimony of that whole nation's decree, selecting out of your entire life only the achievements of your consulship? Your oratory induced the tribes to discard the agrarian law, that is, their own livelihood; your advice led them to forgive Roscius the proposer of the law as to the theatre, and to tolerate with equanimity the mark put upon them by a distinction of seating; your entreaty made the children of the men sentenced to proscription ashamed to stand for office; your genius drove Catiline to flight; you proscribed Mark Antony. Hail, first recipient of the title of Father of the Country, first winner of a civilian triumph and of a wreath of honour for oratory, and parent of eloquence and of Latium's letters; and (as your former foe, the dictator Caesar, wrote of you) winner of a greater laurel wreath than that of any triumph, inasmuch as it is a greater thing to have advanced so far the frontiers of the Roman genius than the frontiers of Rome's empire.

31. Persons who have surpassed the rest of mortal kind in the remaining gifts of the mind are: in wisdom, the people who on this account won at Rome the surnames of Wise and Sage, and in Greece Socrates, whom Pythian Apollo's oracle placed before all other men.

32. Again, partnership with the oracles was bestowed by mortals on the Spartan Chilo, by canonizing in letters of gold at Delphi his three precepts, which are these: Know thyself; Desire nothing too much; The comrade of debt and litigation is misery. Moreover when he expired from joy on his son's being victorious at Olympia, the whole of Greece followed in his funeral procession.

33. The most famous instances of the gift of divination and so to speak communion with the heavenly beings are, among women, the Sibyl, and among men, Melampus in Greece and Marcius at Rome.

34. Scipio Nasica was judged by the verdict of the senate on oath to be once for all the noblest man since the foundation of time, although he was twice branded by the nation with defeat

when a candidate for office. At the end he was not permitted to die in his native land, any more in truth than the great Socrates, whom Apollo judged to be the wisest of mankind, was allowed to die freed from fetters.

35. The first case of a woman judged by the vote of the matrons to be the most modest was Sulpicia, a daughter of Paterculus and wife of Fulvius Flaccus, who was elected from a previously chosen list of 100 to dedicate the image of Venus in accordance with the Sibylline books; and on a second occasion, by the test of religion, Claudia, when the Mother of the Gods was brought to Rome.

36. Of filial affection there have it is true been unlimited instances all over the world, but one at Rome with which the whole of the rest could not compare. A plebeian woman of low position and therefore unknown, who had just given birth to a child, had permission to visit her mother who had been shut up in prison as a punishment, and was always searched in advance by the doorkeeper to prevent her carrying in any food; she was detected giving her mother sustenance from her own breasts. In consequence of this marvel the daughter's pious affection was rewarded by the mother's release and both were awarded maintenance for life; and the place where it occurred was consecrated to the Goddess concerned, a temple dedicated to Filial Affection being built on the site of the prison, where the Theatre of Marcellus now stands, in the consulship of Gaius Quinctius and Manius Acilius. In the house of the father of the Gracchi two snakes were caught, and in reply to enquiry an oracle declared that he himself would live if the snake of the other sex were killed; "No," said he, "kill my snake: Cornelia is young and still able to bear children." This meant, to spare his wife and think of the public interest; and the result prophesied soon followed. Marcus Lepidus after divorcing his wife Appuleia died for love of her. Publius Rutilius when suffering from a slight illness received news of his brother's defeat in his candidature for the consulship, and at once expired. Publius Catienus Philotimus loved his patron so dearly that he threw himself upon his funeral pyre, although left heir to the whole of his property

37. The people who have achieved distinction in the knowledge of the various sciences are innumerable, but nevertheless they must be touched on when we are culling the flower of mankind: in astronomy, Berosus, to whom on account of his marvellous predictions Athens officially erected in he exercising ground a statue with a gilt tongue; philology, Apollodorus, whom the Amphictyons of Greece honoured; in medicine, Hippocrates, who foretold a plague that was coming from Illyria and despatched his pupils round the cities to render assistance, in return for which service Greece voted him the honours that it gave to Hercules. The same knowledge in the case of Cleombrotus of Ceos was rewarded by King Ptolemy at the Megalensian Festival with 100 talents, after he had saved the life of King Antiochus. Critobulus also has a great reputation for having extracted an arrow from King Philip's eve, and having treated his loss of sight without causing disfigurement of his face; but the highest reputation belongs to Asclepiades of Prusa, for having founded a new school, despised the envoys and overtures of King Mithridates, discovered a method of preparing medicated wine for the sick, brought back a man from burial and saved his life, but most of all for having made a wager with fortune that he should not be deemed a physician if he were ever in any way ill himself: and he won his bet, as he lost his life in extreme old age by falling downstairs.

Archimedes also received striking testimony to his knowledge of geometry and mechanics from Marcus Marcellus, who at the capture of Syracuse forbade violence to be done to him onlyhad not the ignorance of a soldier foiled the command. Others who won praise were Chersiphron of Gnossus who constructed the wonderful temple of Diana at Ephesus, Philo who made a dockyard for 400 ships at Athens, Ctesibius who discovered the theory of the pneumatic pump and invented hydraulic engines, Dinochares who acted as surveyor for Alexander when founding Alexandria in Egypt. This ruler also issued a proclamation that only Apelles should paint his picture, only Pyrgoteles sculpture his statue, and only Lysippus cast him in bronze: there are many celebrated examples of these arts.

38. King Attalus bid 100 talents for one picture by the Theban painter Aristides; the dictator Caesar purchased two by Timomachus for 80, the Medea and the Ajax, to dedicate them in the temple of Venus Genetrix. King Candaules paid its weight in gold for a picture of considerable size by Bularchus representing the downfall of the Magnesians. King Demetrius surnamed Besieger of Cities refrained from setting fire to Rhodes for fear of burning a picture by Protogenes stored in that part of the fortification. Praxiteles is famous for his marbles, and especially for his Venus at Cnidos, which is celebrated because of the infatuation that it inspired in a certain young man, and because of the value set on it by King Nicomedes, who attempted to obtain it in return for discharging a large debt owed by the Cnidians. Daily testimony is borne to Phidias by Olympian Jove, and to

Mentor by Capitoline Jove and by Diana of Ephesus, works that have immortalized the tools of this craft.

39. The highest price hitherto paid, so far as I have ascertained, for a person born in slavery was when Attius of Pesaro was selling a skilled linguist named Daphnis and Marcus Scaurus, Head of the state, bid 700,000 sesterces. This has been exceeded, and considerably, in our own time by actors when buying their own freedom by means of their earnings, inasmuch as already in the time of our ancestors the actor Roscius is said to have earned 500,000 sesterces a year, unless anybody expects a mention in this place of the commissary in the Armenian war carried on not long ago for Tiridates, whom Nero liberated for 13,000,000 sesterces. But this was the price paid for a war, not for an individual, just as in truth when Clutorius Priscus bought one of Sejanus's eunuchs Paezon for 50,000,000, this was the price of lust and not of beauty. But Clutorius got away with this outrageous affair during a period of national mourning, as nobody had time to show him up.

40. The one race of outstanding eminence in virtue among all the races in the whole world is undoubtedly the Roman. What human being has had the greatest happiness is not a question for human judgement, since prosperity itself different people define in different ways and each according to his own temperament. If we wish to make a true judgement and discard all fortune's pomp in deciding the point, none among mortals is happy. Fortune deals lavishly and makes an indulgent bargain with the man whom it is possible justly to pronounce not unhappy. In fact, apart from other considerations, assuredly there is a fear that fortune may grow weary, and this fear once entertained, happiness has no firm foundation. What of the proverb that none among mortals is wise all the time? And would that as many men as possible may deem this proverb false, and not as the utterance of a prophet! Mortality, being so vain and so ingenious in selfdeception, makes its calculation after the manner of the Thracian tribe that puts stone counters of different colours corresponding to each day's experience in an urn, and on the last day sorts them and counts them out and thus pronounces judgement about each individual. What of the fact that the very day commended by that stone of brilliant whiteness contained the source of misfortune? How many men have been overthrown by attaining power! How many have been ruined and plunged into the direst torments by wealth! Wealth forsooth it is called if a man has had an hour of joy while surrounded by it. So doubtless is it! Different days pass verdict on different men and only the last day a final verdict on all men; and consequently no day is to be trusted. What of the fact that goods are not equal to evils even if of equal number, and that no joy can counterbalance the smallest grief? Alas what vain and foolish application! we count the number of the days, when it is their weight that is in question!

41. Only one woman can be found in the whole of history, the Spartan Lampido, who was daughter, wife and mother of a king; only one, Berenice, who was daughter, sister and mother of Olympic winners; only one family, the Curios, that has produced three orators in unbroken series, only one, the Fabii, three successive Chiefs of the Senate, Marcus Fabius Ambustus, his son Fabius Rullianus and his grandson Quintus Fabius Gurges.

42. All other cases are instances of changing Fortune, and are beyond counting. For what great joys does she produce except when following on disasters, or what immeasurable disasters except when following on enormous joys?

43. She preserved the senator Marcus Fidustius for 36 a years after his proscription by Sulla, but only to proscribe him a second time: he survived Sulla, but he lived to see Antony, and it is known that Antony proscribed him for no other reason than that he had been proscribed before! It is true she willed that Publius Ventidius should alone win a triumph from the Parthians, but she also in his boyhood led him captive in Gnaeus Pompeius's triumph after Asculumalbeit Masurius states that he was led in triumph twice, and Cicero that he was a mule-driver for an army bakery, and many authorities say that in his youth he supported his poverty by foot-slogging in the ranks! Also the elder Cornelius Balbus was consul, but he was impeached and handed over to a court of justice to decide as to his legal liability to a flogginghe being the first foreigner and actual native of the Atlantic coast to have held an honour refused by our ancestors even to Latium. Lucius Fulvius also is one of the notable examples, having been consul of the Tusculans at the time of their revolt and after coming over having been at once honoured with the same office by the Roman nation: he is the only man who ever in the same year in which he had been Rome's enemy won a triumph from the people whose consul he had been. Lucius Sulla is the sole human being hitherto who has assumed the surname Fortunate, in fact achieving the title by civil bloodshed and by making war upon his country. And what tokens of good fortune were his motive? His success in exiling and slaughtering so many thousands of his fellowcountrymen?

O what a false meaning to attach to the title! How doomed to misfortune in the future! Were not his victims more

Copyright © 2018 by Lord Henfield, Guildford Scientific Press PAGE 3463 fortunate at the time when dying, whom we pity today when Sulla is universally hated? Come, was not the close of his life more cruel than the calamity of all the victims of his proscriptions, when his body ate itself away and bred its own torments? And although he dissembled the pangs, and although on the evidence of that last drama of his, which may almost be said to have accompanied his death, we believed that he alone vanquished odium by glory, nevertheless he admitted forsooth that this one thing was wanting to his happinesshe had not dedicated the Capitol.

Quintus Metellus, in the panegyric that he delivered at the obsequies of his father Lucius Metellus the pontiff, who had been Consul twice, Dictator, Master of the Horse and Landcommissioner, and who was the first person who led a procession of elephants in a triumph, having captured them in the first Punic War, has left it in writing that his father had achieved the ten greatest and highest objects in the pursuit of which wise men pass their lives: for he had made it his aim to be a first-class warrior, a supreme orator and a very brave commander, to have the direction of operations of the highest importance, to enjoy the greatest honour, to be supremely wise, to be deemed the most eminent member of the senate, to obtain great wealth in an honourable way, to leave many children, and to achieve supreme distinction in the state; and that these things had fallen to his father's lot, and to that of no one else since Rome's foundation. It would be a lengthy matter to refute this, and it is superfluous to do so as it is abundantly rebutted by a single accidental misfortune: inasmuch as this Metellus passed an old age of blindness, having lost his sight in a fire when saving the statue of Pallas from the temple of Vesta, a memorable purpose but disastrous in its result. Consequently though he must not be pronounced unhappy, still he cannot be called happy. The nation bestowed on him a privilege given to no one else since the foundation of time, permission to ride to the senate-house in a chariot whenever he went to a meeting of the senatea great and highly honourable privilege, bnt one that was bestowed on him as a substitute for sight.

44. The son of this Metellus who made those remarks about his father is also counted among the exceptional instances of human happiness. Besides receiving an abundance of high honours and the surname of Macedonicus, he was borne to the tomb by four sons, one a praetor, three ex-consuls (two winners of triumphs), one an ex-censorthings that even separately have fallen to few men's lot. Nevertheless at the very height of his distinguished career, when coming back from the Field at midday, the market place and Capitol being empty he was carried off to the Tarpeian Rock by Gaius Atinius Labeo, surnamed Macerio, tribune of the plebs, whom when censor he had ejected from the senate, with the intention of hurling him down the cliff; the numerous company of persons who called him their father did it is true hasten to his aid, but as was inevitable in this sudden emergency, too late and as if coming for his funeral, and as he had not the right to resist and to repel the hallowed person of a tribune his virtue and his strictness would have resulted in his destruction, but with difficulty another tribune was found to intercede, and he was recalled from the very threshold of death; and subsequently he lived on the charity of another, as his own property had immediately been confiscated on the proposal of the very man whom he had himself caused to be condemned, just as though the penalty exacted from him of having his throat tied in a rope and the blood forced out through his ears were not sufficient! Although for my own part I should also reckon it as a disaster to have been at enmity with the second Africanus, on the evidence of Macedonicus himself, inasmuch as he said, "Go, my sons, celebrate his obsequies; you will never see the funeral of a greater citizen!" And he said this to sons who had already won the titles of Balearicus and Dahnaticus, while he himself was already Macedonicus. But even if only that injury be taken into account, who could rightly pronounce happy this man who ran the risk of perishing at the will of an enemy, and him not even an Africanus? Victory over what enemies was worth so much? or what honours and triumphal cars did not fortune put into the shade by that violent strokea censor dragged through the middle of the city (for this had been the sole reason for delaying), dragged to that same Capitol to which he himself had not thus dragged even prisoners when he was triumphing over the spoils taken from them? This was rendered a greater crime by the happiness that followed, as it placed Macedonicus in danger of losing even that great and glorious funeral in which he was carried to the pyre by his children who had themselves won triumphs, so that even his obsequies were a triumphal procession. Assuredly it is no firmly founded happiness that any outrage in a man's career has shattered, let alone so great an outrage as that. For the rest I know not whether it counts to the credit of our morals or increases the anguish of our indignation that among all the many Metelli that criminal audacity of Gaius Atinius for ever went unpunished.

45. Also in the case of his late Majesty Augustus, whom the whole of mankind enrols in the list of happy men, if all the facts were carefully weighed, great revolutions of man's lot

could be discovered: his failure with his uncle in regard to the office of Master of the Horse, when the candidate opposing him, Lepidus, was preferred; the hatred caused by the proscription; his association in the triumvirate with the wickedest citizens, and that not with an equal share of power but with Antony predominant; his flight in the battle of Philippi when he was suffering from disease, and his three days' hiding in a marsh, in spite of his illness and his swollen dropsical condition (as stated by Agrippa and Maecenas); his shipwreck off Sicily, and there also another period of hiding in a cave; his entreaties to Proculeius to kill him, in the naval rout when a detachment of the enemy was already pressing close at hand; the anxiety of the struggle at Perugia, the alarm of the Battle of Actium, his fall from a tower in the Pannonian Wars: and all the mutinies in his troops, all his critical illnesses, his suspicion of Marcellus's ambitions, the disgrace of Agrippa's banishment, the many plots against his life, the charge of causing the death of his children; and his sorrows that were not due solely to bereavement, his daughter's [Julia] adultery and the disclosure of her plots against her father's life, the insolent withdrawal of his stepson Nero, another adultery, that of his grand-daughter; then the long series of misfortuneslack of army funds, rebellion of Illyria, enlistment of slaves, shortage of man power, plague at Rome, famine in Italy, resolve on suicide and death more than half achieved by four days' starvation; next the disaster of Varus and the foul slur upon his dignity; the disowning of Postumius Agrippa after his adoption as heir, and the sense of loss that followed his banishment: then his suspicion in regard to Fabius and the betrayal of secrets; afterwards the intrigues of his wife and Tiberius that tormented his latest days. In fine, this godwhether deified more by his own action or by his merits I know notdeparted from life leaving his enemy's son his heir.

46. In this review there come to mind the Delphic oracles sent forth by the god as if for the purpose of chastising the vanity of mankind. Here are two: 'The happiest of men is Pedius, who lately fell in battle for his country'; and secondly, when the oracle was consulted by Gyges, then the wealthiest king in the world, 'Aglaus of Psophis is happier.' This was an elderly man who cultivated an estate, small but amply sufficient for his yearly provision, in a very shut in corner of Arcadia, and who had never left it, and being (as his kind of life showed) a man of very small desires experienced a very small amount of misfortune in life.

47. By the command of the same oracle and with the assent of Jupiter the supreme deity, Euthynus the boxer, who won all his matches at Olympia and was only once beaten, was made a saint in his lifetime and to his own knowledge. His native place was Locri in Italy; I noticed that Callimachus records as an unparalleled marvel that a statue of him there and another at Olympia were struck by lightning on the same day, and that the oracle commanded that sacrifice should be offered to him; this was repeatedly done both during his lifetime and when he was dead, and nothing about it is surprising except that the gods so decreed.

48. As to the length and duration of men's life, not only geographical position but also dates and the various fortunes allotted at birth to each individual have made it uncertain. Hesiod, who first put forth some observations on this matter, placing many creatures above man in respect of longevity, fictitiously as I think, assigns nine of our lifetimes to the crow, four times a crow s life to stags, three times a stag's to ravens. and for the rest in a more fictitious style in the case of the phoenix and the nymphs. The poet Anacreon attributes 150 years to Arganthonius king of the Tartcsii, 10 years more to Cinyras king of Cyprus, and 200 to Aegimius. Theopompus gives 157 to Epimenides of Cnossus. Hellanicus says that some members of the clan of the Epii in Aetolia complete 200 years, and he is supported by Damastes who records that one of them Pictoreus, a man of outstanding stature and strength, even lived 300 years; Ephorus records Arcadian kings of 300 years; Alexander Cornelius says that a certain Dando in Illyria lived 500 years. Xenophon in his Coasting Voyage says that a king of the island of the Lutmii lived to 600, and as though that were only a modest fabrication that his son lived to 800. All of these exaggerations were due to ignorance of chronology, because some people made the year coincide with the summer, the winter being a second year, others marked it by the periods of the four seasons, for example the Arcadians whose years were three months long, and some by the waning of the moon, as do the Egyptians. Consequently with them even individuals are recorded to have lived a thousand years.

But to pass to admitted facts, it is almost certain that Argathonius of Cadiz reigned for 80 years; his reign is thought to have begun in his fortieth year. It is not questioned that Masinissa reigned 60 years and that the Sicilian Gorgias lived 108 years. Quintus Fabius Maxixnus was augur for 63 years. Marcus Perperna and recently Lucius Volusius Saturninus outlived all the persons whose votes in debate they had taken as consuls; Perperna left only seven of those whom as censor he had electedhe lived to 98. In this matter it occurs to me to note also that there has only been a single five-year period in which no senator has died, from when Flaccus and Albinus as censors performed the purification ceremony to the next censorsbeginning 175 B.C. Marcus Valerius Corvinus completed 100 years, and there was an interval of 46 years between his first and sixth consulships. He also took his seat in the curule chair 21 times, which is a record; but his length of life was equalled by the pontifex Metellus.

Also among women Livia wife of Rutilius exceeded 97 years, Statilia a lady of noble family under the Emperor Claudius 99. Terentia Cicero's wife 103, Clodia Ofilius's wife 115; the latter also bore 15 children. The actress Lucceia delivered a recitation on the stage at 100. Galeria Copiola the actress of interludes was brought back to the stage in the consulship of Gaius Poppaeus and Quintus Sulpicius, at the votive games celebrated for the recovery of his late Majesty Augustus, when in her 104th year; she had been brought out at her first appearance by Marcus Pomponius, aedile of the plebs, in the consulship of Gaius Marius and Gnaeus Carbo, 91 years before, and she was brought back to the stage when an old woman by Pompey the Great as a marvel at the deification of the big theatre. Also Pedianus Asconius states that Sammula lived 110 years. I am less surprised that Stephanio, who first introduced dancing in national costume, danced at both secular games, both those of his late Majesty Augustus and those celebrated by Claudius Caesar in his fourth consulship, as the interval was only 63 years, although he also lived a long time afterwards. Mucianus is the authority for one Tempsis having lived 150 years at the place called Mount Tmolus Heights; and the census of Claudius Caesar gives the same number of years for Titus Fullonius of Bologna, which has been verified by comparing the census returns he had made previously and by the facts of his careerfor the emperor gave his attention to this matter.

49. The topic seems of itself to call for the view held by astronomical science. Epigenes declared that it is impossible to live 112 years; Berosus said that 116 years can be exceeded. Also the theory handed down by Petosiris and Necepsos is still extant (it is called the Theory of Quarters, from its dividing up the Zodiac into groups of three signs); this theory shows it possible to attain 124 years of life in the region of Italy. These thinkers declared that nobody exceeds the ascendant measure of 90 degrees (what is called 'risings'), and stated that this period itself may be cut short by the encounter of maleficent stars, or even by their rays and by those of the sun. Again it is uncertain what is the greatest longevity allowed by the school of Aesculapius, which says that fixed periods of life are received from the stars; however, they say that longer periods of life are rare inasmuch as vast crowds of men are born at critical moments in the hours of the lunar days, for example the 7th and the 15th hour counting by night and day, who are liable to die under the law of the ascending scale of years, called 'gradations', persons so born rarely exceeding their fifty-fourth year.

At the outset therefore the variations in the science itself show how uncertain the matter is. In addition there are the experiences of the last census, held within the last four years by the Emperors Caesar Vespasian father and son as Censors. Nor is it necessary to ransack all the records: we will only produce cases from the middle region between the Apennines and the Po. Three persons declared 120 years at Parma and one at Brescello; two at Parma 125; one man at Piacenza and one woman at Faenza 130; Lucius Terentius son of Marcus at Bologna 135; Marcus Aponius 140 and Tertulla 137 at Itimini. In the hills this side of Piacenza is the township of Veleia, where six declared 110 years, four 120, one (Marcus Mucius Felix, son of Marcus, of the Galerian tribe) 150. And, not to delay with further instances in a matter of admitted fact, the census registered in the eighth region of Italy 54 persons of 100 years of age, 14 of 110, 2 of 125, 4 of 130, the same number of 135 or 137, 3 of 140.

Other instances of the fickleness of mortal fortunes are these: Homer has recorded that men of such diverse fates as Hector and Polydamas were born on the same night; Marcus Caelius Rufus and Gaius Licinius Calvus, both orators but with such different success, were born on the same day, May 28 in the consulship [82 BC] of Gaius Marius and Gnaeus Carbothe latter's third. Taking the entire world, this happens daily even to persons born at the same hoursmasters and slaves, kings and paupers come into existence simultaneously.

50. Fublius Cornelius Rufus, who was consul with Manius Curius, lost his sight while asleep, when dreaming that it was happening to him. In the opposite way, Jason of Pherae being ill with a tumour and given up by the doctors sought death in battle, but was wounded in the chest and so obtained a cure from the enemy. In the battle against the clans of the Allobroges and Arverni on the river Isre, on August 8, when 130,000 of the foe were killed, the consul Quintus Fabius Maximus got rid of a quartan ague in action. In fact whatever be this gift of nature that is bestowed upon us, it is uncertain and insecure, indeed sinister and of brief duration even in the case of those to whose lot it has fallen in most bounteous measure, at all events when we regard the whole extent of time. What of the fact that, if we take into account our nightly period of slumber, everybody is alive for only a half of his life,

Copyright © 2018 by Lord Henfield, Guildford Scientific Press PAGE 3464 whereas an equal portion is passed in a manner that resembles death, or, in default of slumber, torture. And we are not counting in the years of infancy that lack sensation, nor those of old age that remains alive to be tormented, nor all the kinds of dangers, all the diseases, all the fears, all the anxieties, with death so often invoked that this is the commonest of prayers. But nature has granted man no better gift than the shortness of life. The senses grow dull, the limbs are numb, sight, hearing, gait, even the teeth and alimentary organs die before we do, and yet this period is reckoned a portion of life. Consequently it is virtually a miracleand this is the solitary instance of it foundthat the musician Xenophilus lived to 105 without any bodily disablement. But assuredly with all the rest of men, as in the case of none of the other animals, morbid heat or else stiffness returns through the several portions of the limbs at fixed hours, and not only at certain hours but also every three or four days or nights, even all the year round. And moreover the death of the intellect in some measure is a disease. For nature has imposed certain laws even upon diseases: a four-day-period fever never begins at midwinter or in the winter months, and some people are not attacked by it when over the age of 60, while with others, particularly women, it is discarded at puberty; and old men are least susceptible to plague. For diseases attack not only entire nations but also particular classes, sometimes the slaves, sometimes the nobility, and so Through other grades. In this respect it has been observed that plague always travels from southern quarters westward and almost never otherwise, and that it does not spread in winter, nor during a period exceeding three months.

51. Again, signs of approaching death are: in a case of insanity laughter, but in delirium toying with fringes and making folds in the bed-clothes, disregard of persons trying to keep the patient awake, making water, while the most unmistakable signs are in the appearance of the eves and nostrils, and also in lying constantly on the back, in an irregular and excessively slow pulse, and the other symptoms noted by that prince of medicine Hippocrates. And whereas the signs of death are innumerable, there are no signs of health being secure; inasmuch as the ex-censor Cato gave an as it were oracular utterance addressed to his son about healthy persons also, to the effect that senile characteristics in youth are a sign of premature death. But so unlimited is the number of diseases that the Syrian Pherecydes expired with a swarm of maggots bursting out of his body. Some people suffer from perpetual fever, for instance Gaius Maecenas: the same had not an hour's sleep in the last three years of his life. The poet Antipater of Sidon used to have a yearly attack of fever on one day only, his birthday, and this at a fairly advanced age carried him off.

52. The ex-consul Aviola came to life again on the funeral pyre, and as the flame was too powerful for it to be possible to come to his assistance, was burnt alive. A similar cause of death is recorded in the case of the ex-praetor Lucius Lamia, while Gaius Aelius Tubero, a former praetor, is recorded by Messala Rufus and most authorities to have been recovered from the pyre. This is the law of mortals: we are born for these and similar accidents of fortune, so that in the case of a human being no confidence must he placed even in death. Among other instances we find that the soul of Hermotimus of Clazomenae used to leave his body and roam abroad, and in its wanderings report to him from a distance many things that only one present at them could know ofhis body in the meantime being only half-conscious; till finally some enemies of his named the Cantharidae burned his body and so deprived his soul on its return of what may be called its sheath. We also read that the soul of Aristeas at Proconnesus was seen flying ont of his mouth in the shape of a raven, with a great deal of fabulous invention that follows this. This inventiveness I for my part also receive in a similar way in the case of Epimenides of Cnossusthat when a boy, being weary with the heat and with travel, he slept in a cave 57 years, and when he woke, just as if it had been on the following day, was surprised at the appearance of things and the change in them; and afterwards old age came on him in the same number of days as he had slept years, though nevertheless he lived to the age of 157. The female sex seems specially liable to this malady, caused by distortion of the womb; if this is set right, the breathing is restored. To this subject belongs the essay of Heracides, well known in Greece, about the woman recalled to life after being dead for seven days.

Also Varro records that when he was acting as one of the Twenty Commissioners and apportioning lands at Capua a person being carried out on a bier to burial returned home on foot; and that the same thing occurred at Aquino; and that also at Rome his maternal aunt's husband Corfidius came to life again after his funeral had been arranged for with an undertaker, and that he himself superintended the funeral of the relative who had made the arrangement. He adds some marvellous occurrences that it would be suitable to have set out in their entirety: that there were two brothers Corfidius, of the rank of knights, to the elder of whom it happened that he appeared to have expired, and when his will was opened the arranging his funeral; in the meantime the brother who appeared to be dead summoned the servants by clapping his hands and told them that he had come from his brother, who had entrusted his daughter to his care, and had also shown him where he had without anybody's knowledge hidden some gold in a hole dug in the ground, and had asked that the preparations that he had made for his brother's funeral might be used for himself. While he was telling this story his brother's servants hurriedly came with the news that their master was dead; and the gold was found in the place where he had said. Moreover life is full of these prophecies, but they are not worth collecting, because more often than not they are false, as we will prove by an outstanding example. In the Sicilian War the bravest man in Caesar's navies Gabienus was taken prisoner by Sextus Pompeius, by whose order his throat was cut and almost severed, and so he lay a whole day on the shore. Then on the arrival of evening, a crowd having been gathered to the spot by his groans and entreaties, he besought that Pompey should come to him, or send one of his personal staff, as he had come back from the lower world and had some news to tell him. Pompey sent several of his friends, who were told by Gabienus that the gods below approved Pompey's cause and the righteous party, so that the issue would be what Pompey desired; that he had had orders to bring this news, and that a proof of its truth would be that as soon as his errand was accomplished he would expire. And this so happened. There are also cases of persons appearing after burialsave that our subject is the works of nature, not prodigies.

53. But most miraculous and also frequent, are sudden deaths (this is life's supreme happiness), which we shall show to be natural. Verrius has reported a great many, but we will preserve moderation with a selection. Cases of people who died of joy are (besides Chilo about whom we have spoken) Sophocles and Dionysius the tyrant of Sicily, in both cases after receiving news of a victory with a tragedy: also the mother who saw her son back safe from Cannae in contradiction of a false message; Diodorus the professor of logic died of shame because he could not at once solve a problem put to him in jest by Stilpo. Cases of men dying from no obvious causes are: while putting on their shoes in the morning, the two Caesars, the praetor and the ex-praetor, father of the dictator Caesar, the latter dying at Pisa and the former at Rome; Quintus Fabius Maximus on 31 December in the year of his consulship, in whose place Gaius Rebilus obtained the office for only a few hours; also the senator Gaius Volcatius Gurgesall of these men so healthy and fit that they were thinking of going out for a walk; QuintusAemilius Lepidus who bruised his great toe in the doorway of his bedroom just as he was going out; Gaius Aufidius who after he had gone out hit his foot against something in the Cornitium when he was on his way to the senate. Also an envoy who had pleaded the cause of Rhodes in the senate to the general admiration, just as he wanted to leave the senatehouse expired on the threshold; Gnaeus Baebius Tamphilus, who had himself also held the praetorship, died just after asking his footman the time; Aulus Pompeius died on the Capitol after paying reverence to the gods, Mantis Juventius Thalna the consul while offering sacrifice, Gaius Servilius Pansa while standing at a shop in the market-place, leaning on his brother Publius's arm, at seven o'clock in the morning, Baebius the judge while in the act of giving an order for enlargement of bail, Marcus Terentius Corax while writing a note in the market-place; and moreover last year, a Knight of Rome died while saying something in the ear of an ex-consul, just in front of the ivory statue of Apollo in the Forum of Augustus: and, most remarkable of all, the doctor Gaius Julius died from passing the probe through his eye while pouring in ointment, the ex-consul Aulus Manlius Torquatus while helping himself to a cake at dinner, Lucius Tuccius, Sulla's doctor, while drinking a draught of mead, Appius Saufeius when he had drunk some mead and was sucking an egg after coming back from the bathhouse, Publius Quintius Scapula when out to dinner with Aquilius Gallus, Decimus Saufeius the clerk when lunching at home. Cornelius Gallus, expraetor, and Titus Hetereius Knight of Rome died while with women; and, cases remarked on by our own generation, two members of the Order of Knighthood died when with the same ballet-dancer Mystieus, the leading beauty of the day. However, the most enviable case of a peaceful end is one recorded by our forefathers, that of Marcus Ofilius Hilarus: he was an actor in comedy, and having had a considerable success with the public on his birthday and while giving a party, when dinner was served called for a hot drink in a tankard, and at the same time picked up the mask that he had worn on that day and while gazing at it transferred the wreath from his own head to it, and in this attitude lay quite stiff without anybody noticing, until the guest on the next couch warned

him that his drink was getting cold. These are happy instances, but there are countless numbers of unhappy ones. Lucius Domitius, a man of very distinguished family, who was defeated at Marseilles and was taken prisoner, also by Caesar, at Corfinium, grew tired of life and drank poison, but afterwards made every effort to save his life. It is found in the official records that at the funeral of Felix the charioteer of the Reds one of his backers threw himself upon the pyrea pitiful storyand the opposing backers tried to prevent this score to the record of a professional by asserting that the man had fainted owing to the quantity of scents! Not long before, the corpse of Marcus Lepidus, the man of distinguished family whose death from anxiety about his divorce we have recorded above, had been dislodged from the pyre by the violence of the flame, and as it was impossible to put it back again because of the heat, it was burnt naked with a fresh supply of faggots at the side of the pyre.

54. Cremation was not actually an old practice at Rome: the dead used to be buried. But cremation was instituted after it became known that the bodies of those fallen in wars abroad were dug up again. All the same many families kept on the old ritual, for instance it is recorded that nobody in the family of the Cornelii was cremated before Sulla the dictator, and that he had desired it because he was afraid of reprisals for having dug up the corpse of Gaius Marius. [But burial is understood to denote any mode of disposal of a corpse, but interment means covering up with earth.]

55. There are various problems concerning the spirits of the departed after burial. All men are in the same state from their last day onward as they were before their first day, and neither body nor mind possesses any sensation after death, any more than it did before birth for the same vanity prolongs itself also into the future and fabricates for itself a life lasting even into the period of death, sometimes bestowing on the soul immortality, sometimes transfiguration, sometimes giving sensation to those below, and worshipping ghosts and making a god of one who has already ceased to be even a manjust as if man's mode of breathing were in any way different from that of the other animals, or as if there were not many animals found of greater longevity, for which nobody prophesies a similar immortality! But what is the substance of the soul taken by itself? what is its material? where is its thought located? how does it see and hear, and with what does it touch? what use does it get from these senses, or what good can it experience without them? Next, what is the abode. or how great is the multitude, of the souls or shadows in all these ages? These are fictions of childish absurdity, and belong to a mortality greedy for life unceasing. Similar also is the vanity about preserving men's bodies, and about Democritus's promise of our coming to life again who did not come to life again himself! Plague take it, what is this mad idea that life is renewed by death? what repose are the generations ever to have if the soul retains permanent sensation in the upper world and the ghost in the lower? Assuredly this sweet but credulous fancy ruins nature's chief blessing, death, and doubles the sorrow of one about to die by the thought of sorrow to come hereafter also; for if to live is sweet, who can find it sweet to have done living? But how much easier and safer for each to trust in himself, and for us to derive our idea of future tranquillity from our experience of it before birth!

56. Before we quit the subject of man's nature it seems suitable to point out the various discoveries of different persons. Father Liber instituted buying and selling, and also invented the emblem of royalty, the crown, and the triumphal procession. Ceres discovered corn, men having hitherto lived on acorns; she also invented grinding corn and making flour in Attica (or, as others say, in Sicily), and for this was deemed a goddess. Also she first gave laws, though others have thought this was done by Rhadamanthus.

I am of opinion that the Assyrians have always had writing, but others, e.g. Gellius, hold that it was invented in Egypt by Mercury, while others think it was discovered in Syria; both schools of thought believe that Cadmus imported an alphabet of 16 letters into Greece from Phoenicia and that to these Palamedes at the time of the Trojan war added the four characters $Z\Psi\Phi X$, and after him Simonides the lyric poet added another four $Y \equiv \Omega \Theta Y$, all representing sounds recognised also in the Roman alphabet. Aristotle holds that the primitive alphabet contained 18 letters, and that Ψ and Z were added by Epicharmus more probably than Palamedes. Anticlides records that a person named Menos invented the alphabet in Egypt 15,000 years before Phoroneus, the most ancient king of Greece, and he attempts to prove this by the monuments. On the other side Epigenes, an authority of the first rank, teaches that the Babylonians had astronomical observations for 730,000 years inscribed on baked bricks; and those who give the shortest period, Berosus and Critodemus. make it 490,000 years; from which it appears that the alphabet has been in use from very ancient times. It was brought to Latium by the Pelasgi.

Brick-kilns and houses were first introduced by the brothers Euryalus and Hyperbius at Athens; previously caves had served for dwellings. Gellius accepts Toxius son of Uranus as the inventor of building with clay, the example having been taken from swallows' nests. Cecrops named after himself the first town, Cecropia, which is now the Acropolis at Athens; though some hold that Argos had been founded before by King Phoroneus, and certain authorities say Sicyon also, but the Egyptians hold that Diospolis was founded in their country long before. Tiles were invented by Cinyra, son of Agriopa, as well as mining for copper, both in the island of Cyprus, and also the tongs, hammer, crowbar and anvil; wells by Danaus who came from Egypt to Greece to the region that used to be called Dry Argos; stone quarrying by Cadmus at Thebes, or according to Theophrastus, in Phoenicia; walls were introduced by Thrason, towers by the Cyclopes according to Aristotle but according to Theophrastus by the Tirynthians; woven fabrics by the Egyptians, dyeing woollen stuffs by the Lydians at Sardis, the use of the spindle in the manufacture of woollen by Closter son of Arachne, linen and nets by Arachne, the fuller's craft by Nicias of Ntegara, the shoemaker's by Tychius of Boeotia; medicine according to the Egyptians was discovered among themselves, but according to others through the agency of Arabus son of Babylon and Apollo: and the science of herbs and drugs was discovered by Chiron the son of Saturn and Philyra. Aristotle thinks that Lydus the Scythian showed how to melt and work copper, but Theophrastus holds that it was the Phrygian Delas: manufactures of bronze some ascribe to the Chalybes and others to the Cyclopes; the forging of iron Hesiod ascribes to the people called the Dactvli of Ida in Crete. Erichthonius of Athens, or according to others Aeacus, discovered silver; mining and smelting gold was invented by Cadmus the Phoenician at Mount Pangaeus, or according to others by Thoas or Aeacus in Panchaia, or by the Sun, son of Oceanus, to whom Gellius also assigns the discovery of medicine derived from minerals. Tin was first imported by Midacritus from the island of Cassiteriss Working in iron was invented by the Cyclopes, potteries by Coroebus of Athens, the potter's wheel by the Scythian Anacharsis, or according to others by Hyperbius of Corinth. Carpentry was invented by Daedalus, and with it the saw, axe, plumb-line, gimlet, glue, isinglass; but the square, the plummet, the lathe and the lever by Theodorus of Samos, measures and weights by Phidon of Argos, or, as Gellius preferred, Palamedes; fire from flint by Pyrodes son of Cilix, the storing of fire in a fennel-stalk by Prometheus; a vehicle with four wheels by the Phrygians, trade by the Phoenicians, viticulture and arboriculture by Eumolpus of Athens, diluting wine with water by Staphylus son of Silenus, oil and oil-mills by Aristaeus of Athens, honey by the same; the ox and the plough by Buzyges of Athens, or, as others say, by Triptolemus; monarchical government by the Egyptians, republican by the Athenians after Theseus. The first tyrant was Phalaris at Girgenti. Slavery was invented by the Spartans. Capital trials were first carried on in the Areopagus

The Africans first fought with clubs (called poles) in a war against the Egyptians. Shields were invented by Proetus and Acrisius in making war against each other, or else by Chalcus son of Athamas; the breastplate by Midias of Messene, the helmet, sword and spear by the Spartans, greaves and helmetplumes by the Carians. The bow and arrow is said by some to have been invented by Scythes son of Jove; others say that arrows were invented by Perses son of Perseus, lances by the Aetolians, the spear slung with a thong by Aetolus son of Mars, spears for skirmishing by Tyrrhenus, the javelin by the same, the battle-axe by Penthesilea the Amazon, huntingspears and among missile engines the scorpion by Pisaeus, the catapult by the Cretans, the ballista and the sling by the Syrophoenicians, the bronze trumpet by Pysaeus son of Tyrrhenus, tortoise-screens by Artemo of Clazomenae, among siege-engines the horse (now called the ram) by Epius at Troy; horse-riding by Bellerophon, reins and saddles by Pelethronius, fighting on horseback by the Thessalians called Centaurs, who dwelt along Mount Pelion. The Phrygian race first harnessed pairs, Erichthonius four-in-hands. Military formation, the use of passwords, tokens and sentries were invented by Palamedes in the Trojan war, signalling from watch-towers by Sinon in the same war, truces by Lycaon, treaties by Theseus.

Auguries from birds were invented by Car, from whom Caria got its name; Orpheus added auspices derived from the other animals, Delphus divination from victims, Amphiaraus divination from fire. Tiresias of Thebes divination by inspecting birds' entrails, Amphictyon the interpretation of portents and dreams: Atlans son of Libva, or as others say the Egyptians and others the Assyrians, astronomy, Anaximander of Miletus the use of a globe in astronomy, Aeolus son of Hellen the theory of winds; Amphion music, Pan son of Mercury the pipe and single flute, Midas in Phrygia the slanting flute, Marsyas in the same nation the double flute, Amphion the Lydian modes, the Thracian Thamyras the Dorian, Marsyas of Phrygia the Phrygian, Amphion, or others say Orpheus and others Linus, the harp. Terpander first sang with seven strings, adding three to the original four, Simonides added an eighth, Timothens a ninth. Thamyris first played the harp without using the voice, Amphion, or according to others Linus, accompanied the harp with singing; Terpander composed songs for harp and voice. Ardalus of Troezen instituted singing to the flute. The Curetes taught dancing in armour, Pyrrhus the Pyrrhic dance; both of there were in Crete. Hexameter verse we owe to the Pythian oracle, but as to the origin of poetry there is much debate, though it is proved to have existed before the Trojan War. Pherecydes

of Syria instituted prose composition in the period of King Cyrus, Cadmus of Miletus history; gymnastic games were started by Lycaon in Arcadia, funeral games by Acastus in Iolcus, and subsequently by Theseus at the Isthmus and by Hercules at Olympia; wrestling by Pytheus, the sport of ballthrowing by Gyges of Lydia; painting by the Egyptians, and in Greece by Euchir the kinsman of Daedalus according to Aristotle, but according to Theophrastus by Polygnotus of Athens.

Danaus first came from Egypt to Greece by ship; before that time rafts were used for navigation, having been invented by King Erythras for use between the islands in the Red Sea. Persons are found who think that vessels were devised earlier on the Hellespont by the Mysians and Trojans when they crossed to war against the Thracians. Even now in the British ocean coracles are made of wicker with hide sown round it, and on the Nile canoes are made of papyrus, rushes and reeds. The first voyage made in a long ship is attributed by Philostephanus to Jason, by Hegesias to Parhalus, by Ctesias to Semiramis, and by Archemachus to Aegaeo. Further advances were as follows:

(Vessel, Inventor, Authority, note)

Bireme double-banked galley: the Erythraeans (Phoenicians*), Damastes

Trireme: Aminocles of Corinth (Phoenicians*), Thucydides Quadrireme: the Carthaginians (western Phoenicians*), Aristotle

Quinquereme: the Salaminians (Dionysius I of Syracuse c.432-367 BC, Greek*), Mnesigiton

Hexareme or sexireme, galleys of six banks: the Syracusans (Dionysius II of Syracuse; r. 367–357, 346–344 BC), Xenagoras

up to ten banks: Alexander the Great, Mnesigiton

up to twelve banks: Ptolemy Soter, Philostephanus

up to fifteen banks: Demetrius son of Antigonus, Philostephanus

up to thirty banks: Ptolemy Philadelphus, Philostephanus up to forty banks: Ptolemy Phiopator surnamed Tryphon. Philostephanus

The freight-ship was invented by Hippus of Tyre (a Phoenician), the cutter by the Cyrenians, the skiff by the Phoenicians, the yacht by the Rhodians, the yawl by the Cyprians; the Phoenicians invented observing the stars in sailing, the town of Copae invented the oar, the city of Plataea the oar-blade, Icarus sails, Daedalus mast and yard, the Samians or Pericles of Athens the cavalry transport, the Thasians decked longshipspreviously the marines had fought from the bows and stem only. Pisaeus son of Tyrrenus added beaks, Enpalamus the anchor, Anacharsis the double-fluked anchor, Pericles of Athens grappling-irons and claws, Tiphys the tiller. Minos was the first who fought a battle with a fleet. Hyperbius son of Mars first killed an animal, Prometheus

an ox. LVII. The first of all cases of tacit agreement between the nations was the convention to employ the alphabet of the Ionians.

58. The practical identity of the old Greek alphabet with the present Latin one will be proved by an ancient Delphic tablet of bronze (at the present day in the Palace, a gift of the emperors) dedicated to Minerva, with the following inscription: Tithe dedicated by Nausicrates to the Daughter of Zeus...

59. The next agreement between nations was in the matter of shaving the beard, but with the Romans this was later. Barbers came to Rome from Sicily in 300 B.C., according to Varro being brought there by Publius Titinius Mena; before then the Romans had been unshaved. The second Africanus first introduced a daily shave. His late Majesty Augustus never neglected the razor.

60. The third agreement was in the observation of the hours (this now being an addition made by theory), the date and inventor of which we have stated in Book 2. This also happened later at Rome: in the Twelve Tables only sunrise and sunset are specified; a few years later noon was also added the consuls' apparitor announcing it when from the Senatehouse he saw the sun between the Beaks and the Greek Lodging. When the sun sloped from the Maenian Column to the Prison he announced the last hour, but this only on clear days, down to the First Punic War. We have it on the authority of Fabius Vestalis that the first sundial was erected 11 years before the ware with Pyrrhus at the Temple of Quirinus by Lucius Papirius Cursor when dedicating that temple, which had been vowed by his father; but Fabius does not indicate the principle of the sundial's construction or the maker, nor where it was brought from or the name of the writer who is his authority for the statement. Marcus Varro records that the first public sundial was set up on a column along by the Beaks during the First Punic War after Catania in Sicily had been taken a by the consul Manius Valerius Messala, and that it was brought from Sicily thirty years later than the traditional date of Papirius's sundial, B.C. 264. The lines of this sundial did not agree with the hours, but all the

same they followed it for 99 years, till Quintus Marcius Philippus who was Censor with Lucius Paulus placed a more carefully designed one next to it, and this gift was received as one of the most welcome of the censor's undertakings. Even then however the hours were uncertain in cloudy weather, until the next lustrum, when Scipio Nasica the colleague of Laenas instituted the first water-clock dividing the hours of the nights and the days equally, and dedicated this timepiece in a roofed building, B.C. 159. For so long a period the divisions of daylight had not been marked for the Roman public.

We will now turn to the rest of the animals, beginning with land-animals.

NATURAL HISTORY BOOK 8

1. Let us pass to the rest of the animals, and first those that live on land.

The largest land animal is the elephant, and it is the nearest to man in intelligence: it understands the language of its country and obeys orders, remembers duties that it has been taught, is pleased by affection and by marks of honour, nay more it possesses virtues rare even in man, honesty, wisdom, justice, also respect for the stars and reverence for the sun and moon. Authorities state that in the forests of Mauretania, when the new moon is shining, herds of elephants go down to a river named Amilo and there perform a ritual of purification, sprinkling themselves with water, and after thus paying their respects to the moon return to the woods carrying before them those of their calves who are tired. They are also believed to understand the obligations of another's religion in so far as to refuse to embark on board ships when going overseas before they are lured on by the mahout's sworn promise in regard to their return. And they have been seen when exhausted by suffering (as even those vast frames are attacked by diseases) to lie on their backs and throw grass up to the heaven, as though deputing the earth to support their prayers. Indeed so far as concerns docility, they do homage to their king by kneeling before him and proffering garlands. The Indians employ the smaller breed, which they call the bastard elephant, for ploughing.

2. At Rome they were first used in harness to draw the chariot of Pompey the Great in his African triumph, as they are recorded to have been used before when Father Liber went in triumph after his conquest of India. Procilius states that at Pompey's triumph the team of elephants were unable to pass out through the gate. At the gladiatorial show given by Germanicus Caesar some even performed clumsy movements in figures, like dancers. It was a common display for them to hurl weapons through the air without the wind making them swerve, and to perform gladiatorial matches with one another or to play together in a sportive war-dance. Subsequently they even walked on tightropes, four at a time actually carrying in a litter one that pretended to be a lady lying-in; and walked among the couches in dining-rooms full of people to take their places among the guests, planting their steps carefully so as not to touch any of the drinking party.

3. It is known that one elephant which was rather slowwitted in understanding instructions given to it and had been punished with repeated beatings, was found in the night practising the same. It is surprising that they can even climb up ropes, but especially that they can come down them again, at all events when they are stretched at a slope. Mucianus who was three times consul states that one elephant actually learnt the shapes of the Greek letters, and used to write out in words of that language: 'I myself wrote this and dedicated these spoils won from the Celts;' and also that he personally had seen elephants that, when having been brought by sea to Pozzuoli they were made to walk off the ship, were frightened by the length of the gangway stretching a long way out from the land and turned round and went backwards, so as to cheat themselves in their estimation of the distance.

4. They themselves know that the only thing in them that makes desirable plunder is in their weapons which Juba calls 'horns,' but which the author so greatly his senior, Herodotus, and also common usage better term 'tusks:' consequently when these fall off owing to some accident or to age they bury them in the ground. The tusk alone is of ivory: otherwise even in these animals too the skeleton forming the framework of the body is common bone; albeit recently owing to our poverty even the bones have begun to be cut into layers, inasmuch as an ample supply of tasks is now rarely obtained except from India, all the rest in our world having succumbed to luxury. A young elephant is known by the whiteness of its tusks. The beasts take the greatest care of them; they spare the point of one so that it may not be blunt for fighting and use the other as an implement for digging roots and thrusting massive objects forward: and when surrounded by a party of hunters they post those with the smallest tusks in front so that it may be thought not worth while to fight them, and afterwards when exhausted they break their tusks by dashing them against a tree and ransom themselves at the price of the desired booty

know why they are hunted, but also that almost all know what they must beware of. It is said that when an elephant accidentally meets a human being who is merely wandering across its track in a solitary place it is good-tempered and peaceful and will actually show the way; but that when on the other hand it notices a man's footprint before it sees the man himself it begins to tremble in fear of an ambush, stops to sniff the scent, gazes round, trumpets angrily, and avoids treading on the footprint but digs it up and passes it to the next elephant, and that one to the following, and on to the last of all with a similar message, and then the column wheels round and retires and a battle line is formed: since the smell in question lasts to be scented by them all, though in the majority of cases it is not even the smell of bare feet. Similarly a tigress also, It is said, even though savage to all other animals and herself scorning the footprints even of an elephant, when she sees the track of a human being at once carries her cubs elsewhere. Though how has she recognized or where has she seen before the person that she fears? For it is certain that such forests are very little frequented. Granted that no doubt they may be surprised by the mere rarity of the print; but how do they know that it is something to be afraid of? Indeed there is a further point, why should they dread even the sight of a man himself when they excel him so greatly in strength, size and speed? Doubtless it is Nature's law and shows her power, that the fiercest and largest wild beasts may have never seen a thing that they ought to fear and yet understand immediately when they have to fear it.

5. It is remarkable in the case of most animals that they

Elephants always travel in a herd; the oldest leads the column and the next oldest brings up the rear. When going to ford a river they put the smallest in front, so that the bottom may not be worn away by the tread of the larger ones, thus increasing the depth of the water. Antipater states that two elephants employed for military purposes by King Antiochus were known to the public even by name; indeed they know their own names. It is a fact that Cato, although he has removed the names of military commanders from his Annals, has recorded that the elephant in the Carthaginian army that was the bravest in battle was called the Syrian, and that it had one broken tusk. When Antiochus was trying to ford a river his elephant Aiax refused, though on other occasions it always led the line; thereupon Antiochus issued an announcement that the elephant that crossed should have the leading place and he rewarded Patroclus, who made the venture, with the gift of silver harness, an elephant's greatest delight, and with every other mark of leadership. The one disgraced preferred death by starvation to humiliation: for the elephant has a remarkable sense of shame, and when defeated shrinks from the voice of its conqueror, and offers him earth and foliage. Owing to their modesty, elephants never mate except in secret, the male at the age of five and the female at ten; and mating takes place for two years, on five days, so it is said, of each year and not more; and on the sixth day they give themselves a shower-bath in a river, not returning to the herd before. Adultery is unknown among them, or any of the fighting for females that is so disastrous to the other animalsthough not because they are devoid of strong affection, for it is reported that one elephant in Egypt fell in love with a girl who was selling flowers, and (that nobody may think that it was a vulgar choice) who was a remarkable favourite of the very celebrated scholar Aristophanes; and another elephant is said to have fallen in love with a young soldier in Ptolemy's army, a Syracusan named Menander, and whenever it did not see him to have shown its longing for him by refusing food. Also Juba records a girl selling scent who was loved by an elephant. In all these cases the animals showed their affection by their delight at the sight of the object and their clumsy gestures of endearment, and by keeping the branches given to them by the public and showering them in the loved one's lap. Nor is it surprising that animals possessing memory are also capable of affection. For the same writer records a case of an elephant's recognizing many years later in old age a man who had been its mahout in its youth, and also an instance of a sort of insight in to justice, when King Bocchus tied to stakes thirty elephants which he intended to punish and exposed them to a herd of the same number, men running out among them to provoke them to the attack, and it proved impossible to make them perform the service of ministering to another's cruelty.

VI. Italy saw elephants for the first time in the war with King Pyrrhus, and called them Lucan oxen because they were seen in Lucania, 280 BC.; but Rome first saw them at a date five years later, in a triumph, and also a very large number that were captured from the Carthaginians in Sicily by the victory of the pontiff Lucius Metellus, 252 B.C. There were 142 of them, or by some accounts 140, and they had been brought over on rafts that Metellus constructed by laying decks on rows of casks lashed together. Verrius records that they fought in the Circus and were killed with javelins, because it was not known what use to make of them, as it had been decided not to keep them nor to present them to native kings; Lucius Piso says that they were merely led into the Circus, and in order to increase the contempt felt for them were driven all round it by attendants carrying spears with a button on the point. The authorities who do not think that they were killed do not explain what was done with them afterwards.

7. There is a famous story of one of the Romans fighting single-handed against an elephant, on the occasion when Hannibal had compelled his prisoners from our army to fight duels with one another. For he pitted one survivor against an elephant, and this man, having secured a promise of his freedom if he killed the animal, met it single-handed in the arena and much to the chagrin of the Carthaginians dispatched it. Hannibal realized that reports of this encounter would bring the animals into contempt, so he sent horsemen to kill the man as he was departing. Experiences in our battles with Pyrrhus made it clear that it is very easy to lop off an elephant's trunk. Fenestella states that the first elephant fought in the circus at Rome in the curule aedileship of Claudius Pulcher and the consulship of Marcus Antonius and Aulus Postumius, 99 BC., and also that the first fight of an elephant against bulls was twenty years later in the curule aedileship of the Luculli. Also in Pompey's second consulship, at the dedication of the Temple of Venus Victrix, twenty, or, as some record, seventeen, fought in the Circus, their opponents being Gaetulians armed with javelins, one of the animals putting up a marvellous fightits feet being disabled by wounds it crawled against the hordes of the enemy on its knees. snatching their shields from them and throwing them into the air, and these as they fell delighted the spectators by the curves they described, as if they were being thrown by a skilled juggler and not by an infuriated wild animal. There was also a marvellous occurrence in the case of another, which was killed by a single blow, as the javelin striking it under the eye had reached the vital parts of the head. The whole band attempted to burst through the iron palisading by which they were enclosed and caused considerable trouble among the public. Owing to this, when subsequently Caesar in his dictatorship was going to exhibit a similar show he surrounded the arena with channels of water; these the emperor Nero removed when adding special places for the Knighthood. But Pompey's elephants when they had lost all hope of escape tried to gain the compassion of the crowd by indescribable gestures of entreaty, deploring their fate with a sort of wailing, so much to the distress of the public that they forgot the general and his munificence carefully devised for their honour, and bursting into tears rose in a body and invoked curses on the head of Pompey for which he soon afterwards paid the penalty. Elephants also fought for the dictator Caesar in his third consulship, twenty being matched against 500 foot soldiers, and on a second occasion an equal number carrying castles each with a garrison of 60 men, who fought a pitched battle against the same number of infantry as on the former occasion and an equal number of cavalry; and subsequently for the emperors Claudius and Nero elephants versus men single-handed, as the crowning exploit of the gladiators' careers.

A story is told that the animal's natural gentleness towards those not so strong as itself is so great that if it gets among a flock of sheep it will remove with its trunk those that come in its way, so as not unwittingly to crush one. Also they never do any harm unless provoked, and that although they go about in herds, being of all animals the least solitary in habit. When surrounded by horsemen they withdraw. The weak ones or those that are exhausted or wounded into the middle of their column, and advance into the fighting line in relays as if by command or strategy.

When captured they are very quickly tamed by means of barley juice.

8. The method of capturing them in India is for a mahout riding one of the domesticated elephants to find a wild elephant alone or detach it from the herd and to flog it, and when it is tired out he climbs across on to it and manages it as he did his previous mount. Africa captures elephants by means of pitfalls; when an elephant straying from the herd falls into one of these all the rest at once collect branches of trees and roll down rocks and construct ramps, exerting every effort in the attempt to get it out. Previously for the purpose of taming them the kings used to round them up with horsemen into a trench made by hand so as to deceive them by its length, and when they were enclosed within its banks and ditches they were starved into submission; the proof of this would be if when a man held out a branch to them they gently took it from him. At the present day hunters for the sake of their tusks shoot them with javelins in the foot, which in fact is extremely soft. The Cavemen on the frontier of Ethiopia, whose only food is elephant meat obtained by hunting, climb up trees near the elephants' track and there keep a look out for the last of the whole column and jump down on to the hind part of its haunches; the tail is grasped in the man's left hand and his feet are planted on the animal's left thigh, and so hanging suspended, with his right hand and with a very sharp axe he hamstrings one leg, and as the elephant runs forward with its leg crippled he strikes the sinews of the other leg, performing the whole of these actions with extreme rapidity. Others employing a safer but less reliable method fix great bows rather deep in the ground, unbent; these are held in

position by young men of exceptional strength, while others striving with a united effort bend them, and as the elephants pass by they shoot them with hunting-spears instead of arrows and afterwards follow the tracks of blood.

9. The females of the genus elephant are much more timid than the males. Mad elephants can be tamed by hunger and blows, other elephants being brought up to one that is unmanageable to restrain it with chains. Besides this they get very wild when in heat and overthrow the stables of the Indians with their tusks. Consequently they prevent them from coupling, and keep the herds of females separate, in just the same way as droves of cattle are kept. Male elephants when broken in serve in battle and carry castles manned with armed warriors on their backs; they are the most important factor in eastern warfare, scattering the ranks before them and trampling armed soldiers underfoot. Nevertheless they are scared by the smallest squeal of a pig; and when wounded and frightened they always give ground, doing as much damage to their own side as to the enemy. African elephants are afraid of an Indian elephant, and do not dare to look at it, as Indian elephants are indeed of a larger size.

10. Their period of gestation is commonly supposed to be ten years, but Aristotle puts it at two years, and says that they never bear more than one at a time, and that they live 200 and in some cases 300 years. Their adult life begins at 60. They take the greatest pleasure in rivers and roam in the neighbourhood of streams, although at the same time they are unable to swim because of the size of their bodies, and also as they are incapable of enduring cold; this is their greatest infirmity; they are also liable to flatulence and diarrhoea, but not to other kinds of disease. I find it stated that missiles sticking in their body fall out when they drink oil, but that perspiration makes it easier for them to keep their hold. It also causes them disease to eat earth unless they chew it repeatedly; but they devour even stones, consider trunks of trees a great delicacy, and bend down the loftier palm trees by butting against them with their foreheads and when thus prostrate consume their fruit. They eat with the mouth, but they breathe and drink and smell with the organ not unsuitably called their hand. They hate the mouse worst of living creatures, and if they see one merely touch the fodder placed in their stall they refuse it with disgust. They are liable to extreme torture if in drinking they swallow a leech (the common name for which I notice has now begun to be 'bloodsucker'); when this attaches itself in the actual breathing passage it causes intolerable pain.

The hide of the back is extremely hard, but that of the belly is soft; it has no covering of bristles, not even on the tail as a guard for driving away the annoyance of fliesfor even that huge bulk is sensitive to thisbut the skin is creased, and is inviting to this kind of creature owing to its smell; consequently they stretch the creases open and let the swarms get in, and then crush them to death by suddenly contracting the creases into wrinkles. This serves them instead of tail, mane and fleece.

The tusks fetch a vast price, and supply a very elegant material for images of the gods. Luxury has also discovered another thing that recommends the elephant, the flavour in the hard skin of the trunk, sought after, I believe, for no other reason than because the epicure feels that he is munching actual ivory. Exceptionally large specimens of tusks can indeed be seen in the temples, but nevertheless Polybius has recorded on the authority of the chieftain Gulusa, that in the outlying parts of the province of Africa where it marches with Ethiopia elephants' tusks serve instead of doorposts in the houses, and partitions in these buildings and in stabling for cattle are made by using elephants' tusks for poles.

11. Elephants are produced by Africa beyond the deserts of Sidra and by the country of the Moors; also by the land of Ethiopia and the Cave-dwellers, as has been said; but the biggest ones by India, as well as serpents that keep up a continual feud and warfare with them, the serpents also being of so large a size that they easily encircle the elephants in their coils and fetter them with a twisted knot. In this duel both combatants die together, and the snaquished elephant in falling crushes with its weight the snake coiled round it.

12. Every species of animal is marvellously cunning for its own interests, as are those which we are considering. One difficulty that the serpent has is in climbing to such a height; consequently it keeps watch on the track worn by the elephant going to pasture and drops on him from a lofty tree. The elephant knows that he is badly handicapped in fighting against the snake's coils, and therefore seeks to rub it against trees or rocks. The snakes are on their guard against this, and consequently begin by shackling the elephants' steps with their tail. The elephants untie the knots with their trunk. But the snakes poke their heads right into the elephants' nostrils, hindering their breathing and at the same time lacerating their tenderest parts; also when caught in the path of the elephants they rear up against them, going specially for their eyes: this is how it comes about that elephants are frequently found blind and exhausted with hunger and wasting misery.

What other cause could anybody adduce for such quarrel save Nature arranging a match between a pair of combatants to provide herself with a show? There is also another account of this contestthat elephants are very cold-blooded, and consequently in very hot weather are specially sought after by the snakes; and that for this reason they submerge themselves in rivers and lie in wait for the elephants when drinking, and rising up coil round the trunk and imprint a bite inside the ear, because that place only cannot be protected by the trunk; and that the snakes are so large that they can hold the whole of an elephant's blood, and so they drink the elephants dry, and these when drained collapse in a heap and the serpents being intoxicated are crushed by them and die with them.

13. Ethiopia produces elephants that rival those of India, being 30 ft. high; the only surprising thing is what led Juba to believe them to be crested. The Ethiopian tribe in whose country they are chiefly bred are called the Asachaeans; it is stated that in the coast districts belonging to this tribe the elephants link themselves four or five together into a sort of raft and holding up their heads to serve as sails are carried on the waves to the better pastures of Arabia.

14. Megasthenes writes that in India snakes grow so large as to be able to swallow stags and bulls whole; and Metrodorus that in the neighbourhood of the river Rhyndacus in Pontus they catch and gulp down birds passing over them even though they are flying high and fast. There is the well-known case of the snake 120 ft. long that was killed during the Punic Wars on the River Bagradasa by General Regulus, using ordnance and catapults just as if storming a town; its skin and jawbones remained in a temple at Rome down to the Nuxnantine War? Credibility attaches to these stories on account of the serpents in Italy called boas, which reach such dimensions that during the principate of Claudius of blessed memory a whole child was found in the belly of one that was killed on the Vatican Hill. Their primary food is milk sucked from a cow; from this they derive their name.

15. It is not our concern to give a meticulous account of all the other species of animals that recently have reached Italy more frequently by importation from all quarters. Scythia, owing to its lack of vegetation, produces extremely few; its neighbour Germany few, but some remarkable breeds of wild oxen, the maned bison and the exceptionally powerful and swift aurochaff to which the ignorant masses give the name of buffalo, though the buffalo is really a native of Africa and rather bears some resemblance to the calf and the stag.

16. The North also produces herds of wild horses, as do Asia and Africa of wild asses, and also the elk, which resembles a bullock save that it is distinguished by the length of its ears and neck; also the achlis, born in the island of Scandinavia and never seen in Rome, although many have told stories of itan animal that is not unlike the elk but has no joint at the hock and consequently is unable to lie down but sleeps leaning against a tree, and is captured by the tree being cut through to serve as a trap, but which nevertheless has a remarkable turn of speed. Its upper lip is exceptionally big; on account of this it walks backward when grazing, so as to avoid getting tripped up by it in moving forward. There are reports of a wild animal in Paeonia called the bonasus, which has the mane of a horse but in all other respects resembles a bull; its horns are curved back in such a manner as to be of no use for fighting, and it is said that because of this it saves itself by running away, meanwhile emitting a trail of dung that sometimes covers a distance of as much as three furlongs, contact with which scorches pursuers like a sort of fire.

17. It is remarkable that leopards, panthers, lions and similar animals walk with the point of their claws sheathed inside the body so that they may not get broken or blunted, and run with their talons turned back and do not extend them except when attempting to catch something.

The lion is specially high-spirited at the time when its neck and shoulders are clothed with a manefor this occurs at maturity in the case of those sired by a lion, though those begotten by leopards always lack this characteristic; and the females likewise. Sexual passion is strong in this species, with its consequence of quarrelsomeness in the males; this is most observed in Africa, where the shortage of water makes the animals flock to the few rivers. There are consequently many varieties of hybrids in that country, either violence or lust mating the males with the females of each species indiscriminately. This is indeed the origin of the common saying of Greece that Africa is always producing some novelty. A lion detects intercourse with a leopard in the case of an adulterous mate by scent, and concentrates his entire strength on her chastisement; consequently this guilty stain is washed away in a stream, or else she keeps her distance when accompanying him. But I notice that there used to be a popular belief that the lioness only bears a cub once, as her womb is wounded by the points of its claws in delivery. Aristotle, however, whose authority I feel bound to cite first as I am going in great part to follow him on these subjects, gives a different account. King Alexander the Great being fired with a desire to know the natures of animals and having delegated the pursuit of this study to Aristotle as a man of supreme eminence in every branch of science, orders were given to some thousands of persons throughout the whole of Asia and Greece, all those who made their living by hunting,

fowling, and fishing and those who were in charge of warrens, herds. apiaries, fishponds and aviaries, to obey his instructions, so that he might not fail to be informed about any creature born anywhere. His enquiries addressed to those persons resulted in the composition of his famous works on zoology, in nearly 50 volumes. To my compendium of these, with the addition of facts unknown to him. I request my readers to give a favourable reception, while making a brief excursion under our direction among the whole of the works of Nature, the central interest of the most glorious of all sovereigns. Aristotle then states that a lioness at the first birth produces five cubs, and each year one fewer, and after bearing a single cub becomes barren; and that the cubs are mere lumps of flesh and very small, at the beginning of the size of weasels, and at six months are scarcely able to walk, not moving at all until they are two months old; also that lions are found in Europe only between the rivers Achelous and Mestus, but that these far exceed in strength those produced by Africa and Syria.

18. He states that there are two kinds of lions, one thickset and short, with comparatively curly manesthese being more timid than the long, straight-haired kind; the latter despise wounds. The males lift one leg in making water, like dogs. Their smell is disagreeable, and not less their breath. They are infrequent drinkers, and they feed every other day, after a full meal occasionally abstaining from food for three days; when chewing they swallow whole what they can, and when their belly will not contain the result of their gluttony, they insert their clenched claws into their throats and drag it out, so that if they have to run away they may not go in a state of repletion. From the fact that many specimens are found lacking teeth he infers that they are long-lived. Aemilianus's companion Polybius states that in old age their favourite prey is a human being, because their strength is not adequate to hunting wild animals; and that at this period of their lives they beset the cities of Africa, and consequently when he was with Scipio he saw lions crucified, because the others might be deterred from the same mischief by fear of the same penalty.

19. The lion alone of wild animals shows mercy to suppliants; it spares persons prostrated in front of it, and when raging it turns its fury on men rather than women, and only attacks children when extremely hungry. Juba believes that the meaning of entreaties gets through to them: at all events he was informed that the onset of a herd of lions in the forests upon a woman of Gaetulia who was captured and got away again had been checked by a speech in which she dared to say that she was a female, a fugitive, a weakling a suppliant to the most generous of all the animals. the lord of all the rest. a booty unworthy of his glory. Opinion will vary in accordance with each person's as experience has not decided whether it be true or false that even serpents can be enticed out by song and forced to submit to chastisement. Lions indicate their state of mind by means of their tail, as horses do by their ears: for Nature has assigned even these means of expression to all the noblest animals. Consequently the lion's tail is motionless when he is calm, and moves gently when he wishes to cajolewhich is seldom, since anger is more usual; at the onset of which the earth is lashed, and as the anger grows, his back is lashed as if for a mode of incitement. A lion's greatest strength is in the chest. Black blood flows from every wound, whether made by claw or tooth. Yet when lions are glutted they are harmless. The lion's nobility of spirit is detected most in dangers, not merely in the way that despising weapons he protects himself for a long time only by intimidation, and protests as it were that he is acting under compulsion, and rises to the encounter not as if forced by danger but as though enraged by madness; but a nobler indication of this spirit is this, that however large a force of hounds and hunters besets him, in level plains and where he can be seen he retires contemptuously and constantly halting. but when he has made his way into brushwood and forest he proceeds at top speed, as if aware that the lie of the land conceals his disgrace. When pursuing he advances by leaps and bounds, but he does not use this gait when in flight. When he has been wounded he marks down his assailant in a marvellous way, and knows him and picks him out in however large a him but fails to wound him he seizes and whirling him round flings him on the ground, but does not wound him. It is said that when a mother lion is fighting in defence of her cubs she fixes the gaze of her eyes upon the ground so as not to flinch from the hunting spears. Otherwise lions are devoid of craft and suspicion, and they do not look at you with eyes askance and dislike being looked at in a similar way. The belief has been held that a dying lion bites the earth and bestows a tear upon death. Yet though of such a nature and of such ferocity this animal is frightened by wheels turning round and by empty chariots, and even more by the crested combs and the crowing of cocks, but most of all by fires. The only malady to which it is liable is that of distaste for food in this condition it can be cured by insulting treatment, the pranks of monkeys tied to it driving it to fury; and then tasting their blood acts as a remedy.

20. A fight with several lions at once was first the bestowed on Rome by Quintus Scaevola, son of Publius, when consular

aedile, but the first of all who exhibited a combat of 100 maned lions was Lucius Sulla, later dictator, in his praetorship. After Sulla Pompey the Great showed in the Circus 600, including 315 with manes, and Caesar when dictator 400.

21. Capturing lions was once a difficult task, chiefly effected by means of pitfalls. In the principate of Claudius accident taught a Gaetulian shepherd a method that was almost one to be ashamed of in the case of a wild animal of this nature: when it charged he flung a cloak against its onseta feat that was immediately transferred to the arena as a showthe creature's great ferocity abating in an almost incredible manner when its head is covered with even a light wrap, with the result that it is vanquished without showing fight. The fact is that all its strength is concentrated in its eves, which makes it less remarkable that when Lysimachus by order of Alexander was shut up in a lion's cage he succeeded in strangling it. Mark Antony broke lions to the yoke and was the first person at Rome to harness them to a chariot, and this in fact during the civil war, after the decisive battle in the plains of Pharsalia, not without some intention of exhibiting the position of affairs, the portentous feat signifying that generous spirits can bow to a yoke. For his riding in this fashion with the actress Cytheris at his side was a thing that outdid even the portentous oecnrrences of that disastrous period. It is recorded that Hanno, one of the most distinguished of the Carthaginians, was the first human being who dared to handle a lion and exhibit it as tamed, and that this supplied a reason for his impeachment, because it was felt that a man of such an artful character might persuade the public to anything, and that their liberty was ill entrusted to one to whom even ferocity had so completely submitted.

But there are also instances of occasional mercifulness even in lions. The Syracusan Mentor in Syria met a lion that rolled on the ground in suppliant wise and struck such terror into him that he was running away, when the lion stood in his way wherever he turned, and licked his footsteps as if fawning on him; he noticed a swelling and a wound in its foot, and by pulling out a thorn set the creature free from torment: a picture at Syracuse is evidence of this occurrence. In a similar manner a native of Samos named Elpis on landing from a ship in Africa, saw near the coast a lion opening its jaws in a threatening way, and took refuge up a tree, calling on Father Liber for help, since the chief occasion for praying is an emergency where there is no room for hope. The beast had not stood in his way when he tried to run away although it might have done, and lying down by the tree began to beg for compassion with the gaping jaws by which it had scared the man. Owing to its biting its food too greedily a bone had stuck in its teeth, and was tormenting it with starvation and not merely with the punishment contained in the actual prickles, as it gazed up and looked as if making a silent prayer for aidwhile chance events are not to be relied on in face of a wild animal, and much longer hesitation is caused by surprise than by alarm. But finally he came down and pulled out the bone for the lion, which held out its foot to him and adjusted it at the most necessary angle; and they say that as long as that vessel remained on the coast the lion displayed its gratitude by bringing its catches to its benefactor. This led Elpis to consecrate in Samos a temple to Father Liber, to which from that occurrence the Greeks have given the name of Temple of Dionysus with his Mouth Open. After this do not let us be surprised that men's tracks are recognized by wild beasts when they actually hope for assistance from one of the animal race: for why did they not go to other animals, or how do they know of man's healing touch? Unless perchance violent maladies force even wild animals to every expedient.

The natural philosopher Demetrius also records an equally remarkable story about a panther, which out of desire for human aid lay in the middle of a road, where the father of a certain student of philosophy named Philinus suddenly came in sight of it. The man, so the story goes, began to retreat, but the animal rolled over on its back, obviously trying to cajole him, and tormented by sorrow that was intelligible even in a panther: she had a litter of cubs that had fallen into a pit some distance away. The first result of his compassion therefore was not to be frightened, and the next to give her his attention; and he followed where she drew him by lightly touching his clothes with her claws, and when he understood the cause of her grief and at the same time the recompense due for his own security, he got the cubs out of the pit; and the panther with her young escorted him right to the edge of the desert. guiding him with gestures of delight that made it quite clear that she was expressing gratitude and not reckoning on any recompense, which is rare even in a human being.

22. These stories give credibility to Democritus also, who tells a tale of Thoas in Arcadia being saved by a snake. When a boy he had fed it and made a great pet of it, and his parent being afraid of the snake's nature and size had taken it away into an uninhabited region, where it recognized Thoas's voice and came to his rescue when he was entrapped by an ambush of brigands. For as to the reports about infants when they had been exposed being fed by the milk of wild animals, as well as those about our founders being nursed by a he-wolf, I deem it

more reasonable for them to be credited to the grandeur of their destinies than to the nature of the wild animals.

23. The panther and the tiger almost alone of beasts are distinguished by a variety of markings, whereas the rest have a single colour, each kind having its ownblack in the case of lions in Syria only. Panthers have small spots like eyes on a light ground. It is said that all four-footed animals are wonderfully attracted by their smell, but frightened by the savage appearance of their head; for which they catch them by hiding their head and enticing them to approach by their other attractions. Some authorities report that they have a mark on the shoulder resembling a moon, expanding into a circle and hollowed out in a similar manner. As it is, people use the name 'spotted ladies', and for the males 'pards', in the whole of this genus, which occurs most frequently in Africa and Syria; some persons distinguish panthers from these by their light colour only, nor have I hitherto discovered any other difference.

24. There was an old Resolution of the Senate prohibiting the importation of African elephants into Italy. Gnaeus Aufidius when Tribune of the Plebs carried in the Assembly of the People a resolution repealing this and allowing them to be imported for shows in the Circus. But Scaurus in his aedileship first sent in procession 150 female leopards in one flock, then Pompey the Great 410, and the late lamented Augustus 420.

25. Augustus also, in the consulship of Marcus Tubero and Paullus Fabius, at the dedication of the Theatre of Marcellus, on May 7, was the first of all persons at Rome who exhibited a tamed tiger in a cage, although his late Majesty Claudius exhibited four at one time.

Hyrcania and India produce the tiger, au animal of terrific speed, which is most noticeable when the whole of its litter, which is always numerous, is being captured. The litter is taken by a man lying in wait with the swiftest horse obtainable, and is transferred successively to fresh horses. But when the mother tiger finds the lair empty (for the males do not look after their young) she rushes off at headlong speed, tracking them by scent. The captor when her roar approaches throws away one of the cubs. She snatches it up in her mouth, and returns and resumes the pursuit at even a faster pace owing to her burden, and so on in succession until the hunter has regained the ship and her ferocity rages vainly on the shore.

26. The East pastures camels among its flocks of cattle; of these there are two kinds, the Bactrian and the Arabian, which differ in that the former have two humps on the back and the latter one with a second hump beneath the chest on which they can rest their weight; but both kinds resemble oxen in having no teeth in the upper jaw. All however perform the services of beasts of burden, and also of cavalry in battles; their speed is below that of horses. But the two kinds differ in dimensions, as also in strength; and a camel will not travel beyond its customary march, nor carry more than the regulation load. They possess an innate hatred for horses. They can endure thirst for as much as four days, and when they have an opportunity they replenish themselves both for the past interval and for the future, stirring up the water by trampling with their fore feet before they drinkotherwise they do not enjoy the draught. They live for fifty years, some even for a hundred; although even camels are liable to rabies. A method has been discovered of gelding even the females intended for war; this by denying them intercourse increases their strength.

27. Some resemblance to these is passed on to two animals. The Ethiopians give the name of to one that has a neck like a horse, feet and legs like an ox, and a head like a camel, and is of a ruddy colour picked out with white spots, owing to which it is called a camelopard; it was first seen at Rome at the games in the Circus given by Caesar when dictator. From this it has subsequently been recognized to be more remarkable for appearance than for ferocity, and consequently it has also got the name of wild sheep.

28. The games of Pompey the Great first displayed the chama, which the Gauls used to call the lynx, with the shape of a wolf and leopard's spots; the same show exhibited what they call cephi from Ethiopia, which have hind feet resembling the feet of a man and legs and fore feet like hands. Rome has not seen this animal subsequently.

29. At the same games there was also a rhinoceros with one horn on the nose such as has often been seen. Another bred here to fight matches with an elephant gets ready for battle by filing its horns on rocks, and in the encounter goes specially for the belly, which it knows to be softer. It equals an elephant in length, but its legs are much shorter, and it is the colour of box-wood.

30. Ethiopia produces lynxes in great numbers, and sphinxes with brown hair and a pair of udders on the breast, and many other monstrositieswinged homes armed with horns, called pegasi, hyenas like a cross between a dog and a wolf, that break everything with their teeth, swallow it at a gulp and masticate it in the belly; tailed monkeys with black heads, ass's hair and a voice unlike that of any other species of ape; Indian oxen a with one and with three horns; the leucrocota, [hyena] swiftest of wild beasts, about the size of an ass, with a stag's haunches, a lion's neck, tail and breast, badger's head. cloven hoot mouth opening right back to the ears, and ridges of bone in place of rows of teeththis animal is reported to imitate the voices of human beings. Among the same people is also found the animal called the yale, the size of a hippopotamus, with an elephant's tail, of a black or tawny colour, with the jaws of a boar and movable horns more than a cubit in length which in a fight are erected alternately, and presented to the attack or sloped backward in turn as policy directs. But its fiercest animals are forest bulls, larger than the bulls of the field, surpassing all in speed, of a tawny colour, with blue eyes, hair turned backward, mouth gaping open to the ears, along with mobile horns; the hide has the hardness of flint, rejecting every wound. They hunt all wild animals, but themselves can only be caught in pits, and when caught always die game. Ctesias writes that in the same country is born the creature that he calls the mantichora [fabulous] which has a triple row of teeth meeting like the teeth of a comb, the face and ears of a human being, grey eyes, a blood-red colour, a lion's body, inflicting stings with its tail in the manner of a scorpion, with a voice like the sound of a panpipe blended with a trumpet, of great speed, with a special appetite for human flesh.

31. He says that in India there are also oxen with solid hoofs and one horn and a wild animal named axis, [deer] with the hide of a fawn but with more spots and whiter ones, belonging to the ritual of Father Liber (the Orsaean Indians hunt monkeys that are a bright white all over the body); but that the fiercest animal is the unicorn, which in the rest of the body resembles a horse, but in the head a stag, in the feet an elephant, and in the tail a boar, and has a deep bellow, and a single black horn three feet long projecting from the middle of the forehead. They say that it is impossible to capture this animal alive.

32. In Western Ethiopia there is a spring, the Nigris, which most people have supposed to be the source of the Nile, as they try to prove by the arguments that we have stated. In its neighbourhood there is an animal called the catoblepas, in other respects of moderate size and inactive with the rest of its limbs, only with a very heavy head which it carries with difficultyit is always hanging down to the ground; otherwise it is deadly to the human race, as all who see its eyes expire immediately.

33. The basilisk serpent also has the same power. It is a native of the province of Cyrenaica, not more than 12 inches long, and adorned with a bright white marking on the head like a sort of diadem. It routs all snakes with its hiss and does not move its body forward in manifold coils like the other snakes but advancing with its middle raised high. It kills bushes not only by its touch but also by its breath, scorches up grass and bursts rocks. Its effect on other animals is disastrous: it is believed that once one was killed with a spear by a man on horseback and the infection rising through the spear killed not only the rider but also the horse. Yet to a creature so marvellous as this indeed kings have often wished to see a specimen when safely deadthe venom of weasels is fatal: so fixed is the decree of nature that nothing shall be without its match. They throw the basilisks into weasels' holes, which are easily known by the foulness of the ground, and the weasels kill them by their stench and die themselves at the same time. and nature's battle is accomplished.

34. But in Italy also it is believed that the sight of wolves is harmful, and that if they look at a man before he sees them, it temporarily deprives him of utterance. The wolves produced in Africa and Egypt are feeble and small, but those of colder regions are cruel and fierce. We are bound to pronounce with confidence that the story of men being turned into wolves and restored to themselves again is falseor else we must believe all the tales that the experience of so many centuries has taught us to be fabulous; nevertheless we will indicate the origin of the popular belief, which is so firmly rooted that it classes werewolves among persons under a curse. Evanthes, who holds no contemptible position among the authors of Greece, writes that the Arcadians have a tradition that someone chosen out of the clan of a certain Anthus by casting lots among the family is taken to a certain marsh in that region, and hanging his clothes on an oak-tree swims across the water and goes away into a desolate place and is transformed into a wolf and herds with the others of the same kind for nine years; and that if in that period he has refrained from touching a human being, he returns to the same marsh, swims across it and recovers his shape, with nine years' age added to his former appearance; Evanthes also adds the more fabulous detail that he gets back the same clothes. It is astounding to what lengths Greek credulity will go; there is no lie so shameless as to lack a supporter. Similarly Apollas the author of Olympic Victors relates that at the sacrifice which even at that date the Arcadians used to perform in honour of Lycaean Jove with a human victim, Daemenetus of Parrhasia tasted the vitals of a boy who had been offered as a victim and turned himself into a wolf, and furthermore that he was restored ten years later and trained himself in athletics for boxing and returned a winner from Olympia. Moreover it is popularly

believed that even the tail of this animal contains a lovepoison in a small tuft of hair, and when it is caught it sheds the tuft, which has not the same potency unless plucked from the animal while it is alive; that the days on which it breeds are not more than twelve in a whole year; also that for it to feed on earth when it is hungry counts as an augury: if it does this in large mouthfuls when barring the path of travellers who come upon it on their right hand side, this is the finest of all omens. Some members of the genus are called stag-wolves; a specimen from Gaul was seen in the arena of Pompey the Great, as we have stated. They say that if this animal while devouring its food looks behind it, however hungry it is, forgetfulness of what it is eating creeps over it and it goes off to look for something else.

35. As concerning serpents, it is generally stated that most of them have the colour of the earth that they usually lurk in; that there are innumerable kinds of them; that horned snakes have little horns, often a cluster of four, projecting from the body, by moving which so as to hide the rest of the body they lure birds to them; that the amphisbaena has a twin he ad, that is one at the tail-end as well, as though it were not enough for poison to be poured out of one mouth; that some have scales, others coloured markings, and all a deadly venom; that the javelin-shake hurls itself from the branches of trees, and at serpents are not only formidable to the feet but fly like a missile from a catapult; that when asps' necks swell, up there is no remedy for their sting except the immediate amputation of the parts stung. Although so pestilential, this animal has one emotion or rather affection: they usually roam in couples, male and female, and only live with their consort. Accordingly when either of the pair has been destroyed the other is incredibly anxious for revenge: it pursues the murderer and by means of some mark of recognition attacks him and him only in however large a throng of people, bursting through all obstacles and traversing all distances, and it is only debarred by rivers or by very rapid flight. It is impossible to declare whether Nature has engendered evils or remedies more bountifully. In the first place she has bestowed on this accursed creature dim eyes, and those not in the forehead for it to look straight in front of it, but in the templesand consequently it is more quickly excited by hearing than by sight; and in the next place she has given it war to the death with the ichneumon.

36. That animal, which is also a native of Egypt, is specially known because of this exploit. The asp repeatedly plunges into mud and dries itself in the sun, and then when it has equipped itself with a cuirass of several coatings by the same method, it proceeds to the encounter. In this it raises its tail and renders the blows it receives ineffectual by turning away from them, till after watching for its opportunity, with head held sideways it attacks its adversary's throat. And not content with this victim it vanquishes another animal no less ferocious, the crocodile.

37. This belongs to the Nile; it is a curse on four legs, and equally pernicious on land and in the river. It is the only land animal not furnished with a tongue and the only one that bites by pressing down the mobile upper jaw, and it is also formidable because of its row of teeth set close together like a comb. In size it usually exceeds 18 ells. It lays as many eggs as a goose, and by a kind of prophetic instinct incubates them always outside the line to which the Nile in that year is going to rise at full flood. Nor does any other animal grow to greater dimensions from a smaller original size; however, it is armed with talons as well, and its hide is invincible against all blows. It passes its days on land and its nights in the water, in both eases for reasons of warmth. This creature when sated with a meal of fish and sunk in sleep on the shore with its mouth always full of food, is tempted by a small bird (called there the trochilus, but in Italy the king-bird) to open its mouth wide to enable the bird to feed; and first it hops in and cleans out the mouth, and then the teeth and inner throat also, [fictitious] which yawns open as wide as possible for the pleasure of this scratching; and the ichneumon watches for it to be overcome by sleep in the middle of this gratification and darts like a javelin through the throat so opened and gnaws out the belly.

38. A native of the Nile resembling the crocodile but smaller even than the ichneumon is the skink, which is an outstanding antidote against poisons, and also an aphrodisiac for males.

But the crocodile constituted too great a plague for Nature to be content with a single enemy for it. Accordingly dolphins also, which have on their backs a sharp fin shaped like a knife as if for this purpose, enter the mouth of the Nile, and when the crocodiles drive them away from their prey and lord it in the river as merely their own domain, kill them by craft, as they are otherwise in themselves no match for them in strength. For all animals are skilful in this, and know not only the things advantageous for themselves but also those detrimental for their enemies, and are acquainted with their own weapons and recognize their opportunities and the unwarlike parts of their adversaries. The crocodile's hide is soft and thin over the belly; consequently the dolphins pretending to be frightened dive and going under them rip the belly with the spine described. Moreover there is also a tribe of human beings right on the Nile, named after the Island of Tentyrus on which it dwells, that is hostile to this monster. They are of small stature but have a readiness of mind in this employment only that is remarkable. The creature in question is terrible against those who run away but runs away from those who pursue it. But these men alone dare to go against them; they actually dive into the river and mounting on their back as if riding a horse, when they vawn with the head thrown backward to bite, insert a staff into the month, and holding the staff at both ends with their right and left hands, drive their prisoners to the land as if with bridles, and by terrifying them even merely with their shouts compel them to disgorge the recently swallowed bodies for burial. Consequently this island only is not visited by crocodiles, and the scent of this race of men drives them away, as that of the Psylli does snakes. This animal is said to have dim sight in the water, but to be very keen-sighted when out of it; and to pass four months of the winter in a cave continuously without food. Some persons think that this alone of animals goes on growing in size as long as it lives; but it lives a long time

39. A monster of still greater height is also produced in the Nile, the hippopotamus, which has cloven hoofs like those of oxen, a horse's back, mane and neigh, a snub snout, a boar's tail and curved-tusks, though these are less formidable, and with a hide that supplies an impenetrable material for shields and helmets, except if they are soaked in moisture. It feeds on the crops, marking out a definite portion beforehand for each day, so it is said, and making its footprints lead out of the field, so that no traps may be laid for it when it returns.

40. A hippopotanus was exhibited at Rome for the first time, together with five crocodiles, by Marcus Scaurus at the games which he gave when aedile; a temporary channel was made to hold them. The hippopotanus stands out as an actual master in one department of medicine; for when its unceasing voracity has caused it to overeat itself it comes ashore to reconnoitre places where rushes have recently been cut, and where it sees an extremely sharp stalk it squeezes its body down on to it and makes a wound in a certain vein in its leg, and by thus letting blood unburdens its body, which would otherwise be liable to disease, and plasters up the wound again with mud.

41. A somewhat similar display has also been made in the same country of Egypt by the bird called the ibis, which makes use of the curve of its beak to purge itself through the part by which it is most conducive to health for the heavy residue of foodstuffs to be excreted. Nor is the ibis alone, but many animals have made discoveries destined to be useful for man as well. The value of the herb dittany for extracting arrows was shown by stags when wounded by that weapon and ejecting it by grazing on that herb; likewise stags when bitten by the phalangium, a kind of spider, or any similar animal cure themselves by eating crabs. There is also a herb that is particularly good for snakebites, with which lizards heal themselves whenever they fight a battle with snakes and are wounded. Celandine was shown to be very healthy for the sight by swallows using it as a medicine for their chicks' sore eyes. The tortoise eats cunila, called ox-grass, to restore its strength against the effect of snake-bites; the weasel cures itself with rue when it has had a fight with mice in hunting them. The stork drugs itself with marjoram in sickness, and goats use ivy and a diet consisting mostly of crabs thrown up from the sea. When a snake's body gets covered with a skin owing to its winter inactivity it sloughs this hindrance to its movement by means of fennel-sap and comes out all glossy for spring; but it begins the process at its head, and takes at least 24 hours to do it, folding the skin backward so that what was the inner side of it becomes the outside. Moreover as its sight is obscured by its hibernation it anoints and revives its eves by rubbing itself against a fennel plant, but if its scales have become numbed it scratches itself on the spiny leaves of a juniper. A large snake quenches its spring nausea with the juice of wild lettuce. Barbarian hunters catch leopards by means of meat rubbed over with wolfs bane: their throats are at once attacked by violent pain (in consequence of which some people have given this poison a Greek name meaning choke-leopard), but to cure this the creature doses itself with human excrement, and in general it is so greedy for this that shepherds have a plan of hanging up some of it in a vessel too high for the leopard to be able to reach it by jumping up, and the animal keeps springing up and trying to get it till it is exhausted and finally dies, although otherwise its vitality is so persistent that it will go on fighting for a long time after its entrails have been torn out. When an elephant swallows a chameleon (which is poisonous to it) because it is of the same colour as a leaf, it uses the wild olive as a remedy. When bears have swallowed the fruit of the mandrake they lick up ants. A stag uses wild artichoke as an antidote to poisoned fodder. Pigeons, jays, blackbirds and partridges cure their yearly distaste for food with bay-leaves; doves, turtle-doves and domestic fowls use the plant called helxine, ducks, geese and other water-fowl water-starwort, cranes and the like marshrushes. When a raven has killed a chameleon lizard, which is

noxious even to its conqueror, it stanches the poisonous infection with bay-leaves.

42. There are thousands of points besides, inasmuch as Nature has likewise also bestowed upon very many animals the faculty of observing the sky, and a variety of different modes of prognosticating winds, rain and storms, a subject which it would be an immense task to pursue, just as much so no doubt as the other points of alliance between particular animals and human beings. For in fact animals even give warning of dangers in advance, not only by means of their entrails and internal organs, a thing that much intrigues a great part of mankind, but also by another mode of indication. When the collapse of a building is imminent, the mice migrate in advance, and spiders with their webs are the first things to fall. Indeed auguries have constituted a science at Rome and have given rise to a priestly college of the greatest dignity. In frostbound countries, the fox also is among the creatures believed to give omens, being an animal of formidable sagacity in other respects; people only cross frozen rivers and lakes at points where it goes or returns: it has been observed to put its ear to the frozen surface and to guess the thickness of the ice.

43. Nor are there less remarkable instances of destructiveness even in the case of contemptible animals. Marcus Varro states that a town in Spain was undermined by rabbits and one in Thessaly by moles, and that a tribe in Gaul was put to flight by frogs and one in Africa by locusts, and the inhabitants were banished from the island of Gyara in the Cyclades by mice, and Amynclae in Italy was completely destroyed by snakes. North of the Ethiopic tribe of the Bitch-milkers there is a wide belt of desert where a tribe was wiped out by scorpions and poisonous spiders, and Theophrastus states that the Rhoetienses were driven away by a kind of centipede.

But let us return to the remaining kinds of wild animals.

44. The hyena is popularly believed to be bisexual and to become male and female in alternate years, the female bearing offspring without a male; but this is denied by Aristotle. Its neck stretches right along the backbone like a mane, and cannot bend without the whole body turning round. A number of other remarkable facts about it are reported, but the most remarkable are that among the shepherds' homesteads it simulates human speech, and picks up the name of one of them so as to call him to come out of doors and tear him in pieces, and also that it imitates a person being sick, to attract the dogs so that it may attack them; that this animal alone digs up graves in search of corpses; that a female is seldom caught: that its eves have a thousand variations and alterations of colour: moreover that when its shadow falls on dogs they are struck dumb; and that it has certain magic arts by which it causes every animal at which it gases three times to stand rooted to the spot.

45. When crossed with this race of animals the Ethiopian lioness gives birth to the corocotta, that mimics the voices of men and cattle in a similar way. It has an unbroken ridge of bone in each jaw, forming a continuous tooth without any gum, which to prevent its being blunted by contact with the opposite jaw is shut up in a sort of case. Juba states that in Ethiopia the mantichora also mimics human speech.

46. Hyenas occur most numerously in Africa, which also produces a multitude of wild asses. In that species each male is lord of a separate herd of females. They are afraid of rivals in their affections, and consequently they keep a watch on their females when in foal, and geld their male offspring with a bite; to guard against this the females when in foal seek hiding-places and are anxious to give birth by stealth. Also they are fond of a great deal of sexual indulgence.

47. The beavers of the Black Sea region practise selfamputation of the same organ when beset by danger, as they know that they are hunted for the sake of its secretion, the medical name for which is beaver-oil. Apart from this the beaver is an animal with a formidable bite, cutting down trees on the river banks as if with steel; if it gets hold of part of a man's body it does not relax its bite before the fractured bones are heard grinding together. The beaver has a fish's tail, while the rest of its conformation resembles an otter's; both species are aquatic, and both have fur that is softer than down.

48. Also the bramble-frog, which is amphibious in its habit, is replete with a great number of drugs, which it is said to evacuate daily and to replace by the food that it eats, always keeping back only the poisons for itself.

49. The seal also resembles the beaver both in its amphibious habits and in its nature. It gets rid of its gall, which is useful for many drugs, by vomiting it up, and also its rennet, a cure for epileptic attacks; it does this because it knows that it is bunted for the sake of these products. Theophrastus states that geckoes also slough off their old skin as a snake does, and similarly swallow the slough at once, it being a cure for epilepsy if one snatches it from them. It is also said that their bite is harmless in Greece but that they are noxious in Sicily.

50. Deer also a have their own form of stinginess although the stag is the gentlest of animals. When beset by a pack of hounds they fly for refuge of their own accord to a human being, and when giving birth to young are less careful to avoid paths worn by human footprints than secluded places that are advantageous for wild beasts. The mating season is after the rising of Arcturus. Pregnancy lasts eight months, and occasionally they bear twins. After mating the hinds withdraw, but the deserted males rage in a fury of desire, and score the ground with their horns; afterwards their snouts are black till a considerable rainfall washes off the dirt. The females before giving birth use a certain plant called hartwort as a purge, so having an easier delivery. After giving birth they browse on the two plants named dittany and seseli before they return to the young: for some reason or other they desire the sucklings' first draughts of milk to be flavoured with those herbs. When the fawns are born they exercise them in running and teach them to practise escaping, and take them to cliffs and show them how to jump. The males when at last freed from lustful desire greedily seek pasture; when they feel they are too fat, they look for lairs to hide in, showing that they are conscious of inconvenient weight. And on other occasions when running away from pursuit they always stop and stand gazing backward, when the hunters draw near again seeking refuge in flight: this is done owing to pain in the gut, which is so weak that a light blow causes internal rupture. But when they hear the baying of hounds they always run away down wind, so that their scent may go away with them. They can be charmed by a shepherd's pipe and by song. Their hearing is very keen when they raise their ears, but dull when they drop them. In other respects the deer is a simple animal and stupefied by surprise at everythingso much so that when a horse or a heifer is approaching they do not notice a huntsman close to them, or if they see him merely gaze in wonder at his bow and arrows. They cross seas swimming in a herd strung out in line with their heads resting on the haunches of the ones in front of them, and taking turns to drop to the rear: this is most noticed when they are crossing from Cilicia to Cyprus: and they do not keep land in sight but swim towards its scent. The males have horns, and alone of animals shed them every year at a fixed time in spring; consequently when the day in question approaches they resort as much as possible to unfrequented places. When they have lost their home they keep in hiding as if disarmedalthough these animals also are grudging of their special good: people say that a stag's right horn, which is endowed with some sort of healing drug, is never found; and this must be confessed to be the more surprising in view of the fact that even stags kept in warrens change their horns every year: it is thought that they bury them. The smell of either horn when burnt arrests attacks of epilepsy. They also bear marks of their age in their horns, each year till they are six years old adding one time: though thenceforward the horns grow again like the old ones and the age cannot be told by them. But old age is indicated by the teeth, for the old have either few or none, nor have they tines at the bottom of the horns, though otherwise these usually jut out in front of the brow when they are younger. When stags have been gelt the horns do not fall off nor grow again, but burst out with excrescences that keep springing again, at first resembling dry skin, and then grow up with tender shoots into reedy tufts feathered with soft down. As long as the stags are without them, they go out to graze iu the nights. When they are growing again they harden them with the heat of the sun, subsequently testing them on trees, and only go out into the open when satisfied with theft strength: and before now they have been caught with green ivy on their antlers, that has been grafted on the tender horns as on a log of wood as a result of rubbing them against trees while testing them. Stags are sometimes even of a white colour, as Quintus Sertorius's hind is said to have been which he had persuaded the tribes of Spain to believe prophetic. Even stags are at war with a snake; they track out their holes and draw them out by means of the breath of their nostrils in spite of their resistance. Consequently the smell made by burning stag's horn is an outstanding thing for driving away serpents, while a sovereign cure against bites is obtained from the rennet of a fawn killed in its mother's womb. Stags admittedly have a long life, some having been caught a hundred years later with the gold necklaces that Alexander the Great had put on them already covered up by the hide in great folds of fat. This animal is not liable to feverish diseasesindeed it even supplies a prophylactic against their attack; we know that recently certain ladies of the imperial house have made a practice of eating venison every day in the morning and have been free from fevers throughout a long lifetime; though it is thought that this only holds good if the stag has been killed by a single wound.

The animal called the goat-stag, occurring only near the river Phasis, is of the same appearance, differing only in having a beard, and a fleece on the shoulders.

51. Africa almost alone does not produce stags, but Africa also has the chameleon, although India produces it in greater numbers. Its shape and size were those of a lizard, were not the legs straight and longer. The flanks are joined on to the belly as in fishes, and the spine projects in a similar manner. It has a snout not unlike a pig's, considering its small size, a very long tail that tapers towards the end and curls in coils like a viper,

and crooked talons; it moves rather slowly like a tortoise and has a rough body like a crocodile's, and eyes in a hollow recess, close together and very large and of the same colours as its body. It never shuts its eyes, and looks round not by moving the pupil but by turning the whole eye. It holds itself erect with its mouth always wide open, and it is the only animal that does not live on food or drink or anything else but the nutriment that it derives from the air, with a gape that is almost terrifying, but otherwise it is harmless. And it is more remarkable for the nature of its colouring, since it constantly changes the hue of its eyes and tail and whole body and always makes it the colour with which it is in closest contact, except red and white. When dead it is of a pallid colour.

It has flesh on the head and jaws and at the junction tail in a rather scanty amount, and nowhere else in the whole body; blood in the heart and around the eyes only; its vital parts contain no spleen. It hibernates like a lizard in the winter months.

52. The reindeer of Scythia also changes its colours, but none other of the fur-clad animals does so except the Indian wolf, which is reported to have a mane on the neck. For the jackalwhich is a kind of wolf, longer in the body and differing in the shortness of the legs, quick in its spring, living by hunting, harmless to manchanges its raiment though not its colour, being shaggy through the winter but naked in summer. The reindeer is the size of an ox; its head is larger than that of a stag but not unlike it; it has branching horns, cloven hooves, and a fleece as shaggy as a bear's but, when it happens to be self-coloured, resembling an ass's coat. The hide is so hard that they use it for making cuirasses. When alarmed it imitates the colours of all the trees, bushes and flowers and places where it lurks, and consequently is rarely caught. It would be surprising that its body has such variety of character, but it is more surprising that even its fleece has.

53. The porcupine is a native of India and Africa. It is covered with a prickly skin of the hedgehogs' kind, but the spines of the porcupine are longer and they dart out when it draws the skin tight: it pierces the mouths of hounds when they close with it, and shoots out at them when further off. In the winter months it hibernates, as is the nature of many animals and before all of bears.

54. Bears couple at the beginning of winter, and not in the usual manner of quadrupeds but both lying down and hugging each other; afterwards they retire apart into caves, in which they give birth on the thirtieth day to a litter of five cubs at most. These are a white and shapeless lump of flesh, little larger than mice, without eyes or hair and only the claws projecting. This lump the mother bears slowly lick into shape. Nor is anything more unusual than to see a she-bear giving birth to cubs. Consequently the males lie in hiding for periods of forty days, and the females four months. If they have not got caves, they build rainproof dens by heaping up branches and brushwood, with a carpet of soft foliage on the floor. For the first fortnight they sleep so soundly that they cannot be aroused even by wounds; at this period they get fat with sloth to a remarkable degree (the bear's grease is useful for medicines and a prophylactic against baldness). As a result of these days of sleep they shrink in bulk and they live by sucking their fore paws. They cherish their freezing offspring by pressing them to their breast, lying on them just like birds hatching eggs. Strange to say, Theophrastus believes that even boiled bear's flesh, if kept, goes on growing in size for that period; that no evidence of food and only the smallest amount of water is found in the belly at this stage, and that there are only a few drops of blood in the neighbourhood of the heart and none in the rest of the body. In the spring they come out, but the males are very fat, a fact the cause of which is not evident, as they have not been fattened up even by sleep, except for a fortnight as we have said. On coming out they devour a plant called wake-robin to loosen the bowels, which are otherwise constipated, and they rub their teeth on treestumps to get their mouths into training. Their eyes have got dim, which is the chief reason why they seek for hives, so that their face may be stung by the bees to relieve that trouble with blood. A bear's weakest part is the head, which is the lion's strongest; consequently if when hard pressed by an attack they are going to fling themselves down from a rock they make the jump with their head covered with their fore paws, and in the arena are often killed by their head being broken by a buffet. The Spanish provinces believe that a bear's brain contains poison, and when bears are killed in shows their heads are burnt in the presence of a witness, on the ground that to drink the poison drives a man bear-mad. Bears even walk on two feet, and they crawl down trees backward. They tire out bulls with their weight by hanging by all four feet from their mouth and horns; and no other animal's stupidity is more cunning in doing harm. It is noted in the Annals that on 19 September in the consulship of Marcus Piso and Marcus Messala. Domitius Ahenobarbus as curule aedile provided in the circus a hundred Numidian bears and the same number of Ethiopian huntsmen. I am surprised at the description of the bears as Numidian, since it is known that the bear does not occur in Africa.

55. The mice of the Black Sea region also hibernate at all events the white ones, which are stated to have a very discriminating palate, though I am curious to know how the authorities detected this. Alpine mice, [marmots] which are the size of badgers, also hibernate, but these carry a supply of fodder into their caves beforehand. Some people say that they let themselves down into their cave in a string, male and female alternately holding the next one's tail in their teeth, and lying on their backs, embracing a bundle of grass that they have bitten off at the roots, and that consequently at this season their backs show marks of rubbing. There are also mice resembling these in Egypt, and they sit back on their haunches in a similar way, and walk on two feet and use their forepaws as hands.

56. Hedgehogs also prepare food for winter, and fixing fallen apples on their spines by rolling on them and holding one more in their mouth carry them to hollow trees. The same animals foretell a change of wind from North to South by retiring to their lair. But when they perceive someone hunting them they draw together their mouth and feet and all their lower part, which has thin and harmless down on it, and roll up into the shape of a ball, so that it may not be possible to take hold of any part of them except the prickles. But when desperate they make water over themselves, which corrodes their hide and damages their spines, for the sake of which they know that people catch them. Hence the scientific way is to hunt them just after they have discharged their water. And then the hide is of particular value, whereas otherwise it is spoiled and fragile, with the spines rotting and falling out, even if the animal escapes by flight and lives. On this account it does not drench itself with this damaging stuff except as a last resort, since even the creatures themselves hate this selfpoisoning, sparing themselves and waiting for the final limit so long that usually capture overtakes them beforehand. Afterwards the ball into which they roll up can be made to unroll by a sprinkle of hot water, and to fasten them up by one of the hind feet kills them through starvation when hanging: it is not possible to kill them in any other way and avoid damaging the hide. The animal itself is not, as most of us think, superfluous for the life of mankind, since, if it had not spines, the softness of the hides in cattle would have been bestowed on mortals to no purpose; hedgehog skirt is used in dressing cloth for garments. Even here fraud has discovered a great source of profit by monopoly, nothing having been the subject of more frequent legislation by the senate, and every emperor without exception having been approached by complaints from the provinces.

57. The urine of two other animals also has remarkable properties. We are told that there is a small animal called 'lion's-bane' that only occurs in regions where the lion is found, to taste of which causes that mighty creature, the lord of all the other four-footed animals, to expire immediately. Consequently men burn this creature's body and sprinkle it like pearl barley on the flesh of other animals as a bait for a lion, and even kill their prey with its ashes: so noisome a bane it is. Therefore the lion naturally hates it, and when he sees it crushes it and does all he can short of biting it to kill it; while it meets the attack by spraying urine, knowing already that this also is deadly to a lion.

The water of lynxes, voided in this way when they are born, solidifies or dries up into drops likecarbuncles and of a brilliant flame-colour, called lynx-waterwhich is the origin of the common story that this is the way in which amber is formed. The lynxes have learnt this and know it, and they jealously cover up their urine with earth, thereby causing it to solidify more quickly.

Another case of ingenuity in alarm, is that of the badgers: they ward off men's blows and the bites of dogs by inflating and distending their skin.

58. Squirrels also foresee a storm, and stop up their holes to windward in advance, opening doorways on the other side; moreover their own exceptionally bushy tail serves them as a covering. Consequently some have a store of food ready for the winter and others use sleep as a substitute for food.

59. It is said that the viper is the only snake that hides in the ground, all the others using holes in trees or rocks. And for the rest they can last out a year's starvation if only they are protected against cold. All kinds sleep at the period of retirement and are not poisonous. Snails also hibernate in the same way, these indeed retiring again in the summers also, mostly clinging to rocks, or even when violently bent back and torn away, nevertheless not going out. But those in the Balearic Islands called cave-snails do not crawl out of their holes in the ground and do not live on grass, but cling together in a cluster like a bunch of grapes. There is also another kind, which is not so common, that shuts itself in with a tightly fitting lid formed of the same material as its shell. These are always buried in the earth, and formerly were only dug up in the neighbourhood of the Maritime Alps, but they have now begun to be pulled up in the Velitrae district also; however the most highly commended kind of all is on the island of Astypalaea.

60. The greatest enemy of the snail is the lizard; this genus is said not to live more than six months. The lizard of Arabia

is 18 inches long, but those on Mount Nysus in India reach a length of 24 feet, and are coloured yellow or scarlet or blue.

61. Many also of the domestic animals are worth studying. and before all the one most faithful to man, the dog, and the horse. We are told of a dog that fought against brigands in defence of his master and although covered with wounds would not leave his corpse, driving away birds and beasts of prey; and of another dog in Epirus which recognized his master's murderer in a gathering and by snapping and barking made him confess the crime. The King of the Garamantes' was escorted back from exile by 200 dogs who did battle with those that offered resistance. The people of Colophon and also those of Castabulum had troops of dogs for their wars; these fought fiercely in the front rank, never refusing battle, and were their most loval supporters, never requiring pay. When some Cimbrians were killed their hounds defended their houses placed on waggons. When Jason of Lycia had been murdered his dog refused to take food and starved to death. But a dog the name of which Duris gives as Hyrcanus when king Lysimachus's pyre was set alight threw itself into the flame, and similarly at the funeral of King Hiero. Philistus also records the tyrant Gelo's dog Pyrrhus: also the dog of Nicomedes king of Bithynia is recorded to have bitten the King's wife Consingis because she played a rather loose joke with her husband. Among ourselves the famous Vulcatius, Cassellius's tutor in civil law, when returning on his cob from his place near Rome after nightfall was defended by his dog from a highwayman; and so was the senator Caelius, an invalid, when set upon by armed men at Piacenza, and he did not receive a wound till the dog had been despatched. But above all cases, in our own generation it is attested by the National Records that in the consulship of Appius Julius and Publius Silius when as a result of the case of Germanicus's son Nero punishment was visited on Titius Sabinus and his slaves, a dog belonging to one of them could not be driven away from him in prison and when he had been flung out on the Steps of Lamentation would not leave his body, uttering sorrowful howls to the vast concourse of the Roman public around, and when one of them threw it food it carried it to the mouth of its dead master; also when his corpse had been thrown into the Tiber it swam to it and tried to keep it afloat, a great crowd streaming out to view the animal's loyalty.

Dogs alone know their master, and also recognize a sudden arrival as a stranger; they alone recognize their own names, and the voice of a member of the household; they remember the way to places however distant, and no creature save man has a longer memory. Their onset and rage can be mollified by a person sitting down on the ground. Experience daily discovers very many other qualities in these animals, but it is in hunting that their skill and sagacity is most outstanding. A hound traces and follows footprints, dragging by its leash the tracker that accompanies it towards his quarry; and on sighting it how silent and secret but how significant an indication is given first by the tail and then by the muzzle Consequently even when they are exhausted with old age and blind and weak, men wry them in their arms sniffing at the breezes scents and pointing their muzzles towards Indians want hounds to be sired by tigers, the breeding season they tie up bitches in the for this purpose. They think that the first second litters are too fierce and they only rear the third one. Similarly the Gauls breed hounds wolves: each of their packs has one of the as leader and guide; the pack accompanies this leader in the hunt and pays it obedience; for dogs actually exercise authority among themselves. It is known that the dogs by the Nile lap up water from the river as they run, so as not to give the greed of the crocodiles its chance. When Alexander the Great was on his way to India, the king of Albania had presented him with one dog of unusually large size; Alexander was delighted by its appearance, and gave orders for bears and then boars and finally hinds to be let slipthe hound lying contemptuously motionless. This slackness on the part of so vast an animal annoyed the generous spirit of the Emperor, who ordered it to be destroyed. Report carried news of this to the king; and accordingly sending a second hound he added a message that Alexander should not desire to test it on small game but on a lion or an elephant; he had only possessed two of the breed and if this one was destroyed there would be none left. Alexander did not put off the trial, and forthwith saw a lion crushed. Afterwards he ordered an elephant to be brought in, and no other show ever gave him more delight: for the dog's hair bristled all over his body and it first gave a vast thunderous bark, then kept leaping up and rearing against the creature's limbs on this side and that, in scientific combat, attacking and retiring at the most necessary points, until the elephant turning round and round in an unceasing whirl was brought to the ground with an earth-shaking crash.

62. The genus dog breeds twice a year. Maturity for reproduction begins at the age of one. They carry their young for sixty days. Puppies are born blind, and acquire sight the more slowly the more copious the milk with which they are suckled; though the blind period never lasts more than three weeks or less than one. Some people report that a puppy born

singly sees on the 9th day, twins on the 10th, and so on, a corresponding number of days' delay in seeing light being added for each extra puppy; and that a bitch of a first litter begins to see sooner. The best in a litter is the one that begins to see last, or else the one that the mother carries into the kennel first after delivery.

63. Rabies in dogs, as we have said, is dangerous to human beings in periods when the dog-star is shining, as it causes fatal hydrophobia to those bitten in those circumstances. Consequently a precautionary measure during the 30 days in question is to mix dungmostly chicken's droppings, in the dog's food, or, if the disease has come already, hellebore. But after a bite the only cure is one which was lately discovered from an oracle, the root of the wild-rose called in Greek dogrose. Columella states that if a dog's tail is docked by being bitten off and the end joint amputated 40 days after birth, the spinal marrow having been removed the tail does not grow again and the dog is not liable to rabies. The only cases that have come down to us among portents, so far as I have noted of a dog talking and a snake barking when Tarqum was driven from his kingdom.

64. Alexander also had the good fortune to a great rarity in horseflesh. They called the animal Bucephalus, either because of its fierce appearance or from the mark of a bull's head branded on its shoulder. It is said that it was bought for sixteen talents from the herd of Philonicus of Pharsalus while Alexander was still a boy, as he was taken to its beauty. This horse when adorned with the royal saddle would not allow itself to be mounted by anybody except Alexander, though on other occasions it allowed anybody to mount. It is also celebrated for a memorable feat in battle, not having allowed Alexander during the attack on Thebes to change to another mount when it had been wounded; and a number of occurrences of the same kind are also reported, on account of which when it died the king headed its funeral procession, and built a city round its tomb which he named after it! Also the horse that belonged to Caesar the Dictator is said to have refused to let anyone else mount it; and it is also recorded that its fore feet were like those of a man, as it is represented in the statue that stands in front of the Temple of Venus Genetrix. The late lamented Augustus also made a funeral mound for a horse, which is the subject of a poem by Germanicus Caesar. At Girgenti a great number of horses' tombs have pyramids over them. Juba attests that Semiramis fell so deeply in love with a horse that she married it. The Scythian cavalry regiments indeed resound with famous stories of horses: a chieftain was challenged to a duel by an enemy and killed, and when his adversary came to strip his body of its armour, his horse kicked him and bit him till he died; another horse, when its blinkers were removed and it found out that a mare it had covered was its dam, made for a precipice and committed suicide. We read that an ostler in the Reate district was savaged by a horse for the same reason. For horses actually understand the ties of relationship, and a filly in a herd is even fonder of going with a sister a year older than with their dam. Their docility is so great that we learn that the entire cavalry of the army of Sybaris used to perform a sort of ballet to the music of a band. The Sybarite horses also know beforehand when there is going to be a battle, and when they lose their masters mourn for them: sometimes they shed tears at the bereavement. When King Nicomedes was killed his horse ended its life by refusing food. Phylarchus records that when Antiochus fell in battle one of the Galatians Centaretus caught his horse and mounted it in triumph, but it was fired with indignation and taking the bit between its teeth so as to become unmanageable, galloped headlong to a precipice where it perished with its rider. Philistus records that Dionysius left his horse stuck in a bog, and when it extricated itself it followed its master's tracks with a swarm of bees clinging to its mane; and that in consequence of this portent Dionysius seized the tyranny.

65. The cleverness of horses is beyond description. Mounted javelinmen experience their docility in assisting difficult attempts with the actual swaying of their body; also they gather up the weapons lying on the ground and pass them to their rider. Horses harnessed to chariots in the circus unquestionably show that they understand the shouts of encouragement and applause. At the races in the circus forming part of the Secular Games of Claudius Caesar a charioteer of the Whites named Raven was thrown at the start, and his team took the lead and kept it by getting in the way of their rivals and jostling them aside and doing everything against them that they would have had to do with a most skilful charioteer in control, and as they were ashamed for human science to be beaten by horses, when they had completed the proper course they stopped dead at the chalk line. A greater portent was when in early days a charioteer was thrown at the plebeian circus races and the horses galloped on to the Capitol and raced round the temple three times just the same as if he still stood at the reins; but the greatest was when a chariot-team reached the same place from Veii with the palm-branch and wreath after Ratumenna who had won at Veii had been thrown: an event which subsequently gave its name to the gate. The Sarmatians get

their horses into training for a long journey by giving them no fodder the day before and only allowing them a small amount of water, and by these means they ride them on a journey of 150 miles without drawing rein.

Some horses live fifty years, but mares live a shorter time; mares stop growing when five years old, the males a year later. The appearance of the horse that ought to be most preferred has been very beautifully described in the poetry of Virgil, but we also have dealt with it in our book on the Use of the Javelin by Cavalry, and I observe that there is almost universal agreement about it. But a different build is required for the Circus; and consequently though horses may be broken as two-year-olds to other service, racing in the Circus does not claim them before five.

66. Gestation in this genus lasts eleven months and the foal is born in the twelfth month. Breeding takes place as a rule in the spring equinox when both animals are two-year-olds, but the progeny is stronger if breeding begins at three. A stallion goes on serving to the age of 33, as they are sent from the racecourse to the stud at 20. It is recorded that a stallion at Opus even continued to 40, only he needed assistance in lifting his fore-quarters. But few animals are such unfertile sires as the horse; consequently intervals are allowed in breeding, and nevertheless a stallion cannot stand serving fifteen times in the same year. Mares in heat are cooled down by having their manes shorn; they foal yearly up to 40. It is stated that a mare has lived to 75.

In the equine genus the pregnant female is delivered standing up; and she loves her offspring more than all other female animals. And in fact a love-poison called horse-frenzy is found in the forehead of horses at birth, the size of a dried fig, black in colour, which a brood mare as soon as she has dropped her foal eats up, or else she refuses to suckle the foal. If anybody takes it before she gets it, and keeps it, the scent drives him into madness of the kind specified. If a foal loses its dam the other brood mares in the same herd rear the orphan. It is said that a foal is unable to reach the pound with its mouth within the first three days after birth. The greedier it is in drinking the deeper it dips its nostrils into the water. The Scythians prefer mares as chargers, because they can make water without checking their gallop.

67. It is known that in Lusitania in the neighbourhood of the town of Lisbon and the river Tagus mares when a west wind is blowing stand facing towards it and conceive the breath of life and that this produces a foal, and this is the way to breed a very swift colt, but it does not live more than three years. Also in Spain the Gallaic and Asturian tribes breed those of the horse kind that we call 'theldones,' though when more of a pony type they are designated 'cobs', which have not the usual paces in running but a smooth trot, straightening the near and offside legs alternately, from which the horses are taught by training to adopt an ambling pace.

The horse has nearly the same diseases as mankind, and is also liable to shifting of the bladder, as are all beasts of the draft class.

68. Marcus Varro states that an ass was Ass-bought for the senator Quintus Axius at 400,000 sesterees which perhaps beats the price paid for any other animal. The services of the ass kind are undoubtedly bountiful in ploughing as well, but especially in breeding mules. In mules also regard is paid to locality of originin Greece the Arcadian breed is esteemed and in Italy the Iteatine. The ass itself is very had at enduring cold. and consequently is not bred in the Black Sea district; and it is not allowed to breed at the spring equinox like all other cattle, but at midsummer. The males make worse sires when not in work. The females breed at two and a half years old at earliest, but regularly from three; they can breed as many times as mares, and in the same months and in a similar way. But the womb cannot retain the genital fluid but discharges it, unless the animal is whipped into a gallop after coupling. It seldom bears twins. When about to bear a foal it shuns the sunlight and seeks the shadow, so as not to be seen by a human being. It breeds through all its lifetime, which is thirty years. It has a very great affection for its young, but a greater dislike for water: she-asses will go through fire to their foals, but yet if the smallest stream intervenes they are afraid of merely wetting their hooves. Those kept in pastures will only drink at springs they are used to, and where they can get to drink by a dry track; and they will not go across bridges with interstices in their structure allowing the gleam of the river to be seen through them; and, surprising to say, they may be thirsty and have to be forced or coaxed to drink, if the stream is not the one they are used to. Only a wide allowance of stallroom is safe for them to lie down in, for when asleep they have a variety of dreams and frequently let out with their hooves, which at once causes lameness by hitting timber that is too hard unless they have plenty of room to kick in. The profit made out of she-asses surpasses the richest spoils of war. It is known that in Celtiberia their foals have made 400 000 sesterces per dam, especially when mules are bred. They say that in she-asses the hair of the ears and the eyelids is an important point, for although the rest of the dam's body is all one colour, the foal reproduces all the colours that were in those places. Maecenas set the fashion of eating donkey foals

at banquets, and they were much preferred to wild asses at that period; but after his time the ass lost favour as a delicacy. Animals of this genus very quickly flag when their sight beeins to go.

69. A mare coupled with an ass after twelve-months bears a mule, an animal of exceptional strength for agricultural operations. To breed mules they choose mares not less than four or more than ten years old. Also breeders say that females of either genus refuse stallions of the other one unless as foals they were suckled by females of the same genus as the stallions; for this reason they stealthily remove the foals in the dark and put them to mares' or she-asses' udders respectively. But a mule is also got by a horse out of an ass, though it is unmanageable, slow and obstinate. Also all the foals from old mares are sluggish. It causes miscarriage for a mare in foal by a horse to be put to an ass, but not vice versa. It has been observed that female asses are best coupled six days after they have borne a foal, and that males couple better when tired. It is noticed that a female that does not conceive before she casts what are called her milk-teeth is barren, as is one that does not begin to produce foals from the first coupling. Male foals of an ass by a horse were in old days called hinnies, while the term mules was used for the foals of a mare by an ass. It has been noticed that the offspring of two different races of animals belong to a third kind and resemble neither parent; and that such hybrids are not themselves fertile: this is the case with all kinds of animals, and is the reason why mules are barren. A number of cases of reproduction by mules are recorded in our Annals, but these were considered portentous. Theophrastus states that mules breed commonly in Cappadocia, but that the Cappadocian mule is a peculiar species. A mule can be checked from kicking by rather frequent drinks of wine. It is stated in the records of a good many Greeks that a foal has been got from a mare coupled with a mule, called a ginnus, which means a small mule. Shemules bred from a mare and tamed wild-asses are swift in pace and have extremely hard hooves, but a lean body and an indomitable spirit. But as a sire the foal of a wild-ass and a domestic she-ass excels all others. The wild-asses in Phrygia and Lycaonia are pre-eminent. Africa boasts of their foals as an outstanding table delicacy; the vernacular word for them is lalisio. Records at Athens attest a mule's having lived 80 years: for the citizens were so delighted because after it had been put aside owing to old age it encouraged the teams by its company and assistance in their uphill work during the construction of a temple on the citadel, that they made a decree that the corndealers were not to keep it away from their stands.

70. Indian oxen are reported to be as tall as camels and to have horns with a span of four feet. In our part of the world the most famous are those of Epirus, having been so, it is said, ever since the attention given to them by King Pyrrhns. Pyrrhus achieved this result by not requisitioning them for breeding before the age of four; consequently his oxen were very large, and the remains of his breeds continue even today. But now yearling heifers are called upon for breeding, though they can stand it better at two years, while bulls are made to serve at four. Each bull serves ten cows in the same year. It is said that if the bulb after coupling go away towards the right hand side the offspring will be males, and if towards the left, females. Conception is effected by one coupling, and if this happens to miss, the female goes to a male again twenty days after. They bear the calf in the tenth month; one produced before is of no use. Some authorities say that they bear on the actual last day of the tenth month. They rarely produce twins. Coupling takes place in the thirty days following the rise of the Dolphin on January 4, and occasionally in the autumn also, though nations that live on milk spread it out so that there may be a supply of this nutriment at every season of the year. Bulls do not couple more than twice in one day. Oxen are the only animals that graze even while walking backward; indeed among the Garamantes that is their only way of grazing. The longest life of a cow is 15 years and of a bull 20; they grow to full strength at 5. Washing in hot water is said to fatten them, and also cutting a hole in the hide and blowing air into the flesh with a reed. Even the breeds less praised for their appearance are not to be deemed inferior: the Alpine cows which are the smallest in size give most milk, and do most work, although they are yoked by the head and not the neck. Syrian oxen have no dewlaps, but a hump on the back. Also the Carian breed in a district of Asia is said to be ugly in appearance, with a swelling that projects from the neck over the shoulders and with the horns displaced, but excellent in workalthough when black and white in colour they are said to be no good for ploughing; the bulls have smaller and thinner horns than the cows. Oxen should be broken when three years old; after that it is too late and before too early; the best way to train a young bullock is to yoke it with one already broken in. For we possess in this animal a partner in labour and in husbandry, held in such esteem with our predecessors that among our records of punishments there is a case of a man who was indicted for having killed an ox because a wanton young companion said he had never eaten bullock's tripe, and was convicted by the

public court and sent into exile just as though he had murdered his farm-labourer.

Bulls have a noble appearance, a grim brow, bristly ears, and horns bared for action and asking for a fight; but their chief threat is in their fore feet: a bull stands glowing with wrath, bending back either fore foot in turn and splashing up the sand against his bellyit is the only animal that goads itself into a passion by these means. We have seen bulls, when fighting a duel under orders and on show for the purpose, being whirled round and caught on the horns as they fall and afterwards rise again, and then when lying down be lifted off the ground, and even stand in a car like charioteers with a pair of horses racing at full speed. It is a device of the Thessalian race to kill bulls by galloping a horse beside them and twisting back the neck by the horn: the dictator Caesar first gave this show at Rome. The bull supplies costly victims and the most sumptuous appeasement of the gods. In this animal only of all that have a comparatively long tail, the tail is not of the proper size from birth, as it is in the others; and with it alone the tail grows till it reaches right down to the feet. Consequently the test of victims for sacrifice in the case of a calf is that the tail must reach the joint of the hock: if it is shorter the offering is not acceptable. It has also been noted that calves are not usually acceptable if carried to the altars on a man's shoulders, and also that the gods are not propitiated if the victim is lame or is not of the appropriate sort, or if it drags itself away from the altar. It frequently occurs among the prodigies of old times that an ox spoke, and when this was reported it was customary for a meeting of the senate to be held in the open air.

71. In Egypt an ox is even worshipped in place of a god; its name is Apis. Its distinguishing mark is a bright white spot in the shape of a crescent on the right flank, and it has a knob under the tongue which they call a beetle. It is not lawful for it to exceed a certain number of years of life, and they kill it by drowning it in the fountain of the priests, proceeding with lamentation to look for another to put in its place, and they go on mourning till they have found one, actually shaving the hair off their heads. Nevertheless the search never continues long. When the successor is found it is led by 100 priests to Memphis. It has a pair of shrines, which they call its bedchambers, that supply the nations with auguries; when it enters one this is a joyful sign, but in the other one it portends terrible events. It gives answers to private individuals by taking food out of the hand of those who consult it; it turned away from the hand of Germanicus Caesar, who was made away with not long after. Usually living in retirement, when it sallies forth into assemblies it proceeds with lictors to clear the way, and companies of boys escort it singing a song in its honour; it seems to understand, and to desire to be worshipped. These companies are suddenly seized with frenzy and chant prophecies of future events. Once a year a cow is displayed to it, she too with her decorations, although they are not the same as his: and it is traditional for her always to be found and put to death on the same day. At Memphis there is a place in the Nile which from its shape they call the Goblet; every year they throw into the river there a gold and a silver cup on the days which they keep as the birthdays of Apis. These are seven; and it is a remarkable fact that during these days nobody is attacked by crocodiles, but that after midday on the eighth day the creature's savagery returns.

72. Sheep are also of great service either in respect of propitiatory offerings to the gods or in the use of their fleeces. As oxen improve men's diet, so the protection of their bodies is owed to sheep. They breed when two years old on both sides, till the age of nine, and in some cases even till ten. The lambs at the first birth are smaller. They all couple from the setting of Arcturus, that is May 13th, to the setting of Aquila, July 23rd; they carry their lambs 150 days. Lambs conceived after the date mentioned are weak; in old days those born later were called cordi. Many people prefer winter lambs to spring ones, holding that it is more important for them to be wellestablished before midsummer than before midwinter, and that this animal alone is advantageously born in winter. It is inbred in the ram to despise lambs as mates and to desire maturity in sheep; and the ram himself is better in old age, and also more serviceable when polled. His wildness is restrained by boring a hole in the horn close to the ear. If a ligature is put on the right testicle he gets females and if on the left males. Claps of thunder cause sheep to miscarry when solitary; the remedy is to herd them in flocks, so as to be cheered by company. They say that male lambs are got when a north wind is blowing and female when a south; and in this breed the greatest attention is given to the mouths of the rams, as the wool in the case of the progeny is of the colour of the veins under the tongue of the parent ram, and if these were of several colours the lamb is van-coloured. Also changing the water they drink varies their colour.

There are two principal breeds of sheep, jacketed sheep and farm sheep; the former are softer and the latter more delicate in their pasture, inasmuch as the jacketed sheep feeds on brambles. The best jackets for them are made of Arabian sheep's wool.

73. The most highly esteemed wool is the Apulian and the kind that is called in Italy wool of the Greek breed and elsewhere Italian wool. The third place is held by the sheep of Miletus. The Apulian fleeces are short in the hair, and not of great repute except for cloaks; they have a very high reputation in the districts of Taranto and Canossa, as have the Laodicean fleeces of the same breed in Asia. No white fleece is valued above that from the district of the Po, and none has hitherto gone beyond the price of a pound. Sheep are not shorn everywherein some places the practice survives of plucking off the wool. There are several sorts of colour, in fact even names are lacking for the wools which are variously designated after their places of origin: Spain has the principal black wool fleeces, Pollentia near the Alps white, Asia the red fleeces that they call Erythrean. Baetica the same, Canossa tawny, Taranto also a dark colour of its own.. All fresh fleeces have a medicinal property. Istrian and Liburnian fleece is nearer to hair than wool, and not suitable for garments with a soft nap; and the same applies to the fleece that Salaeia in Lusitania advertises by its check pattern. There is a similar wool in the district of the Fishponds in the province of Narbonne, and also in Egypt, which is used for darning clothes worn by use and making them last again for a long period. Also the coarse hair of a shaggy fleece has a very ancient popularity in carpets: Homer a is evidence that they were undoubtedly in use even in very early times. Different methods of dyeing these fleeces are practised by the Gauls and by the Parthian races. Self-felted fleeces make clothing, and also if vinegar is added withstand even steel, nay more even fire, the latest method of cleaning them. In fact fleeces drawn from the coppers of the polishers serve as stuffing for cushions, I believe by a French invention: at all events at the present day it is classified under Gallic names. And I could not easily say at what period this began; for people in old times had bedding of straw, in the same way as in camp now. Frieze cloaks began within my father's memory and cloaks with hair on both sides within my own, as also shaggy body-belts; moreover weaving a broad-striped tunic after the manner of a frieze cloak is coming in for the first time now. Black fleeces will not take dye of any colour; we will discuss the dyeing of the other sorts in their proper places under the head of marine shellfish or the nature of various plants.

74. Marcus Varro informs us, on his own authority, that the wool on the distaff and spindle of Tanaquil (who was also called Gala Caecilia) was still preserved in the temple of Sancus; and also in the shrine of Fortune a pleated royal robe made by her, which had been worn by Servius Tullius. Hence arose the practice that maidens at their marriage were accompanied by a decorated distaff and a spindle with thread. Tanaquil first wove a straight tunic of the kind that novices wear with the plain white toga, and newly married brides. The pleated robe was the first among those most in favour; consequently the spotted robe went out of fashion. Fenestella writes that togas of smooth cloth and of Phrygian wool began in the latest times of the late lamented Augustus. Togas of closely woven poppy-cloth have a an older source, being noticed as far back as the poet Lucilius in the case of Torquatus. Bordered robes found their origin with the Etruscans. I find it recorded that striped robes were worn by the kings, and they had embroidered robes as far back as Homer, these being the origin of those worn in triumphs. Embroidering with the needle was discovered by the Phrygians, and consequently embroidered robes are called Phrygian. Gold embroidery was also invented in Asia, by King Attalus, from whom Attalic robes got their name. Weaving different colours into a pattern was chiefly brought into vogue by Babylon, which gave its name to this process. But the fabric called damask woven with a number of threads was introduced by Alexandria, and check patterns by Gaul. Metellus Scipio counts it among the charges against Capito that Babylonian coverlets were already then sold for 800,000 sesterces, which lately cost the Emperor Nero 4,000,000. The state robes of Servius Tullius, with which the statue of Fortune dedicated by him was draped, lasted till the death of Sejanus, and it was remarkable that they had not rotted away or suffered damage from moths in 560 years. We have before now seen the fleeces even of living animals dyed with purple, scarlet, crimson ... [with eighteen inch scales/pounds] as though luxury forced them to be born like that.

75. In the sheep itself breed is sufficiently shown by shortness of the legs and a well-clothed belly. Sheep with the belly bare used to be called 'misfits' and turned down. The sheep of Syria have tails 18 inches long, and a great deal of wool on that part. It is considered too soon for lambs to be gelt unless five months old.

In Spain, but particularly in Corsica, there is an animal not unlike the sheep, the moufflon, with hair nearer the goat's than the sheep's; these when crossed with sheep produce what in old days were called Umbrians. Sheep are very weak in the head, and consequently must be made to graze with their backs to the sun. The fleecy sheep is the stupidest of animals; if afraid to go into a place they will follow one of the flock that is taken by the horn. Their longest term of life is 10 years, in other Ethiopia 13; goats in Ethiopia live 11 years, but in other parts of the world at most eight. In breeding with either kind to couple three times at most is sufficient.

76. Goats bear as many as four kids at once, but rather seldom; they carry their young for 5 months, like sheep. Hegoats are made sterile by over-fattening. They are not very useful as sires till three years old, nor in old age, and they do not serve for more than four years. They begin when six months old and before they are weaned. Both sexes breed better with the horns removed. The first coupling in the day has no result, but the following and subsequent ones are more effectual. She-goats conceive in November so as to bear kids in March when the bushes arc buddingyearlings sometimes and two-year-olds always, but they are not of much use for breeding unless three years old. They go on bearing for eight years. They are liable to miscarriage from cold. A she-goat cures its eyes when bloodshot by pricking them on a rush, hegoats on a bramble. Mucianus has described a case of this animal's cleverness seen by himselftwo goats coming in opposite directions met on a very narrow bridge, and as the narrow space did not permit them to turn round and the length did not allow of backing blindly on the scanty passageway with a rushing torrent flowing threateningly below, one of them lay down and so the other one passed over, treading on top of it. People admire he-goats that are as snub nosed as possible, with long drooping ears and extremely shaggy flanks. It is a mark of good breeding in she-goats to have two dewlaps hanging down from the neck; not all have horns, but in those that have there are also indications of their years furnished by the growths of the knobs; they give more milk when without horns; according to Archelaus they breathe though the ears, not the nostrils, and are never free from fever: this is perhaps the reason why they are more highspirited than sheep and hotter in coupling. It is said that goats can see by night as well as they can in the daytime, and that consequently a diet of goat's liver restores twilight sight to persons suffering from what is called night-blindness. In Cilicia and the Syrtes region people wear clothes made of hair shorn from goats. They say that she-goats in the pastures when the sun is setting do not look at one another but lie down with their backs to each other, though at other times of the day they lie facing each other and take notice of one another. From the chin of all goats hangs a tuft of hair called their heard. If you grasp a she-goat by this and drag her out of the herd the others look on in amazement; this also happens as well when one of them nibbles a particular plant. Their bite kills a tree; they make an olive tree barren even by licking it, and for this reason they are not offered in sacrifice to Minerva.

77. Swine are allowed to breed from the beginning of spring to the vernal equinox, beginning at seven months old and in some places even at three months, and continuing to their eighth year. Sows bear twice a year, carrying their pigs four months: litters number up to 20, but sows cannot rear so many. Nigidius states that for ten days at midwinter pigs are born with the teeth already grown. Sows are impregnated by one coupling, which is also repeated because they are so liable to abortion; the remedy is not to allow coupling at the first heat or before the ears are pendulous. Hogs cannot serve when over three years old. Sows exhausted by age couple lying down; it is nothing out of the way for them to eat their litter. A pig is suitable for sacrifice four days after birth, a lamb in a week and a calf in a month. Coruncanius asserted that ruminant animals are not acceptable as victims before they grow their front teeth. It is thought that a sow that loses an eye soon dies, but that otherwise sows live to fifteen and in some cases even twenty years; but they become savage, and in any ease the breed is liable to diseases, especially quinsy and serofula. Symptoms of bad health in a sow are when blood is found on the root of a bristle pulled out of its back and when it holds its head on one side in walking. If too fat they experience lack of milk; and they have a smaller number of pigs in their first litter. The breed likes wallowing in mud. The tail is curly; also it has been noticed that it is easier to kill them for sacrifice when the tail curls to the right than when to the left. They take 60 days to fatten, but fatten better if feeding up is preceded by three days' fast. The pig is the most brutish of animals, and there used to be a not unattractive idea that its soul was given it to serve as salt. it is a known fact that some pigs carried off by thieves recognized the voice of their swineherd, crowded to one side of the ship till it capsized and sank, and swam back to shore. Moreover the leaders of a herd in the city learn to go to the market place and to find their way home: and wild hogs know how to obliterate their tracks by crossing marshy ground, and to relieve themselves when running away by making water. Sows are spayed in the same way as also camels are, by being hung up by the fore legs after two days without food and having the matrix cut out; this makes them fatten quicker. There is also a method of treating the liver of sows as of geese, a discovery of Marcus Apiciusthey are stuffed with dried fig, and when full killed directly after having been given a drink of mead. Nor does any animal supply a larger number of materials for an eatinghouse: they have almost fifty flavours, whereas all other meats have one each. Hence pages of sumptuary laws, and the prohibition of hog's paunches, sweetbreads, testicles, matrix and cheeks for banquets, although nevertheless no dinner of the pantomime writer Publius after he had obtained his freedom is recorded that did not include paunchhe actually got from this the nickname of Pig's Paunch.

78. But also wild boar has been a popular meat. luxury. As far back as Cato the Censor a we find his speeches denouncing boar's meat bacon. Nevertheless a boar used to be cut up into three parts and the middle part served at table, under the name of boar's loin. Publius Servilius Rullus, father of the Rullus who brought in the land settlement act during Cicero's consulship, first served a boar whole at his banquetsso recent is the origin of what is now an everyday affair; and this occurrence has been noted by historians, presumably for the improvement of the manners of the present day, when it is the fashion for two or three boars to be devoured at one time not even as a whole dinner but as the first course.

Fulvius Lippinus was the first person of Roman nationality who invented preserves for wild pigs and the other kinds of game: he introduced keeping wild animals in the district of Tarquinii; and he did not long lack imitators, Lucius Lucullus and Quintus Hortensius.

Wild pigs breed once a year. The boars are very rough when mating; at this period they fight each other, hardening their flanks by rubbing against trees and plastering their behinds with mud. The females are fiercer when with young, and this is more or less the same in every kind of wild animal. Male boats do not mate till one year old. In India they have curved tusks 18 in. long: two project from the jaw, and two from the forehead like a call's horns. The wild boar's hair is a sort of copper colour; that of the other species is black. But the hog genus does not occur in Arabia.

79. In the case of no other kind of animal is it so easy to cross with the wild variety; the offspring of such unions in old days were called 'hybrids,' meaning half-wild, a term also applied as a nickname to human beings, for instance, to Cicero's colleague in the consulship Gaius Antonius. But not only in pigs but in all animals as well whenever there is any tame variety of a genus there is also found a wild one of the same genus, inasmuch as even in the case of man an equal number of savage races have been predicted to exist. Nevertheless the formation of the goat is transferred to a very large number of similar species: there are the goat, the chamois and the ibexan animal of marvellous speed, although its head is burdened with enormous horns resembling the sheaths of swords, towards which it sways itself as though whirled with a sort of catapult, chiefly when on rocks and seeking to leap from one crag to another, and by means of the recoil leaps out more nimbly to the point to which it wants to get. There are also the oryx, the only species according to certain authorities clothed with hair lying the wrong way, towards the head, and the antelope, the white-rumped antelope, the twisted-horn antelope and a great many other not dissimilar species. But the former we receive from the Alps, the latter from places across the sea.

80. The kinds of apes also which are closest to the human shape are distinguished from each other by the tails. They are marvellously cunning: people say that they use bird-lime as ointment, and that they put on the nooses set to snare them as if they were shoes, in imitation of the hunters; according to Mucianus the tailed species have even been known to play at draughts, are able to distinguish at a glance sham nuts made of wax, and are depressed by the moon waning and worship the new moon with delight: and it is a fact that the other fourfooted animals also are frightened by eclipses. The genus ape has a remarkable affection for its young. Tame monkeys kept in the house who bear young ones carry them about and show them to everybody, and delight in having them stroked, looking as if they understood that they are being congratulated; and as a consequence in a considerable number of cases they kill their babies by hugging them. The baboon is of a fiercer nature, just as the satyrus is extremely gentle. The pretty-haired ape is almost entirely different in appearance: it has a bearded face and a tail flattened out wide at the base. This animal is said to be unable to live in any other climate but that of its native country, Ethiopia.

81. There are also several kinds of hare. In the Alps there are white hares, which are believed to eat snow for their fodder in the winter monthsat all events they turn a reddish colour every year when the snow meltsand in other ways the animal is a nurseling of the intolerable cold. The animals in Spain called rabbits also belong to the genus hare; their fertility is beyond counting, and they bring famine to the Balearic Islands by ravaging the crops. Their young cut out from the mother before birth or taken from the teat are considered a very great delicacy, served without being gutted; the name for them is laurer. It is an established fact that the peoples of the Balearics petitioned the late lamented Augustus for military assistance against the spread of these animals. The ferret is extremely popular for rabbit-hunting; they throw ferrets into the burrows with a number of exits that the rabbits tunnel in the ground (this is the derivation of their name cony) and so catch the rabbits when they are driven out to the surface. Archelaus states that a hare is as many years old as it has folds in the bowel: these are certainly found to vary in number. The same authority says that the hare is a hermaphrodite and reproduces equally well without a male. Nature has shown her benevolence in making harmless and edible breeds of animals prolific. The hare which is born to be all creatures' prey is the only animal beside the shaggy-footed rabbit that practises superfetation, rearing one leveret while at the same time carrying in the womb another clothed with hair and another bald and another still an embryo. Also the experiment has been made of using the fur of the hare for making clothes, although it is not so soft to the touch as it is when on the animal's skin, and the garments soon come to pieces because of the shortness of the hair.

82. Hares rarely grow tame, although they cannot properly be termed wild animalsfor in fact there are a good many creatures that are neither wild nor tame but of a character intermediate between each, for instance among winged things swallows and bees, in the sea dolphins. Many people have also placed in this class these denizens of our homes the mice, a creature not to be ignored among portents even in regard to public affairs; they foretold the war with the Marsians by gnawing the silver shields at Lanuvium, and the death of General Carbo by gnawing at the puttees that he wore inside his sandals. There are more varieties of mice in the district of Cyrene, some with broad and others with pointed heads, and others like hedgehogs with prickly bristles. Theophrastus states that on the island of Chiura when they had banished the inhabitants they even gnawed iron, and that they also do this by a sort of instinct in the iron foundries in the country of the Chalvbes: indeed, he says, in gold mines because of this their bellies get cut away and their theft of gold is always detected, so fond are they of thieving. The Public Records relate that during the siege of Casilinum by Hannibal a mouse was sold for 200 francs, and that the man who sold it died of hunger while the buyer lived. The appearance of white mice constitutes a joyful omen. For we have our Records full of instances of the auspices being interrupted by the squeaking of shrews. Nigidius states that shrews themselves also hibernate as do dormice, which sumptuary legislation and Marcus Scaurus the Head of the State during his consulship ruled out from banquets just as they did shell-fish or birds imported from other parts of the world. The shrewmouse itself also is a half-wild animal, and keeping it alive in jars was originated by the same person as started keeping wild pigs. In this connexion it has been noticed that shrew-mice do not associate unless they are natives of the same forest, and if foreigners separated by a river or mountain are introduced they die fighting one another. They feed their parents when exhausted by old age with remarkable affection. Their old age comes to its end during the winter reposefor these creatures also hibernate, and renew their youth at the coming of summer. Dormice hibernate similarly.

83. In this connexion it is surprising that Nature has not only assigned different animals to different countries, but has also denied certain animals to some places in the same region. In the Mesian forest in Italy dormice of which we are now speaking are only found in one part. In Lycia the gazelles do not cross the mountains near the Sexi, nor the wild asses the boundary dividing Cappadocia from Cilicia. The stags on the Hellespont do not migrate into unfamiliar districts, and those in the neighbourhood of Arginusa do not go beyond Mount Elaphus, even those on the mountain having cleft ears. In the island of Pordoselene weasels do not cross a road. Similarly in Boeotia moles that undermine the whole of the fields in Orchomenus near by, when imported into Lebadea are shy of the very soil. We have seen counterpanes for beds made out of their skins: so powerless is even superstition to protect the miraculous against luxury. In Ithaca imported hares die on the very edge of the shore, as do rabbits in Iviza, although Spain and the Balearic Islands close by are teeming with them. At Cyrene the frogs were silent, and though croaking frogs have been imported from the mainland the silent breed goes on. Frogs are also silent in the island of Seriphus, but the same frogs croak when removed to some other place, which is also said to happen in the Siccanean Lake in Thessaly. The bite of the shrewmouse in Italy is venomous, but the venomous species is not found in the district beyond the Apennines. Also wherever it occurs it dies if it crosses the track of a wheel. There are no wolves on Mount Olympus in Macedon, nor in the island of Crete. In fact in Crete there are no wolves or bears either, and no noxious animal at all except a poisonous spider: we shall speak of this species in its place, under the head of spiders. It is more remarkable that in the same island there are no stags except in the district of Cydonea, and the same is the case with wild boars and francolins and hedgehogs, while in Africa there are neither wild boars nor stags nor wild goats nor bears.

84. Again, some animals harmless to natives of the country are deadly to foreigners, for instance some small snakes at Tiryns that are said to be born from the earth. Similarly serpents in Syria specially found about the banks of the Euphrates do not touch Syrians when asleep, or even if they bite them when trodden on are not felt to cause any evil effect, but they are maleficent to other people of whatever race, killing them voraciously and with torturing pain, on account of which the Syrians also do not kill them. On the other hand Aristotle [FR. 605 Rose] relates that the scorpions on Mount Latmos in Carla do not wound strangers but kill natives. But we will also speak of the remaining kinds of land animals.

NATURAL HISTORY BOOK 9

 We have indicated the nature of the species that we have designated land animals, as living in some kind of association with men. Of the remaining kinds it is agreed that birds are the smallest. We will therefore first speak of the creatures of the seas, rivers and ponds.

There are however a considerable number of these that are larger even than land animals. The obvious cause of this is the lavish nature of liquid. Birds, which live hovering in the air. are in a different condition. But in the sea, lying so widely outspread and so yielding and productive of nutriment, because the element receives generative causes from above and is always producing offspring, a great many actual monstrosities are found, the seeds and first principles intertwining and interfolding with each other now in one way and now in another, now by the action of the wind and now by that of the waves, so ratifying the common opinion that everything born in any department of nature exists also in the sea, as well as a number of things never found elsewhere. Indeed we may realize that it contains likenesses of things and not of animals only, when we examine the grape, the swordfish. the saw-fish, and the cucumber-fish, the last resembling a real cucumber both in colour and scent: which makes it less surprising that in cockle-shells that are so tiny there are horses' heads projecting.

2. But the largest number of animals and those of the largest size are in the Indian sea, among them whales covering three acres each, and sharks 100 ells long: in fact in those regions lobsters grow to 6 ft. long, and also eels in the river Ganges to 300 ft. The monsters in the sea are mostly to be seen about the solstices. At those periods in that part of the world there are rushing whirlwinds and rainstorms and tempests hurtling down from the mountain ridges that upturn the seas from their bottom, and roll with their waves monsters forced up from the depths in such a multitude, like the shoals of tunnies in other places, that the fleet of Alexander the Great deployed its column in line of battle to encounter them, in the same way as if an enemy force were meeting it: it was not possible to escape them in any other manner. They are not scared by shouts or noises or uproar, but only by impact, and they are only routed by a violent collision. There is an enormous peninsula in the Red Sea called Cadara, the projection of which forms a vast bay which took King Ptolemy twelve days and nights of rowing to cross, as it does not admit a breath of wind from any quarter. In this tranquil retreat particularly the creatures grow to a huge motionless bulk. The admirals of the fleets of Alexander the Great have stated that the Gedrosi who live by the river Arabis make the doorways in their houses out of the monsters' jaws and use their bones for roof-beams, many of them having been found that were 60 ft. long. Also great creatures resembling sheep come out on to the land in that country and after grazing on the roots of bushes return; and there are some with the heads of horses, asses and bulls that eat up the crops.

3. The largest animals in the Indian Ocean are the shark and the whale; the largest in the Bay of Biscay is the sperm-whale, which rears up like a vast pillar higher than a ship's rigging and belches out a sort of deluge; the largest in the Gulf of Cadiz is the tree-polypus, which spreads out such vast branches that it is believed never to have entered the Straits of Gibraltar because of this. The creatures called Wheels from their resemblance to a wheel also put in an appearance, these radiating in four spokes, with their nave terminating in two eyes, one on each side.

4. An embassy from Lisbon sent for the purpose reported to the Emperor Tiberius that a Triton had been seen and heard playing on a shell in a certain cave, and that he had the wellknown shape. The description of the Nereids also is not incorrect, except that their body is bristling with hair even in the parts where they have human shape: for a Nereid has been seen on the same coast, whose mournful song moreover when dying has been heard a long way off by the coast-dwellers; also the Governor of Gaul wrote to the late lamented Augustus that a large number of dead Nereids were to be seen on the shore. I have distinguished members of the Order of Knighthood as authorities for the statement that a man of the sea has been seen by them in the Gulf of Cadiz, with complete resemblance to a human being in every part of his body, and that he climbs on board ships during the hours of the night and the side of the vessel that he sits on is at once weighed down, and if he stays there longer actually goes below the water. During the rule of Tiberius, in an island off the coast of the province of Lyons the receding ocean tide left more than 300 monsters at the same time, of marvellous variety and size, and an equal number on the coast of Saintes, and among the rest elephants, and rams with only a white streak to resemble horns, and also many Nereids. Turranius has stated that a monster was cast ashore on the coast at Cadiz that had 24 feet

of tail-end between its two fins, and also 120 teeth, the biggest 9 inches and the smallest 6 inches long. The skeleton of the monster to which Andromeda in the story was exposed was brought by Marcus Scaurus from the town of Jaffa in Judaea and shown at Rome among the rest of the marvels during his aedileship; it was 40 ft. long, the height of the ribs exceeding the elephants of India, and the spine being 1 ft. 6 inches thick.

5. Whales even penetrate into our seas. It is said that they are not seen in the Gulf of Cadiz before midwinter, but during the summer periods hide in a certain calm and spacious inlet, and take marvellous delight in breeding there; and that this is known to the killer whale, a creature that is the enemy of the other species and the appearance of which can be represented by no other description except that of an enormous mass of flesh with savage teeth. The killer whales therefore burst into their retreats and bite and mangle their calves or the females that have calved or are still in calf, and charge and pierce them like warships ramming. The whales being sluggish in bending and slow in retaliating, and burdened by their weight, and at this season also heavy with young or weakened by travail in giving birth, know only one refuge, to retreat to the deep sea and defend their safety by means of the ocean. Against this the killer whales use every effort to confront them and get in their way, and to slaughter them when cooped up in narrow straits or drive them into shallows and make them dash themselves upon rocks. To spectators these battles look as if the sea were raging against itself, as no winds are blowing in the gulf, but there are waves caused by the whales blowing and thrashing that are larger than those aroused by any whirlwinds. A killer whale was actually seen in the harbour of Ostia in battle with the Emperor Claudius; it had come at the time when he was engaged in completing the structure of the harbour, being tempted by the wreck of a cargo of hides imported from Gaul, and in glutting itself for a number of days had furrowed a hollow in the shallow bottom and had been banked up with sand by the waves so high that it was quite unable to turn round, and while it was pursuing its food which was driven forward to the shore by the waves its back projected far above the water like a capsized boat. Caesar gave orders for a barrier of nets to be stretched between the mouths of the harbour and setting out in person with the praetorian cohorts afforded a show to the Roman public, the soldiery hurling lances from the vessels against the creatures when they leapt up alongside, and we saw one of the boats sunk from being filled with water owing to a beast's snorting

6 Whales have their mouths in their foreheads and consequently when swimming on the surface of the water they blow clouds of spray into the air. It is universally admitted that a very few other creatures in the sea also breathe, those whose internal organs include a lung, since it is thought that no animal is able to breathe without one. Those who hold this opinion believe that the fishes possessing gills do not alternately expire and inspire air, and that many other classes even lacking gills do notan opinion which I notice that Aristotle a held and supported by many learned researches. Nor do I pretend that I do not myself immediately accept this view of theirs since it is possible that animals may also possess other respiratory organs in place of lungs, if nature so wills, just as also many possess another fluid instead of blood. At all events who can be surprised that this life-giving breath penetrates into water if he observes that it is also given back again from the water, and that it also penetrates into the earth, that much denser element, as is proved by animals that live always in underground burrows, like moles. Undoubtedly to my mind there are additional facts that make me believe that in fact all creatures in the water breathe, owing to the condition of their own naturein the first place a sort of panting that has often been noticed in fishes during the summer heat, and another form of gasping, so to speak, in calm weather, and also the admission in regard to fishes sleeping made even by those persons who are of the opposite opinionfor how can sleep occur without breathing?and moreover the bubbles caused on the surface of the water by air rising from below, and the effect of the moon in causing the bodies even of shellfish to increase in size. Above all there is the fact that it will not be doubted that fish have the sense of hearing and smell, both of which are derived from the substance of air: scent indeed could not possibly be interpreted as anything else than an infection of the air. Consequently it is open to every person to form whatever opinion about these matters he pleases. Whales do not possess gills, nor do dolphins. These two genera breathe with a tube that passes to the lung, in the case of whales from the forehead and in the case of dolphins from the back. Also sea-calves, called seals, breathe and sleep on land, as also do tortoises, about whom more shortly.

7. The swiftest of all animals, not only those of the sea, is the dolphin; it is swifter than a bird and darts faster than a javelin, and were not its mouth much below its snout, almost in the middle of its belly, not a single fish would escape its speed. But nature's foresight contributes delay, because they cannot seize their prey except by turning over on their backs. This fact especially shows their speed; for when spurred by hunger they have chased a fleeing fish into the lowest depths and have held their breath too long, they shoot up like arrows from a bow in order to breathe again, and leap out of the water with such force that they often fly over a ship's sails. They usually roam about in couples, husband and wife; they bear cubs after nine months, in the summer season, occasionally even twins. They suckle their young, as do whales, and even carry them about while weak from infancy; indeed they accompany them for a long time even when grown up, so great is their affection for their offspring. They grow up quickly, and are believed to reach their full size in 10 years. They live as much as 30 years, as has been ascertained by amputating the tail of a specimen for an experiment. They are in retirement for 30 days about the rising of the dog-star and hide themselves in an unknown manner, which is the more surprising in view of the fact that they cannot breathe under water. They have a habit of sallying out on to the land for an unascertained reason, and they do not die at once after touching earthin fact they die much more quickly if the gullet is closed up. The dolphin's tongue, unlike the usual structure of aquatic animals, is mobile, and is short and broad, not unlike a pig's tongue. For a voice they have a moan like that of a human being; their back is arched, and their snout turned up, owing to which all of them in a surprising manner answer to the name of 'Snubnose' and like it better than any other.

8. The dolphin is an animal that is not only friendly to mankind but is also a lover of music, and it can he charmed by singing in harmony, but particularly by the sound of the water-organ. It is not afraid of a human being as something strange to it, but comes to meet vessels at sea and sports and gambols round them, actually trying to race them and passing them even when under full sail. In the reign of the late lamented Augustus a dolphin that had been brought into the Lucrine Lake fell marvellously in love with a certain boy, a poor man's son, who used to go from the Baiae district to school at Pozzuoli, because fairly often the lad when loitering about the place at noon called him to him by the name of Snub-nose and coaxed him with bits of the bread he had with him for the journey,I should be ashamed to tell the story were it not that it has been written about by Maecenas and Fabianus and Flavius Alfius and many others, and when the boy called to it at whatever time of day, although it was concealed in hiding used to fly to him out of the depth, eat out of his band, and let him mount on its back, sheathing as it were the prickles of its fin, and used to carry him when mounted right across the bay to Pozzuoli to school, bringing him back in similar manner, for several years, until the boy died of disease, and then it used to keep coming sorrowfully and like a mourner to the customary place, and itself also expired, quite undoubtedly from longing. Another dolphin in recent years at Hippo Diarrhytus on the coast of Africa similarly used to feed out of people's hands and allow itself to be stroked, and play with swimmers and carry them on its back The Governor of Africa Flavianus smeared it all over with perfume, and the novelty of the scent apparently put it to sleep: it floated lifelessly about, holding aloof from human intercourse for some months as if it had been driven away by the insult; but afterwards it returned and was an object of wonder as before. The expense caused to their hosts by persons of official position who came to see it forced the people of Hippo to destroy it. Before these occurrences a similar story is told about a boy in the city of Iasus, with whom a dolphin was observed for a long time to be in love, and while eagerly following him to the shore when he was going away it grounded on the sand and expired; Alexander the Great made the boy head of the priesthood of Poseidon at Babylon, interpreting the dolphin's affection as a sign of the deity's favour. Hegesidemus writes that in the same city of Iasus another boy also, named Hermias, while riding across the sea in the same manner lost his life in the waves of a sudden storm, but was brought back to the shore, and the dolphin confessing itself the cause of his death did not return out to sea and expired on dry land. Theophrastus records that exactly the same thing occurred at Naupactus too. Indeed there are unlimited instances: the people of Amphulochus and Taranto tell the same stories about boys and dolphins; and these make it credible that also the skilled harpist Anon, when at sea the sailors were getting ready to kill him with the intention of stealing the money he had made, succeeded in coaxing them to let him first play a tune on his harp, and the music attracted a school of dolphins, whereupon he dived into the sea and was taken up by one of them and carried ashore at Cape Matapan.

9. In the region of Nismes in the Province of Narbonne there is a marsh named Latera where dolphins catch fish in partnership with a human fisherman. At a regular season a countless shoal of mullet rushes out of the narrow mouth of the marsh into the sea, after watching for the turn of the tide, which makes it impossible for nets to be spread across the channelindeed the nets would be equally incapable of standing the mass of the weight even if the craft of the fish did not watch for the opportunity. For a similar reason they make straight out into the deep water produced by the neighbouring eddies, and hasten to escape from the only place

suitable for setting nets. When this is observed by the fishermenand a crowd collects at the place, as they know the time, and even more because of their keenness for this sportand when the entire population from the shore shouts as loud as it can, calling for 'Snubnose' for the denouement of the show, the dolphins quickly hear their wishes if a northerly breeze carries the shout out to sea, though if the wind is in the south, against the sound, it carries it more slowly; but then too they suddenly hasten to the spot, in order to give their aid. Their line of battle comes into view, and at once deploys in the place where they are to join battle; they bar the passage on the side of the sea and drive the scared mullet into the shallows. Then the fishermen put their nets round them and lift them out of the water with forks. None the less the pace of some mullets leaps over the obstacles; but these are caught by the dolphins, which are satisfied for the time being with merely having killed them, postponing a meal till victory is won. The action is hotly contested, and the dolphins pressing on with the greatest bravery are delighted to be caught in the nets, and for fear that this itself may hasten the enemy's flight, they glide out between the boats and the nets or the swimming fishermen so gradually as not to open ways of escape; none of them try to get away by leaping out of the water, which otherwise they are very fond of doing, unless the nets are put below them. One that gets out thereupon carries on the battle in front of the rampart. When in this way the catch has been completed they tear in pieces the fish that they have killed. But as they are aware that they have had too strenuous a task for only a single day's pay they wait there till the following day, and are given a feed of bread mash dipped in wine, in addition to the fish.

10. Mucianus's account of the same kind of fishing in the Iasian Gulf differs in thisthe dolphins stand by of their own accord and without being summoned by a shout, and receive their share from the fishermen's hands, and each boat has one of the dolphins as its ally although it is in the night and by torchlight. The dolphins also have a form of public alliance of their own: when one was caught by the King of Lana and kept tied up in the harbour a great multitude of the remainder assembled, suing for compassion with an unmistakable display of grief, until the king ordered it to be released. Moreover small dolphins are always accompanied by a larger one as escort; and before now dolphins have been seen carrying a dead comrade, to prevent its body being torn in pieces by seamonsters.

11. The creatures called porpoises have a resemblance to dolphins (at the same time they are distinguished from them by a certain gloomy air, as they lack the sportive nature of the dolphin), but in their snouts they have a close resemblance to the maleficence of dogfish.

12. The Indian Ocean produces turtles such size that the natives roof dwelling-houses with the expanse of a single shell, and use them as boats in sailing, especially among the islands of the Red Sea. They are caught in a number of ways, but chiefly as they rise to the surface of the sea when the weather in the morning attracts them, and float across the calm waters with the whole of their backs projecting, and this pleasure of breathing freely cheats them into self-forgetfulness so much that their hide gets dried up by the heat and they are unable to dive, and go on floating against their will, an opportune prey for their hunters. They also say that turtles come ashore at night to graze and after gorging greedily grow languid and when they have gone back in the morning doze off to sleep on the surface of the water; that this is disclosed by the noise of their snoring; and that then the natives swim quietly up to them, three men to one turtle, and two turn it over on its back while the third throws a noose over it as it lies, and so it is dragged ashore by more men hauling from the beach. Turtles are caught without any difficulty in the Phoenician Sea: and at a regular period of the year they come of their own accord into the river Eleutherus in a straggling multitude.

The turtle has no teeth, but the edges of the beak are sharp on the upper side, and the mouth closing the lower jaw like a box is so hard that they can crush stones. They live on shellfish in the sea and on plants when they come ashore. They bear eggs like birds' eggs numbering up to 100 at a time; these they bury in the ground somewhere ashore, cover them with earth rammed down and levelled with their chests, and sleep on them at night. They hatch the young in the space of a year. Some people think that they cherish their eggs by gazing at them with their eyes; and that the females refuse to couple till the male places a wisp of straw on one as she turns away from him. The Cavemen have homed turtles with broad horns twisted inward like those of a lyre but movable, which they use as oars to aid themselves in swimming; the name for this horn is chelium; it is of tortoise shell of exceptional quality, but it is seldom seen, as the very sharp rocks frighten the Turtle-eater tribe, while the Cavemen, on whose coasts the turtles swim, worship them as sacred. There are also turtles living on land, and consequently called in works on the subject the Terrestrial species; these are found in the deserts of Africa in the region of the driest and most arid sands, and it is believed that they live on the moisture of dew. No other animal occurs there.

13. The practice of cutting tortoise-shell into plates and using it to decorate bedsteads and cabinets was introduced by Carvilius Pollio, a man of lavish talent and skill in if producing the utensils of luxury.

14. The aquatic animals have a variety of coverings. Some are covered with hide and hair, for instance seals and hippopotamuses; others with hide only, as dolphins, or with shell, as turtles, or a hard flinty exterior, as oysters and mussels, with rind, as lobsters, with rind and spines, as seaurchins, with scales, as fishes, with rough skin which can be used for polishing wood and ivory, as skates, with soft skin, as lampreys; others with no skin at all, as polyps.

15. The aquatic animals clad with hair are viviparousfor instance the saw-fish, the whale and the seal. The last bears its young on land; it produces afterbirth like cattle; in coupling it clings together as dogs do; it sometimes gives birth to more than two in a litter; it rears its young at the breast; it does not lead them down into the sea before the twelfth day, thereafter continually accustoming them to it. Seals are with difficulty killed unless the head is shattered. Of themselves they make a noise like lowing, whence their name 'sea-calves'; yet they are capable of training, and can be taught to salute the public with their voice and at the same time with bowing, and when called by name to reply with a harsh roar. No animal sleeps more heavily. The fins that they use in the sea also serve them on land as feet to crawl with. Their hides even when flayed from the body are said to retain a sense of the tides, and always to bristle when the tide is going out; and it is also said that the right fin possesses a soporific influence, and when placed under the head attracts sleep.

Two only of the hairless animals are viviparous, the dolphin and the viper.

16 There are 74 species of fishes, not including those that have a hard covering, of which there are thirty. We will speak of them severally in another place, for now we are dealing with the natures of specially remarkable species.

17. The tunny is of exceptional size; we are told of a specimen weighing a third of a ton and having a tail 3 ft. 4 in. broad. Fish of no less size also occur in certain rivers, the catfish in the Nile, the pike in the Rhine, the sturgeon in the Po, a fish that grows so fat from sloth that it sometimes reaches a thousand pounds; it is caught with a hook on a chain and only drawn out of the water by teams of oxen. And this monster is killed by the bite of a very small fish called the anchovy which goes for a particular vein in its throat with remarkable voracity. The catfish ranges about and goes for every living creature wherever it is, often dragging down horses when swimming. A fish very like a sea-pig is drawn out with teams of oxen, especially in the river Main in Germany, and in the Danube with weeding-hooks; an exceptionally large species with no internal framework of bones or vertebrae and very sweet flesh is recorded in the Dnieper. In the Ganges in India there is a fish called the platanista with a dolphin's beak and tail, but 24 ft. long. Statius Sebosus gives an extremely marvellous account of worms in the same river that have a pair of gills measuring 90 ft; they are deep blue in colour, and named from their appearance; he says that they are so strong that they carry off elephants coming to drink by gripping the trunk in their teeth.

18. Male tunnies have no fin under the belly. In spring time they enter the Black Sea from the Mediterranean in shoals, and they do not spawn anywhere else. The name of cordvla is given to the fry, which accompany the fish when they return to the sea in autumn after spawning; in the spring they begin to be called mudfish or pelamydes (from the Greek for 'mud'), and when they have exceeded the period of one year they are called tunny. These fish are cut up into parts, and the neck and belly are counted a delicacy, and also the throat provided it is fresh, and even then it causes severe flatulence; all the rest of the tunny, with the flesh entire, is preserved in salt: these pieces are called melandrya, as resembling splinters of oakwood. The cheapest of them are the parts next the tail, because they lack fat, and the parts most favoured are those next the throat; whereas in other fish the parts round the tail are most in use. At the pelamys stage they are divided into choice slices and cut up small into a sort of little cube.

19. Fishes of all kinds grow up exceptionally fast, especially in the Black Sea; this is due to the fresh water carried into it by a large number of rivers. The name of scomber is given to a fish whose growth in size can be noticed daily. This fish and the pelamys in company with the tunny enter the Black Sea in shoals in search of less brackish feeding-grounds, each kind with its own leaders, and first of all the mackerel, which when in the water is sulphur-coloured, though out of water it is the same colour as the other kinds. These fill the fish-ponds of Spain, the tunny not going with them.

20. But no creature harmful to fish enters the Black Sea besides seals and small dolphins. The tunny enter it by the right bank and go out of it by the left; this is believed to occur because they can see better with the right eye, being by nature dim of sight in both eyes. In the channel of the Thracian Bosphorus joining the Sea of Marmora with the Black Sea, in the actual narrows of the channel separating Europe and Asia, there is a rock of marvellous whiteness that shines through the

water from the bottom to the surface, near Chalcedon on the Asiatic side. The sudden sight of this always frightens them. and they make for the opposite promontory of Istanbul in a headlong shoal; this is the reason why that promontory has the name of the Golden Horn. Consequently all the catch is at Istanbul, and there is a great shortage at Chalcedon, owing to the 1000 yards of channel flowing in between. But they wait for a north wind to blow so as to go out of the Black Sea with the current, and are only taken a when entering the harbour of Istanbul. In winter they do not wander; wherever winter catches them, there they hibernate till the equinox. They are also frequently seen from the stern of vessels proceeding under sail, accompanying them in a remarkably charming manner for periods of several hours and for a distance of some miles, not being scared even by having a harpoon repeatedly thrown at them. Some people give the name of pilot-fish to the tunny that do this. Many pass the summer in the Sea of Marmora without entering the Black Sea; the same is the case with the sole, though the turbot does enter it. Nor does the sepia occur there, though the cattle-fish is found. Of rock-fish the seabream and whiting are lacking, as are some shell-fish, though oysters are plentiful; but they all winter in the Aegean. Of those entering the Black Sea the only kind that never returns is the bichia or sardineit will be convenient to use the Greek names in most cases, as different districts have called the same species by a great variety of namesbut these alone enter the Danube and float down from it by its underground channels into the Adriatic, and consequently there also they are regularly seen going down stream and never coming up from the sea. The season for catching tunny is from the rise of the Pleiades to the setting of Arcturus; during the rest of the winter time they lurk at the bottom of the water unless tempted out by a mild spell or at full moon. They get fat even to the point of bursting. The tunny's longest life is two years.

21. There is a small animal shaped like a scorpion, of the size of a spider. This attaches with a spike under the fin of both the tunny and the fish called sword-fish, which often exceeds the size of a dolphin, and torments them so painfully that they frequently jump out of the water into ships. This is also done on other occasions from fear of the violence of other fish, especially by mullet, which are so exceptionally swift that they sometimes leap right over ships that lie across their path.

22. In this department of nature also there are cases of augury; even fish have foreknowledge of events. During the Sicilian War when Augustus was walking on the shore a fish leapt out of the sea at his feet, a sign which the priests interpreted as meaning that although Sextus Pompeius was then adopting Neptune as his fatherso glorious were his naval exploitsyet those who at that time held the seas would later be beneath the feet of Caesar.

23. Female fish are larger than the males. In one kind there are no males at all, as is the case with red mullet and sea-perch, for all those caught are heavy with eggs. Almost every kind with scales is gregarious. Fish are caught before sunrise; at that of hour their sight is most fallible. In the night they repose, but on bright nights they can see as well as by day. People also say that scraping the bottom helps the catch, and that consequently more are caught at the second haul than at the first. Fish are fondest of the taste of oil, but next to that they enjoy and derive nourishment from moderate falls of rain: in fact even reeds although growing in a marsh nevertheless do not grow up without rain; and besides, fishes everywhere die when kept continually in the same water, if there is no inflow.

24. All fish feel a very cold winter, but most of all those that are believed to hate a stone in their head, for instance the bass, the chromis, the ombre and the phagrus. When the winter has been severe a great many are caught blind. Consequently in the winter months they lie hidden in eaves (like cases that we have recorded in the class of land-animals), particularly the hippuris and blackfish, which are not caught in winter except on a few regular days that are always the same, and also the lamprey and the orphus, the conger and perch and all rockfish. It is indeed reported that the electric ray, the plaice and the sole hide through the winters in the ground, that is, in a hole scraped out at the bottom of the sea.

25. Some fish again being unable to endure heat hide for 8 or 9 weeks during the heats of midsummer, for instance the grayling, the haddock and the gilt-bream. Of river fish the catlish has a stroke at the rise of the dog-star, and at other times is always made drowsy by lightning. This is thought to happen to the carp even in the sea. And beside this the whole sea is conscious of the rise of that star, as is most clearly seen in the Dardanelles, for seaweed and fishes float on the surface, and everything is turned up from the bottom.

26. It is an amusing trait in the mullet that when frightened it hides its head and thinks it is entirely concealed. The same fish is so incautious in its wantonness that in Phoenicia and in the Province of Narbonne at the breeding season a male mullet from the fishponds is sent out into the sea with a long line tied to its gills through its mouth and when it is drawn back by the same line the females follow it to the shore, and again the males follow a female at the laying season. 27. In old days the sturgeon was held to be the noblest of the fishes, being the only one with its scales turned towards the mouth, in the opposite direction to the one in which it swims; but now it is held in no esteem, which for my part I think surprising, as it is a fish seldom to be found. One name for it is the elops.

28. Cornelius Nepos and the mime-writer Laberius have recorded that at a later period the chief rank belonged to the bass and the haddock. The kind of bass most praised is the one called the woolly bass, from the whiteness and softness of its flesh. There are two kinds of haddockthe collyrus, which is the smaller, and the bacchus, which is only caught in deep water, and consequently is preferred to the former. But among bass those caught in a river are preferred.

29. Nowadays the first place is given to the wrasse, which is the only fish that is said to chew the cud and to feed on grasses and not on other fish. It is especially common in the Carpathian Sea; it never of its own accord passes Cape Lectum in the Troad. Some wrasse were imported from there in the principate of Tiberius Claudius by one of his freedmen, Optatus, Commander of the Fleet, and were distributed and scattered about between the mouth of the Tiber and the coast of Campania, care being taken for about five years that when caught they should be put back into the sea. Subsequently they have been frequently found on the coast of Italy, though not caught there before; and thus greed has provided itself with additional dainties by cultivating fish, and has bestowed on the sea a new denizenso that nobody must be surprised that foreign birds breed at Rome. The next place belongs at all events to the liver of the lamprey that strange to say the Lake of Constance in Raetia in the Central Alps also produces to rival the marine variety.

30. Of other fish of a good class the red mullet stands first in popularity and also in plentifulness, though its size is moderate and it but rarely exceeds 2 lbs, in weight, nor does it grow larger when kept in preserves and fishponds. This size is only produced by the northern ocean and in its westernmost part. For the rest, there are several kinds of mullet. For it feeds on seaweed, bivalves, mud and the flesh of other fish; and it is distinguished by a double beard on the lower lip. The mullet of cheapest kind is called the mud-mullet. This variety is always accompanied by another fish named sea-bream, and it swallows down as fodder mire stirred up by the sea-bream digging. The coast mullet also is not in favour. The most approved kind have the flavour of an oyster. This variety has the name of shoe-mullet, which Fenestella thinks was given it from its colour. It spawns three times a yearat all events that is the number of times that its fry is seen. The leaders in gastronomy say that a dying mullet shows a large variety of changing colours, turning pale with a complicated modification of blushing scales, at all events if it is looked at when contained in a glass bowl. Marcus Apicius, who had a natural gift for every ingenuity of luxury, thought it specially desirable for mullets to be killed in a sauce made of their companions, garumfor this thing also has procured a designationand for fish-paste to be devised out of their liver.

31. With a fish of this kind one of the proconsular body, Asinius Celer, in the principate of Gaius, issued a challengeit is not so easy to say who won the matchto all the spendthrifts by giving 8000 sesterces for a mullet. The thought of this sidetracks the mind to the consideration of the people who in their complaints about luxury used to protest that cooks were being bought at a higher price per man than a horse; but now the price of three horses is given for a cook, and the price of three cooks for a fish, and almost no human being has come to be more valued than one that is most skilful in making his master bankrupt. Licinius Mucianus has recorded the capture in the Red Sea of a mullet weighing 80 lbs.; what price would our epicures have paid for it if it had been found on the coasts near the city?

32. It is also a fact of nature that different fishes hold the first rank in different placesthe blackfish in Egypt, the John Dory (also called the carpenter-fish) at Cadiz, the stockfish in the neighbourhood of Iviza, though elsewhere it is a disgusting fish, and everywhere it is unable to be cooked thoroughly unless it has been beaten with a rod; in Aquitaine the river salmon is preferred to all sea-fish.

33. Some fish have numerous gills, others single ones, others double. With the gills they discharge the water taken in by the mouth. Hardening of the scales, which are not alike in all fishes, is a sign of age. There are two lakes in Italy at the foot of the Alps, named Como and Maggiore, in which every year at the rising of the Pleiades fish are found that are remarkable for close-set and very sharp scales, shaped like shoe-nails, but they are not commonly seen for a longer period than about a month from then.

34. Arcadia also has a marvel in its climbing perch, so called because it climbs out on to the land to sleep. In the district of the river Clitorius this fish is said to have a voice and no gills; the same variety is by some people called the Adonis fish.

35. The fish called the sea-mouse also comes out on to the land, as do the polypus and the lamprey; so also does a certain kind of fish in the rivers of India, and then jumps hack

againfor in most cases there is an obvious purpose in getting across into marshes and lakes so as to produce their offspring safe, as in those waters there are no creatures to devour their young and the waves are less fierce. Their understanding these reasons and their observing the changes of the seasons would seem more surprising to anybody who considers what fraction of mankind is aware that the biggest catch is made when the sun is passing through the sign of the Fishes.

36. Some sea-fish are flat, for instance the turbot, the sole and the flounder, which differs from the turbot only in the posture of its bodythe turbot lies with the right side uppermost and the flounder with the left; while other sea-fish are long, as the lamprey and the conger.

37. Consequently differences also occur in the fins, which are bestowed on fish instead of feet; none have more than four, some have three, some two, certain kinds none. In the Lago di Celano, but nowhere else, there is a fish that has eight fins to swim with. Long slippery fish like eels and congers generally have two fins, others have none, for instance, the lamprey which also has no gills. All this class use the sea as snakes do the land, propelling themselves by twisting their bodies, and they also crawl on dry land; consequently this class are also longer-lived. Some of the flat-fish too have not got fins, for example, the stingrayfor these swim merely by means of their breadthand the kinds called soft fish, such as polyps, since their feet serve them instead of fins.

38. Eels live eight years. They can even last five or six days at a time out of water if a north wind is blowing, but not so long with a south wind. But the same fish cannot endure winter in shallow nor in rough water; consequently they are chiefly caught at the rising of the Pleiades as the rivers are then specially rough. They feed at night. They are the only fish that do not float on the surface when dead. There is a lake called Garda in the territory of Verona through which flows the river Mincio, at the outflow of which on a yearly occasion, about the month of October, when the lake is made rough evidently by the autumn star, they are massed together by the waves and rolled in such a marvellous shoal that masses of fish, a thousand in each, are found in the receptacles constructed in the river for the purpose.

39. The lamprey spawns in any month, although all other fish have fixed breeding seasons. Its eggs grow very quickly. Lampreys are commonly believed to crawl out on to dry land and to be impregnated by copulating with snakes. Aristotle gives the name of zmyrus to the male fish which generates, and says that the difference is that the lamprey is spotted and feeble whereas the zmyrus is self-coloured and hardy, and has teeth projecting outside the mouth. In Northern Gaul all lamprevs have seven spots on the right jaw arranged like the constellation of the Great Bear, which are of a bright golden colour as long as the fish are alive, and are extinguished when they are deprived of life. Vedius Pollio, Knight of Rome, a member of the Privy Council under the late lamented Augustus, found in this animal a means of displaying his cruelty when he threw slaves sentenced to death into ponds of lampreysnot that the wild animals on land were not sufficient for this purpose, but because with any other kind of creature he was not able to have the spectacle of a man being torn entirely to pieces at one moment. It is stated that tasting vinegar particularly drives them mad. Their skin is very thin, whereas that of eels is rather thick, and Verrius records that it used to be used for flogging boys who were sons of citizens, and that consequently it was not the practice for them to be punished with a fine.

40. There is a second class of flatfish that has gristle instead of a backbone, for instance rays, stingrays, skates, the electric ray, and those the Greek names for which mean 'ox,' 'sorceress', 'eagle' and 'frog.' This group includes the squalus also, although that is not a flatfish. These Aristotle designated in Greek by the common name of selachians, giving them that name for the first time; but we cannot distinguish them as a class unless we like to call them the cartilaginea. But all such fish are carnivorous, and they feed lying on their backs, as we said in the case of dolphins; and whereas all other fish are oviparous, this kind alone with the exception of the species called the sea-firog is viviparous, like the creatures termed cetaceans.

41. There is a quite small fish that frequents rocks, called the sucking-fish. This is believed to make ships go more slowly by sticking to their hulls, from which it has received its name; and for this reason it also has an evil reputation for supplying a love-charm and for acting as a spell to hinder litigation in the courts, which accusations it counterbalances only by its laudable property of stopping fluxes of the womb in pregnant women and holding back the offspring till the time of birth. It is not included however among articles of diet. It is thought by some to have feet, but Aristotle denies this, adding that its limbs resemble wings.

Mucianus states that the murex is broader than the purple, and has a mouth that is not rough nor round and a beak that does not stick out into corners but shuts together on either side like a bivalve shell; and that owing to murexes clinging to the sides a ship was brought to a standstill when in full sail before the wind, carrying despatches from Periander ordering

THE GRAND BIBLE

some noble youths to be castrated, and that the shell-fish that rendered this service are worshipped in the shrine of Venus at Cnidus. Trebius Niger says that it is a foot long and four inches wide, and hinders ships, and moreover that when preserved in salt it has the power of drawing out gold that has fallen into the deepest wells when it is brought near them.

42. The maena changes its white colour and. becomes blacker in summer. The lamprey also changes colour, being white all the rest of the time but variegated in spring. Also it is the only fish that lays its eggs in a nest, which it builds of seaweed.

43. The swallow-fish flies just exactly like a bird, and so does the kite-fish. The fish on this account called the lamp-fish rises to the surface of the sea, and on calm nights gives a light with its fiery tongue which it puts out from its mouth. The fish that has got its name from its horns raises these up about 18 inches out of the sea. The sea-snake, again, when caught and placed on the sand, with marvellous rapidity digs itself a hole with its beak.

44. We will now speak of the bloodless fishes. Of these there are three kinds: first those which are called soft fish, then those covered with thin rinds, and lastly those enclosed in hard shells. The soft are the cattle-fish, the sepia, the polyp and the others of that kind. They have the head between the feet and the belly, and all of them have eight little feet. In the sepia and cuttle-fish two of these feet are extremely long and rough, and by means of these they carry food to their months, and steady themselves as with anchors in a rough sea; but all he rest are feelers which they use for catching their prey.

45. The cuttle-fish even flies, raising itself out of the water, as also do the small scallops, like an arrow. The males of the genus sepia are variegated and darker in colour, and they are more resolute: when a female is struck with a trident they come to her assistance, whereas a female flees when a male is struck. But both sexes on perceiving they are being caught hold of pour out a dark fluid which these animals have instead of blood, so darkening the water and concealing themselves.

46. There are many sorts of polyp. The land kinds are larger than the marine. They use all their arms as feet and hands, but employ the tail, which is forked and pointed, in sexual intercourse. The polyps have a tube in their back through which they pass the seawater, and they shift this now to the right side and now to the left. They swim with their head on one side, this while they are alive being hard as though blown out. Otherwise they remain adhering with a kind of suction, by means of a sort of suckers spread over their arms: throwing themselves backward they hold on so that they cannot be torn away. They do not cling to the bottom of the sea, and have less holding-power when full-grown. They alone of the soft creatures go out of the water on to dry land, provided it has a rough surface: they hate smooth surfaces. They feed on the flesh of shellfish, the shells of which they break by enfolding them with their tentacles; and consequently their lair can be detected by the shells lying in front of it. And though the polyp is in other respects deemed a stupid animal, inasmuch as it swims towards a man's hand, it has a certain kind of sense in its domestic economy: it collects everything into its home, and then after it has eaten the flesh puts out the refuse and catches the little fishes that swim up to it. It changes its colour to match its environment, and particularly when it is frightened. The notion that it gnaws its own arms is a mistake, for this is done to it by the congers: but the belief that its tails grow again, as is the case with the gecko and the lizard, is correct.

47. But among outstanding marvels is the creature called the nautilus, and by others the pilot-fish. Lying on its back it comes to the surface of the sea, gradually raising itself up in such a way that by sending out all the water through a tube it so to speak unloads itself of bilge and sails easily. Afterwards it twists back its two foremost arms and spreads out between them a marvellously thin membrane, and with this serving as a sail in the breeze while it uses its other arms underneath it as oars, it steers itself with its tail between them as a rudder. So it proceeds across the deep mimicking the likeness of a fast cutter, if any alarm interrupts its voyage submerging itself by sucking in water.

48. One variety of the polypus kind is the stink-polyp, named from the disagreeable smell of its head, which causes it to be the special prey of the lamprey.

Polyps go into hiding for periods of two months. They do not live more than two years; but they always die of consumption, the females more quickly and usually as a result of bearing offspring.

We must also not pass over the facts as to the polyp ascertained when Lucius Lucullus was governor of Baetica, and published by one of his staff, Trebius Niger; he says that they are extremely greedy for shell-fish, and that these close their shells at a touch and cut off the polyp's tentacles, so retaliating by obtaining food from their would-be robber. Shell-fish do not possess sight or any other sense except consciousness of food and danger. Consequently the polyps lie in wait for the shell-fish to open, and placing a stone between the shells, not on the fish's body so that it may not be ejected by its throbbing, thus go to work at their ease, and drag out the flesh, while the shell-fish try to shut up, but in vain, as

they are wedged open: so clever are even the most stupid of animals. Moreover Niger asserts that no animal is more savage in causing the death of a man in the water; for it struggles with him by coiling round him and swallows him with its sucker-cups and drags him asunder by its multiple suction, when it attacks men that have been shipwrecked or are diving. But should it be turned over, its strength gets feebler; for when polyps are lying on their backs they stretch themselves out. The rest of the facts reported by the same authority may possibly be thought to approximate to the miraculous. In the fishponds at Carteia a polyp was in the habit of getting into their uncovered tanks from the open sea and there foraging for salted fisheven the smell of which attracts all sea creatures in a surprising way, owing to which even fish-traps are smeared with themand so it brought on itself the wrath of the keepers, which owing to the persistence of the theft was beyond all bounds. Fences were erected in its way, but it used to scale these by making use of a tree, and it was only possible to catch it by means of the keen scent of hounds. These surrounded it when it was going back at night, and aroused the guards, who were astounded by its strangeness; in the first place its size was unheard of and so was its colour as well, and it was smeared with brine and had a terrible smell; who would have expected to find a polyp there, or who would recognize it in such circumstances? They felt they were pitted against something uncanny, for by its awful breath it also tormented the dogs, which it now scourged with the ends of its tentacles and now struck with its longer arms, which it used as clubs; and with difficulty they succeeded in despatching it with a number of three-pronged harpoons. They showed its head to Lucullusit was as big as a cask and held 90 gallons, -- and (to use the words of Trebius himself) 'its beards which one could hardly clasp round with both one's arms, knotted like clubs, 30 ft. long, with suckers or cups like basins holding three gallons, and teeth corresponding to its size. Its remains, kept as a curiosity, were found to weigh 700 lbs. Trebius also states that cuttlefish of both species of the same size have been driven ashore on that coast. In our own seas one kind is taken that measures 7 ft. in length and the other kind 3 ft. These fish also do not live more than two years.

49. Mucianus has stated that he has also seen in the Dardanelles another creature resembling a ship under sail: it is a shell with a keel like a boat, and a curved stern and beaked bow. In this (he says) the nauplius, a creature like the cuttlefish, secretes itself, merely by way of sharing the game. The manner in which this takes place is twofold: in calm weather the carrier shell strikes the water by dipping its flappers like oars, but if the breezes invite, the same flappers are stretched out to serve as a rudder and the curves of the shells are spread to the breeze. The former creature delights (he continues) to carry and the latter to steer, and this pleasure penetrates two senseless things at onceunless perhaps human calamity forms part of the motive, for it is an established fact that this is a disastrous omen for mariners.

50. In the bloodless class, the langouste is protected by a fragile rind. Langoustes stay in retirement for five months in each year; and likewise crabs, which go into hiding at the same season; and both species discard their old age at the beginning of spring in the same way as snakes do, by renewing their skins. All other aquatic species swim, but langoustes float about in the manner of reptiles; if no danger threatens they go forward in a straight course with their horns, which are buttoned by their own rounded ends, stretched out at their sides, but at a moment of alarm they advance slanting sideways with their horns held erect. They use their horns in fighting one another. The langouste is the only animal whose flesh is of a yielding texture with no hardness, unless it is boiled alive its hot water. Langoustes live in rocky places, whereas crabs live on soft mud. In winter they haunt sunny shores, but in summer they retire into the dim depths of the sea. All creatures of this class suffer in winter, but get fat in autumn and spring, and more so at full moon, because the moon mellows them with its warm glow by night.

51. The kinds of crab are the carabus, the crayfish, the spider-crab, the hermit-crab, the Heraclean crab, the lioncrab and other inferior species. The carabus differs from the other crabs by its tail; in Phoenicia it is called the horse-crab, being so swift that it is impossible to overtake it. Crabs are long-lived. They have eight feet, all curved crooked; the front foot is double in the female and single in the male. They also have two claws with denticulated nippers: the upper half of the forepart of these moves and the lower half is fixed. The right claw is the larger in every specimen. Sometimes crabs all collect together in a flock. They cannot make the mouth of the Black Sea against the current, and consequently when they are going out of it they travel round in a circle and appear to be following a beaten track. The one called the pea-crab is the smallest of the whole tribe, and consequently very liable to injury. It has the cunning to stow itself in empty bivalve shells and to shift into roomier ones as it grows bigger. When alarmed crabs can retreat backwards with equal speed. They fight duels with one another like rams; charging with horns opposed. They afford a remedy against snake-bite. It is related that when the sun is passing through the sign of Cancer the bodies of crabs also when they expire are transformed into scorpions during the drought.

The sea-urchin, which has spines instead of feet, belongs to the same genus. These creatures can only go forward by rolling over and over, and consequently they are often found with their prickles worn off. Those of them with the longest spines are called echinus cidaris, and the smallest are called cups. They have not all the same transparent colour: in the district of Torone some are born white, with a small spine. The eggs of all have a bitter taste; they are laid in clutches of five. Their mouths are in the middle of their body, on the under side. It is said that they can forecast a rough sea and that they take the precaution of clutching stones and steadying their mobility by the weight: they do not want to wear away their spines by rolling about. When sailors see them doing this they at once secure their vessels with more anchors.

In the same family are water and land snails, that protrude out of their abode and shoot out and draw in two horns as it were. They have no eyes, and consequently explore the way in front of them with their little horns.

Sea-scallops are held to belong to the same class, which also retire into hiding at seasons of extreme cold and extreme heat; and piddocks, which shine as if with fire in dark places, even the mouth of persons eating them.

52. We now come to the purples and the varieties of shellfish, which have a stronger shell. The latter display in great variety nature's love of sport: they show so many differences of colour, and also of shapebeing flat, hollow, long, crescentshaped, circular, semi-circular, humped, smooth, wrinkled, serrated, furrowed; with the crest bent into the shape of a purple, the edge projecting into a sharp point, or spread outwards, or folded inwards; and again picked out with stripes or with flowing locks or with curls, or parted in little channels or like the teeth of a comb, or corrugated like tiles. or reticulated into lattice-work, or spread out slant-wise or straight, close-packed, diffused, curled; tied up in a short knot, or linked up all down the side, or opened so as to shut with a snap, or curved so as to make a trumpet. Of this species the Venus-shell sails like a ship, and projecting its hollow portion and setting it to catch the wind goes voyaging over the surface of the water. The scallop gives a leap and soars out of the water, and it also uses its own shell as a boat.

53. But why do I mention these trifles when their moral corruption and luxury spring from no other source in greater abundance than from the genus shell-fish? It is true that of the whole of nature the sea is most detrimental to the stomach in a multitude of ways, with its multitude of dishes and of appetizing kinds of fish to which the profits made by those who catch them spell danger. But what proportion do these form when we consider purple and scarlet robes and pearls! It had been insufficient, for sooth, for the seas to be stowed into our gullets, were they not carded on the hands and in the ears and on the head and all over the body of women and men alike What connexion is there between the sea and our clothing, between the waves and waters and woollen fabric? We only enter that element in a proper manner when we are naked! Granted that there is so close an alliance between it and our stomach, but what has it to do with our backs? Are we not content to feed on dangers without also being clothed with them? Is it that the rule that we get most satisfaction from luxuries costing a human life to procure holds good for the whole of our anatomy?

54. The first place therefore and the topmost rank among all things of price is held by pearls. These are sent chiefly by the Indian Ocean, among the huge and curious animals that we have described as coming across all those seas over that wide expanse of lands from those burning heats of the sun. And to procure them for the Indians as well, men go to the islandsand those quite few in number: the most productive is Ceylon, and also Stoidis, as we said in our circuit of the world, and also the Indian promontory of Perimula; but those round Arabia on the Persian Gulf of the Red Sea are specially praised.

The source and breeding-ground of pearls are shells not much differing from oyster-shells. These, we are told, when stimulated by the generative season of the year gape open as it were and are filled with dewy pregnancy, and subsequently when heavy are delivered, and the offspring of the shells are pearls that correspond to the quality of the dew received: if it was a pure inflow, their brilliance is conspicuous but if it was turbid, the product also becomes dirty in colour. Also if the sky is lowering (they say) the pearl is pale in colour: for it is certain that it was conceived from the sky, and that pearls have more connexion with the sky than with the sea, and derive from it a cloudy hue, or a clear one corresponding with a brilliant morning. If they are well fed in due season, the offspring also grows in size. If there is lightning, the shells shut up, and diminish in size in proportion to their abstinence from food; but if it also thunders they are frightened and shut up suddenly, producing what are called 'wind-pearls,' which are only inflated with an empty, unsubstantial show: these are the pearls' miscarriages. Indeed a healthy offspring is formed

THE GRAND BIBLE

with a skin of many thicknesses, so that it may not improperly be considered as a hardening of the body; and consequently experts subject them to a cleansing process. I am surprised that though pearls rejoice so much in the actual sky, they redden and lose their whiteness in the sun, like the human body; consequently sea-pearls preserve a special brilliance, being too deeply immersed for the rays to penetrate; nevertheless even they get yellow from age and doze off with wrinkles, and the rigour that is sought after is only found in youth. Also in old age they get thick and stick to the shells, and cannot be torn out of these except by using a file. Pearls with only one surface, and round on that side but flat at the back, are consequently termed tambourine pearls; we have seen them clustering together in shells that owing to this enrichment were used for carrying round perfumes. For the rest, a large pearl is soft when in the water but gets hard as soon as it is taken out.

55. When a shell sees a hand it shuts itself up and conceals its treasures, as it knows that it is sought for on their account; and if the hand is inserted first it cuts it off with its sharp edge, the most just penalty possible for it is armed with other penalties also, as for the most part it is found among rocks. while even in deep water it has sea-dogs a in attendanceyet nevertheless these do not protect it against women's ears. Some accounts say that clusters of shells like bees have one of their number, a specially large and old shell, as their leader, one marvellously skilful in taking precautions; and that these leader-shells are diligently sought for by pearl-divers, as when they are caught all the rest stray about and easily get shut up in the nets, subsequently a quantity of salt being poured over them in earthenware jars; this eats away all the flesh, and a sort of kernels in their bodies, which are pearls, fall to the bottom

56. There is no doubt that pearls are worn away by use, and that lack of care makes them change their colour. Their whole value lies in their brilliance, size, roundness, smoothness and weight, qualities of such rarity that no two pearls are found that are exactly alike: this is doubtless the reason why Roman luxury has given them the name of 'unique gems,' the word not existing in Greece, and indeed among foreign races, who discovered this fact, the only name for them is margarita. There is also a great variety in their actual brilliance: it is brighter with those found in the Red Sea, whereas those found in the Indian Ocean resemble flakes of mica, though they excel others in size. The highest praise given to their colour is for them to be called alum-coloured. The longer ones also have a charm of their own. Those that end in a wider circle, tapering lengthwise in the shape of perfume-caskets, are termed 'probes.' Women glory in hanging these on their fingers and using two or three for a single-earring, and foreign names for this luxury occur, names invented by abandoned extravagance, inasmuch as when they have done this they call them 'castanets,' as if they enjoyed even the sound and the mere rattling together of the pearls; and now-a-days even poor people covet themit is a common saying that a pearl is as good as a lackey for a lady when she walks abroad! And they even use them on their feet, and fix them not only to the laces of their sandals but all over their slippers. In fact, by this time they are not content with wearing pearls unless they tread on them, and actually walk on these unique gems!

There used to be commonly found in our own sea, and more frequently on the coasts of the Thracian Bosphorus, small red gems contained in the shells called mussels. But in Acarnania there grows what is termed the sea-pen; which shows that pearls are not born in only one kind of shell, for Juba also records that the Arabs have a shell resembling a toothed comb, that bristles like a hedgehog, and has an actual pearl, resembling a hailstone, in the fleshy part; this kind of shell is not imported to Rome. And there are not found in Acamania the formerly celebrated pearls of an exceptional size and almost a marble colour. Better ones are found round Actium, but these too are small, and in sea-board Mauretania. Alexander the Encyclopaedist and Sudines think that they grow old and let their colour evaporate.

57. It is clear that they are of a fine substance, because no fall can break them. Also they are not always found in the middle of the flesh, but in a variety of places, and before now we have seen them even at the extreme edges, as though in the act of passing out of the shell; and in some cases we have seen four or five pearls in one shell. In weight few specimens have hitherto exceeded half an ounce by more than one scruple. It is established that small pearls of poor colour grow in Britain, since the late lamented Julius desired it to be known that the breastplate which he dedicated to Venus Genetrix in her temple was made of British pearls.

58. I have seen Lollia Paulina, who became the consort of Gaius, not at some considerable or solemn ceremonial celebration but actually at an ordinary betrothal banquet, covered with emeralds and pearls interlaced alternately and shining all over her head, hair, ears, neck and fingers, the sum total amounting to the value of 40,000,000 sesterces, she herself being ready at a moment's notice to give documentary proof of her title to them; nor had they been presents from an extravagant emperor, but ancestral possessions, acquired in

fact with the spoil of the provinces. This is the final outcome of plunder, it was for this that Marcus Lollius disgraced himself by taking gifts from kings in the whole of the East, and was cut out of his list of friends by Gaius Caesar son of Augustus and drank poisonthat his granddaughter should be on show in the lamplight covered with 40,000,000 sesterces! Now let some one reckon up on one side of the account how much Curius or Fabricius carried in their triumphs, and picture to himself the spoils they displayed, and on the other side Lollia, a single little lady reclining at the Emperor's sideand would he not think it better that they should have been dragged from their chariots than have won their victories with this result? Nor are these the topmost instances of luxury. There have been two pearls that were the largest in the whole of history; both were owned by Cleopatra, the last of the Queens of Egyptthey had come down to her through the hands of the Kings of the East. When Antony was gorging daily at recherch banquets, she with a pride at once lofty and insolent, queenly wanton as she was, poured contempt on all his pomp and splendour, and when he asked what additional magnificence could be contrived, replied that she would spend 10.000,000 sesterces on a single banquet. Antony was eager to learn how it could be done, although he thought it was impossible. Consequently bets were made, and on the next day, when the matter was to be decided, she set before Antony a banquet that was indeed splendid, so that the day might not be wasted, but of the kind served every dayAntony laughing and expostulating at its niggardliness. But she vowed it was a mere additional douceur, and that the banquet would round off the account and her own dinner alone would cost 10,000,000 sesterces, and she ordered the second course to be served. In accordance with previous instructions the servants placed in front of her only a single vessel containing vinegar, the strong rough quality of which can melt pearls. She was at the moment wearing in her ears that remarkable and truly unique work of nature. Antony was full of curiosity to see what in the world she was going to do. She took one earring off and dropped the pearl in the vinegar, and when it was melted swallowed it. Lucius Plancus, who was umpiring the wager, placed his hand on the other pearl when she was preparing to destroy it also in a similar way, and declared that Antony had lost the battlean ominous remark that came true. With this goes the story that, when that queen who had won on this important issue was captured, the second of this pair of pearls was cut in two pieces, so that half a helping of the jewel might be in each of the ears of Venus in the Pantheon at Rome.

59. They will not carry off this trophy, and will be robbed even of the record for luxury! A predecessor had done this at Rome in the case of pearls of great value, Clodius, the son of the tragic actor Aesopus, who had left him his heir in a vast estate; so that Antony cannot take too much pride in his triumvirate when compared with one who was virtually an actor, and who had indeed been led on to this display not by any wagerwhich would make it more royalbut to discover by experiment, for the honour of his palate, what is the exact flavour of pearls; and when they proved marvellously acceptable, in order not to keep the knowledge to himself he gave his guests also a choice pearl apiece to swallow.

Fenestella records that they came into common use at Rome after the reduction of Alexandria under our sway, but that small and cheap pearls first came in about the period of Sulla which is clearly a mistake, as Aelius Stilo states that the distinctive name was given to large pearls just at the time of the wars of Jugurtha.

60. And nevertheless this article is an almost everlasting piece of propertyit passes to its owner's heir, it is offered for public sale like some landed estate; whereas every hour of use wears away robes of scarlet and purple, which the same mother, luxury, has made almost as costly as pearls.

Purples live seven years at most. They stay in hiding like the murex for 30 days at the time of the rising of the dog-star. They collect into shoals in springtime, and their rubbing together causes them to discharge a sort of waxy viscous slime. The murex also does this in a similar manner, but it has the famous flower of purple, sought after for dveing robes, in the middle of its throat: here there is a white vein of very scanty fluid from which that precious dye, suffused with a dark rose colour, is drained, but the rest of the body produces nothing. People strive to catch this fish alive, because it discharges this juice with its life; and from the larger purples they get the juice by stripping off the shell, but they crush the smaller ones alive with the shell, as that is the only way to make them disgorge the juice. The best Asiatic purple is at Tyre, the best African is at Meninx and on the Gaetulian coast of the Ocean, the best European in the district of Sparta. The official rods and axes of Rome clear a path, and it also marks the honourable estate of boyhood; it distinguishes the senate from the knighthood, it is called in to secure the favour of the gods: and it adds radiance to every garment, while in a triumphal robe it is blended with gold. Consequently even the mad lust for the purple may be excused; but what is the cause of the prices paid for purple-shells, which have an unhealthy odour

when used for dye and a gloomy tinge in their radiance resembling an angry sea?

The purple's tongue is an inch long; when feeding it uses it for piercing a hole in the other kinds of shell-fish, so hard is its point. These fish die in fresh water and wherever a river discharges into the sea, but otherwise when caught they live as much as seven weeks on their own slime. All shellfish grow with extreme rapidity, especially the purple-fish; they reach their size in a year.

61. But if having come to this point our exposition were to pass over elsewhere, luxury would undoubtedly believe itself defrauded and would find us guilty of remissness. For this reason we will pursue the subject of manufactures as well, so that just as the principle of foodstuffs is learnt in food, so everybody who takes pleasure in the class of things in question may be well-informed on the subject of that which is the prize of their mode of life. Shellfish supplying purple dyes and scarletsthe material of these is the same but it is differently blended--are of two kinds: the whelk is a smaller shell resembling the one that gives out the sound of a trumpet, whence the reason of its name, by means of the round mouth incised in its edge; the other is called the purple, with a channelled beak jutting out and the side of the channel tubeshaped inwards, through which the tongue can shoot out; moreover it is prickly all round, with about seven spikes forming a ring, which are not found in the whelk, though both shells have as many rings as they are years old. The trumpet-shell clings only to rocks and can be gathered round crags.

Another name used for the purple is 'pelagia.' There are several kinds, distinguished by food and the ground they live on. The mud-purple feeds on rotting slime and the seaweedpurple on seaweed, both being of a very common quality. A better kind is the reef-purple, collected on the reefs of the sea, though this also is lighter and softer as well. The pebblepurple is named after a pebble in the sea, and is remarkably suitable for purple dyes; and far the best for these is the melting-purple, that is, one fed on a varying kind of mud. Purples are taken in a sort of little lobster-pot of fine ply thrown into deep water. These contain bait, cockles that close with a snap, as we observe that mussels do. These when halfkilled but put back into the sea gape greedily as they revive and attract the purples, which go for them with outstretched tongues. But the cockles when pricked by their spike shut up and nip the creatures nibbling them. So the purples hang suspended because of their greed and are lifted out of the water.

62. It is most profitable for them to be taken after the rising of the dog-star or before springtime, since when they have waxed themselves over with slime, they have their juices fluid. But this fact is not known to the dyers' factories, although it is of primary importance. Subsequently the vein of which we spoke is removed, and to this salt has to be added, about a pint for every hundred pounds; three days is the proper time for it to be steeped (as the fresher the salt the stronger it is). and it should be heated in a leaden pot, and with 50 lbs. of dye to every six gallons of water kept at a uniform and moderate temperature by a pipe brought from a furnace some way off. This will cause it gradually to deposit the portions of flesh which are bound to have adhered to the veins, and after about nine days the cauldron is strained and a fleece that has been washed clean is dipped for a trial, and the liquid is heated up until fair confidence is achieved. A ruddy colour is inferior to a blackish one. The fleece is allowed to soak for five hours and after it has been carded is clipped again, until it soaks up all the juice. The whelk by itself is not approved of, as it does not make a fast dye: it is blended in a moderate degree with seapurple and it gives to its excessively dark hue that hard and brilliant scarlet which is in demand: when their forces are thus mingled, the one is enlivened, or deadened as the case may be, by the other. The total amount of dye-stuffs required for 1,000 lbs. of fleece is 200 lbs. of whelk and 111 lbs. of seapurple; so is produced that remarkable amethyst colour. For Tyrian purple the wool is first soaked with sea-purple for a preliminary pale dressing, and then completely transformed with whelk dye. Its highest glory consists in the colour of congealed blood, blackish at first glance but gleaming when held up to the light; this is the origin of Homer's phrase, 'blood of purple hue.'

63. I notice that the use of purple at Rome dates from the earliest times, but that Romulus used it only for a cloak; as it is fairly certain that the first of the kings to use the bordered robe and broader purple stripe was Tullus Hostilius, after the conquest of the Etruscans. Cornelius Nepos, who died in the principate of the late lamented Augustus, says: 'In my young days the violet purple dye was the vogue, a pound of which sold at 100 denarii; and not much later the red purple of Taranto. This was followed by the double-dyed Tyrian purple, which it was impossible to buy for 1000 denarii per pound. This was first used in a bordered robe by Publius Lentulus Spinther, curule aedile, but met with disapproval, though who does not use this purple for covering dining-couches now-a-days? Spinther was aedile in the consulship of Cicero, 63 BC. Stuff dipped twice over used at that time to be termed

'double-dyed,' and was regarded as a lavish extravagance, but now almost all the more agreeable purple stuffs are dyed in this way.

64. In a purple-dyed dress the rest of the process is the same except that trumpet-shell dye is not used, and in addition the juice is diluted with water and with human urine in equal quantities; and only half the amount of dye is used. This produces that much admired paleness, avoiding deep colouration, and the more diluted the more the fleeces are stinted.

The prices for dyestuff vary in cheapness with the productivity of the coasts, but those who buy them at an enormous price should know that deep-sea purple nowhere exceeds 50 sesterces and trumpet-shell 100 sesterces per 100 lbs.

65. But every end leads to fresh starts, and men make a sport of spending, and like doubling their sports by combining them and re-adulterating nature's adulterations, for instance staining tortoiseshells, alloying gold with silver to produce amber-metal ware, and adding copper to these to make Corinthian ware. It is not enough to have stolen for a dve the name of a gem, 'sober-stone,' but when finished it is made drunk again with Tyrian dye, so as to produce from the combination an outlandish name and a twofold luxury at one time; and when they have made shell-dye, they think it an improvement for it to pass into Tyrian. Repentance must have discovered this first, the artificer altering a product that he disapproved of; but reason sprang up next, and a defect was turned into a success by marvellous inventions, and a double path pointed out for luxury, so that one colour might be concealed by another, being pronounced to be made sweeter and softer by this process; and also a method to blend minerals, and dye with Tyrian a fabric already dyed with scarlet, to produce colour. The kermes, a red kernel of Galatia as we shall say when dealing with the products of the earth, or else in the neighbourhood of Merida in Lusitania, is most approved. But, to finish off these famous dyes at once, the kernel when a year old has a viscous juice, and also after it is four years old the juice tends to disappear, so that it lacks strength both when fresh and when getting old.

We have amply dealt with the method whereby the beauty of men and women alike believes that it is rendered most abundant.

66. The genus shell-fish also includes the fan-mussel. It occurs in marshy places, always in an upright position, and never without a companion which is called the pea-crab, or by others the sea-pen-protector: this is a small shrimp, elsewhere called a crab, its attendant at the feast. The sea-pen opens, presenting the dark inside of its body to the tiny fishes; these at once dart forward, and when their courage has grown by license, they fill up the sea-pen. Her marker having watched for this moment gives her a signal with a gentle nip. She by shutting up kills whatever she has enclosed, and bestows a share on her partner.

67. This makes me all the more surprised that some people have held the view that aquatic animals possess no senses. The torpedo knows her power, and does not herself possess the torpor she inflicts; she hides by plunging into the mud, and snaps up any fish that have received a shock while swimming carelessly above her. No tender morsel is preferred to the liver of this fish. The sea-frog called the angler-fish is equally cunning: it stirs up the mud and puts out the little horns that project under its eyes, drawing them back when little fishes frisk towards them till they come near enough for it to spring upon them. In a similar manner the skate and the turbot while in hiding put out their fins and wave them about to look like worms, and so also do the fish called rays. For the stingray acts as a freebooter, from its hiding place transfixing fish passing by with its sting, which is its weapon; there are proofs of this cunning, because these fish, though the slowest there are, are found with mullet, the swiftest of all fish, in their belly.

The scolopendra, which resembles the land animal called the centipede, when it has swallowed a hook vomits up the whole of its inwards until it succeeds in disgorging it, and then sucks them back again. Sea-foxes on the other hand in a similar emergency gulp down more of the line till they reach its weak part where they may easily gnaw it off. The fish called the catfish more cautiously nibbles at hooks from behind and strips them of the bait without swallowing them.

The sea-ram goes around like a brigand, and now hides in the shadow of the larger vessels riding at anchor and waits in case somebody may be tempted by the pleasure of a swim, now raises its head out of the water and watches for fishermen's boats, and secretly swimming up to them sinks them.

68. For my own part I hold the view that even those creatures which have not got the nature of either animals or plants, but some third nature derived from both, possess sense-perceptionI mean jellyfish and sponges.

Jellyfish roam about and change their place by night. These have the nature of a fleshy leaf, and they feed on flesh. The itch they cause has a biting power, just like that of the land nettle. Consequently this creature draws itself in as stifly as possible and when a little fish swims in front of it spreads out its leaf and enfolding it devours it. In other cases it looks as if it were withering up, and allows itself to be tossed about by the waves like seaweed, and attacks any fish that touch it as they try to scrape away the itch by rubbing against a rock. The same creature by night hunts for scallops and sea-urchins. When it feels a hand approach it, it changes colour and draws itself together. When touched it sends out a burning sting, and if there is a moment's interval hides. It is reported to have mouths in its root and to evacuate its excretions by a narrow tube through its topmost parts.

69. We are informed that there are three kinds of sponge: a thick and very hard and rough one is called goat-thorn sponge, a less thick and softer one loose-sponge, and a thin one of close texture, used for making paintbrushes, Achilles sponge. They all grow on rocks, and feed on shells, fish and mud. These creatures manifestly possess intelligence, because when they are aware of a sponge-gatherer they contract and make it much more difficult to detach them. They do the same when much beaten by the waves. The tiny shells found inside them clearly show that they live by eating food. It is said that in the neighbourhood of Torone they can be fed on these shellfish even after they have been pulled off the rocks, and that fresh sponges grow again on the rocks from the roots left there; also the colour of blood remains on them, especially on the African ones that grow on the sandbanks. Very large but very soft thin sponges grow round Lycia, though those in deep and calm water are softer; the rough kind grows in the Dardanelles, and the close-textured round Cape Malea, Sponges decay in sunny places, and consequently the best are found in deep pools. Live sponges have the same blackish colour as sponges in use have when wet. They do not cling to the rock with a particular part nor with their entire surface, for they have certain empty tubes, about four or five in number, running through them, through which it is believed that they take their food. They also have other tubes, but these are closed at the upper end; and it is understood that there is a sort of thin skin on the under side of their roots. It is established that they live a long time. The worst of all the species of sponge is one called in Greek the dirty sponge, because it cannot be cleaned; it contains large tubes, and the rest of it is of a very close texture.

70. The number of dog-fish specially swarming round sponges beset the men that dive for them with grave danger. These persons also report that a sort of 'cloud' thickens above their headsthis a live creature resembling flatfishpressing them down and preventing them from getting back, and that because of this they have very sharp spikes attached to cords, because the 'clouds' will not withdraw unless stabbed through in this waythis story being the result, as I believe, of darkness and fear; for nobody has ever heard of any such creature in the list of animals as the 'cloud' or 'fog,' which is the name the divers give to this plague. Divers have fierce fights with the dog-fish; these attack their loins and heels and all the white parts of the body. The one safety lies in going for them and frightening them by taking the offensive; for a dog-fish is as much afraid of a man as a man is of it, and so they are on equal terms in deep water. When they come to the surface, then the man is in critical danger, as the policy of taking the offensive is not available while he is trying to get out of the water, and his only safety Is in his comrades. These haul on the rope tied to his shoulders; this, as he carries on the duel, he shakes with his left hand to give a signal of danger, while his right hand grasps his dagger and is occupied in fighting. Most of the time they haul gently, but when he gets near the boat, unless with a quick heave they suddenly snatch him out of the water, they have to look on while he is made away with. And often when divers have already begun to be hauled up they are snatched out of their comrades' hands, unless they have themselves supplemented the aid of those hauling by curling up into a ball. Others of the crew of course thrust out harpoons, but the vast beast is crafty enough to go under the vessel and so carry on the battle in safety. Consequently divers devote their whole attention to keeping a watch against this disaster; the most reliable token of safety is to have seen some flatfish, which are never found where these noxious creatures areon account of which divers call them the holy fish.

71. It must be agreed that creatures enclosed in a flinty shell, such as oysters, have no senses. Many have the same nature as a bush, for instance the sea-cucumber, the sea-lung, the starfish. And to no such an extent is it the case that everything grows in the sea, that even the creatures found in inns in summertimethose that plague us with a quick jump or those that hide chiefly in the hairoccur there, and are often drawn out of the water clustering round the bait; and their irritation is thought to disturb the sleep of fish in the sea at night. Indeed on some kinds of fish these vermin actually breed as parasites; the herring is believed to be one of these.

72. Nor are there wanting dire poisons, as in the sea-hare which in the Indian Ocean infects even by its touch, immediately causing vomiting and laxity of the stomach, and in our own seas the shapeless lump resembling a hare in colour only, whereas the Indian variety is also like a hare in size and in fur, only its fur is harder; and there it is never taken alive. An equally pestiferous creature is the weaver, which wounds

with the sharp point of its dorsal fin. But there is nothing in the world more execrable than the sting projecting above the tail of the stingray which our people call the parsnip-fish; it is five inches long, and kills trees when driven into the root, and penetrates armour like a missile, with the force of steel and with deadly poison.

73. We are not told that the various kinds of fish suffer from endemic diseases, as do all other even wild animals; but that individuals among them are liable to illness is proved by the emaciated condition of some fish contrasted with the extreme fatness of others. of the same kind when caught.

74. The curiosity and wonder of mankind does not allow us to postpone the consideration of these animals' method of reproduction. Fish couple by rubbing their bellies together so quickly as to escape the sight; dolphins and the rest of the large marine species couple in a similar manner, but with rather longer contact. At the coupling season the female fish pursues the male, nudging his belly with her nose, but directly after the eggs are born the males similarly pursue the females and eat their eggs. Copulation is not enough in itself to cause the birth of offspring, unless when the eggs are laid the males swim to and fro sprinkling them with life-giving milk. This is not achieved with all the eggs in so great a multitudeotherwise the seas and marshes would be completely filled, since the uerus of a single fish holds a countless number of eggs.

Fishes' eggs in the sea grow in size, some with extreme rapidity, for instance those of the murena, some a little more slowly. Flat fish not possessing a tail, and sting-ray and tortoises, cover the female in mating, polyps couple by attaching a single feeler to the female's nostrils, the two varieties of cuttle-fish with their tongues, linking their arms together and swimming in opposite directions; they also spawn through the mouth. But polyps couple with their head turned towards the ground, all the other soft fishes with their backs--for instance sea-dogs, and also langoustes and prawns; crabs with their mouth. Frogs cover the female, the male grasping her shoulder-blades with his forefeet and her buttocks with his hind feet. They spawn very small lumps of dark flesh that are called tadpoles, possessing only eyes and a tail; but soon feet are formed by the tail dividing into two hind legs. And strange to say, after six months of life they melt invisibly back into mud, and again in the waters of springtime are reborn what they were before, equally owing to some hidden principle of nature, as it occurs every year. Also mussels and scallops are produced by spontaneous generation in sandy waters; fish with harder shells, like the two varieties of purple-fish, are generated by a sticky juice like saliva, as gnats are by moisture turning sour: the anchovy by sea-foam growing warm when rain gets into it; but fish protected by a flinty covering, like oysters, are generated by rotting mud, or by the foam round ships that stay moored for some time, and especially round stakes fixed in the ground, and timber. It has recently been discovered in ovster-beds that a fertilizing moisture flows out of these fish like milk. Eels rub against rocks and the scrapings come to life; this is their only way of breeding. Different kinds of fish do not mate together, except the skate and the ray, the cross between which is like a ray in front, and bears in Greece a name derived from the names of both parents.

Some creatures are born at a fixed season of the year water species as well as those on land: scallops of and slugs and leeches in the spring; these also pass away at a fixed season. Among fish the wolf-fish and the sardine breed twice a year, and so do all the rock-fish; some breed three times, for instance the herring; carp six times; sea-scorpions and twice, in spring and autumn: of the flat fish only the skate twice, in the autumn and at the setting of the Pleiades; most fish in the three months of April, May and June; the stockfish in the autumn, the aargus, the torpedo and the squalus at the season of the equinox; soft fish in the spring; the cuttlefish in all the monthsits eggs stick together with an inky gum like a bunch of grapes, and the male directs his breath upon them, otherwise they are barren. Polyps mate in winter and lay eggs in spring that cluster in a twisting coil; and they are so prolific that when they are killed the cavity of their head will not hold the multitude of eggs that they carried in it when pregnant. They lay them after seven weeks, many of them perishing because of their number. Langoustes rind the rest of the species with rather thin shells deposit their eggs underneath them and so hatch them; the female polyp now sits on the eggs and now forms a closed cavern with her tentacles intertwined in a lattice. The sepia lays on land among reeds or wherever there is seaweed growing, and hatches after a fortnight. The cuttlefish produces its eggs in deep water clustered together like those of the sepia. The purple-fish, the murex and their kind spawn in spring. Sea-urchins have eggs at the full moons in winter, and snails are born in the winter time

75. The electric ray is found having broods numbering eighty; also it produces exceedingly small eggs inside it, shifting them to another part of the womb and emitting them there; and similarly all the species that we have designated cartilaginous: thus it comes about that these are the only fish kinds that are both viviparous and oviparous. With the catfish alone of all species the male guards the eggs, often for as long as 50 days at a time, to prevent their being eaten by other fish. The females of all the other species spawn in thee days if a male has touched them.

76. The horn-fish or garfish is the only fish so prolific that its matrix is ruptured when it spawns; after spawning the wound grows together, which is said to happen in the case of blindworms also. The sea-mouse digs a trench in the ground to lay its eggs in and covers it again with earth, and a month later digs the earth up again and opens the trench and leads its brood into the water.

77. The red mullet and the sea-perch are said to have wombs. The species called by the Greeks hoop-fish is said to practise self-impregnation. The offspring of all aquatic animals are blind at birth.

78. There has recently been sent to us a remarkable case of longevity in fishes. In Campania not far from Naples, there is a country house named Posilipo; Annaeus Seneca writes that in Caesar's fishponds on this property a fish thrown in by Polio Vedius had died after reaching the age of 60, while two others of the same breed that were of the same age were even then living. The mention of fishponds reminds me to say a little more on this topic before leaving the subject of aquatic animals.

79. Oyster ponds were first invented by Sergius Orata on the Gulf of Baiae, in the time of the orator Lucius Crassus, before the Marsian war his motive was not greed but avarice, and he made a great profit out of his practical ingenuity, as he was the first inventor of shower-bathshe used to fit out country houses in this way and then sell them. He was the first to adjudge the best flavour to Lucrine oystersbecause the same kinds of fish are of better quality In different places, for example wolf-fish in the Tiber between the two bridges, turbot at Ravenna, lamprey in Sicily, sturgeon at Rhodes, and other kinds likewisenot to carry out this census of the larder to its conclusion. The coasts of Britain were not yet in service when Orata used to advertise the fame of the products of the Lago Lucrino; but subsequently it was deemed worth while to send to the end of Italy, to Brindisi, for oysters, and to prevent a quarrel between the two delicacies the plan has lately been devised of feeding away in the Lago Lucrino the hunger caused by the long porterage from Brindisi.

80. In the same period the elder Licinius Murena invented fishponds for all the other sorts of fish, and his example was subsequently followed by the celebrated record of Philip and Hortensius. Lucullus had built a channel that cost more than a country house, by actually cutting through a mountain near Naples and letting in the sea; this was why Pompey the Great used to call him 'Xerxes in Roman dress.' After his decease the fish from this pond sold for 4,000,000 sesterces.

81. The first person to devise a separate pond for lampreys was Gaius Hirrius, who added to the triumphal banquets of Caesar lampreys to the number of 6000as a loan, because he would not exchange them for money or for any other commodity. His less than moderate country estate was sold by its fishponds for 4,000,000 sesterces. Subsequently affection for individual fishes came into fashion. At Baculo in the Baiae district the pleader Hortensius had a fishpond containing a lamprey which he fell so deeply in love with that he is believed to have wept when it expired. At the same country house Drusus's wife Antonia adorned her favourite lamprey with earrings, and its reputation made some people extremely eager to visit Baculo.

82. Ponds for keeping snails were first made by Fulvius Lippinus in the Trachina district a little before the civil war fought with Pompey the Great; indeed he kept the different kinds of snails separate, with different compartments for the white snails that grow in the Rieti territory and for the Illyrian variety distinguished for size, the African for fecundity and the Solitane for breed. Moreover he devised a method of fattening them with new wine boiled down and spelt and other kinds of fodder, so that gastronomy was enriched even by fattened oysters; and according to Marcus Varro this ostentatious science was carried to such lengths

83. Moreover some wonderful kinds of fish are reported by Theophrastus. He says that (1) where the rivers debouch around the water-meadows of Babylon a certain fish stays in caverns that contain springs and goes out from them to feed, walking with its fins by means of a repeated movement of the tail, and guards against being caught by taking refuge in its caves and remaining in them facing towards the opening, and that these fishes' heads resemble a sea-frog's and the rest of its parts a goby's, though the gills are the same as in other fish. (2) In the neighbourhood of Heraclea and Cromna and in many parts of the Black Sea there is one kind that frequents the water at the edge of rivers and makes itself caverns in the ground and lives in these, and also in the shore of tidal rivers when left dry by the tide; and consequently they are only dug up when the movement of their bodies shows that they are alive. (3) In the same neighbourhood of Heraclea at the outflow of the river Lycus fishes are born from eggs left in the mud that seek their fodder by flapping with their little gills,

and this makes them not need moisture, which is the reason why eels also live comparatively long when taken out of the water, while eggs mature in a dry place, for instance tortoise's eggs. (4) In the same region of the Black Sea the fish most frequently caught in the ice is the goby, which is only made to reveal the movement of life by the heat of the saucepan. These accounts indeed, however marvellous, do nevertheless embody a certain principle. The same authority reports that in Paphlagonia earth-fish extremely acceptable for food are dug out of deep trenches in places where there is no overflow from streams; and after himself expressing surprise at their being propagated without coupling, he gives the view that at all events they have a supply of moisture in them similar to that in wellsbut as if fish were found in any wells! Whatever the fact is as to this, it certainly makes the life of moles, an underground animal, less remarkable, unless perhaps these fishes also possess the nature of earth-worms.

84. But credibility is given to all these statements by the flooding of the Nile, with a marvel that surpasses them all: this is that, when the river withdraws its covering, water-mice are found with the work of generative water and earth uncompleted they are already alive in a part of their body, but the most recently formed part of their structure is still of earth.

85. Nor is it proper to omit the stories about the anthias fish that I notice to have won general acceptance. We have mentioned the Swallow Islands, situated off a promontory of Mt. Taurus in the rocky sea of Asia; this fish is frequent there, and is quickly caught, in one variety. A fisherman sails out a certain distance in a small boat, wearing clothes that match the boat in colour, and at the same time for several days running, and throws out bait; but if any alteration whatever be made, the prey suspects a trick and avoids the thing that has frightened it. When this has been done a number of times. at last one anthias is tempted by familiarity to try to get the bait. This one is marked down with careful attention as a foundation for hope and as a decoy for a catch; and it is not difficult to mark it, as for several days only this one ventures to come close. At last it finds others as well, and gradually enlarging its company finally brings shoals too big to count, as by this time all the oldest fish have got used to recognizing the fisherman and snatching the bait out of his hand. Then he throws a hook fixed in the bait a little beyond his fingers, and catches or rather rushes them one by one, snatching them with a short jerk away from the shadow of the boat so that the others may not notice it, while another man in the boat receives the catch in some rags so that no flapping or noise may drive away the others. It pays to know the decoy fish for this purpose, so that he may not be caught, as thenceforward the shoal will swim away. There is a story that a disaffected partner in a fishery lay in wait for the leader fish, which was very well known, and caught it, with malicious intent; Mucianus adds that it was recognized in the market by the partner who was being victimized, and that proceedings for damage were instituted and a verdict given for the prosecution with damages as assessed. Moreover it is said that when these fishes see one of their number hooked they cut the line with the sawlike prickles that they have on their back, while the one held by the line draws it taut so as to enable it to be severed. With the satgus kind however the captive itself rubs the line against the rocks.

85. Besides these eases I observe that authors renowned for their wisdom express surprise at there being a star in the sea: that is the shape of the fish which has rather little, flesh inside it but a rather hard rind outside. They say that this fish contains such fiery heat that it scorches all the things it touches in the sea, and digests all food immediately. I cannot readily say by what experiments this has been ascertained, and I should consider a fact that there is daily opportunity of experiments to be much more worth recording

experiencing to be much more worth recording. 87. The class shellfish includes the piddock, named fingermussel from its resemblance to a human fingernail. It is the nature of these fish to shine in darkness with a bright light when other light is removed, and in proportion to their amount of moisture to glitter both in the mouth of persons masticating them and in their hands, and even on the floor and on their clothes when drops fall from them, making it clear beyond all doubt that their juice possesses a property that we should marvel at even in a solid object.

88. There are also remarkable facts as to their quarrels and their friendship. Violent animosity rages between the mullet and the wolf-fish, and between the conger and the lamprey, which gnaw each other's tails. The langouste is so terrified of the polyp that it dies if it merely sees one near to it, and so does the conger if it sees a langouste; while on the other hand congers tear a polyp to pieces. Nigidius states that the wolffish gnaws at the tail of the mullet, although they are friendly together in certain months, but that all the mullets with their tails amputated in this way continue to live. But on the other hand instances of friendship, in addition to the creatures whose alliance we have mentioned, are the whale and the seamouse: because the whale's eyes are overburdened with the excessively heavy weight of its brows the seamouse swims in front of it and points out the shallows dangerous to its bulky size, so acting as a substitute for eyes.

There will follow an account of the natures of birds.

NATURAL HISTORY BOOK 10

1. The next subject is the Nature of Birds. Of these the largest species, which almost belongs to the class of animals, the ostrich of Africa or Ethiopia, exceeds the height and surpasses the speed of a mounted horseman, its wings being bestowed upon it merely as an assistance in running, but otherwise it is not a flying creature and does not rise from the earth. It has talons resembling a stag's hooves, which it uses as weapons; they are cloven in two, and are useful for grasping stones which when in flight it flings with its feet against its pursuers. Its capacity for digesting the objects that it swallows down indiscriminately is remarkable, but not less so is its stupidity in thinking that it is concealed when it has hidden its neck among bushes, in spite of the great height of the rest of its body. The eggs of the ostrich are extremely remarkable for their size; some people use them as vessels, and the feathers for adorning the crests and helmets of warriors.

2. They say that Ethiopia and the Indies possess birds extremely variegated in colour and indescribable, and that Arabia has one that is famous before all others (though perhaps it is fabulous), the phoenix, the only one in the whole world and hardly ever seen. The story is that it is as large as an eagle, and has a gleam of gold round its neck and all the rest of it is purple, but the tail blue picked out with rosecoloured feathers and the throat picked out with tufts, and a feathered crest adorning its head. The first and the most detailed Roman account of it was given by Manilius, the eminent senator famed for his extreme and varied learning acquired without a teacher: he stated that nobody has ever existed that has seen one feeding, that in Arabia it is sacred to the Sun-god, that it lives 540 years, that when it is growing old it constructs a nest with sprigs of wild cinnamon and frankincense, fills it with scents and lies on it till it dies: that subsequently from its bones and marrow is born first a sort of maggot, and this grows into a chicken, and that this begins by paying due funeral rites to the former bird and carrying the whole nest down to the City of the Sun near Panchaia and depositing it upon an altar there. Manilius also states that the period of the Great Year coincides with the life of this bird. and that the same indications of the seasons and stars return again, and that this begins about noon on the day on which the sun enters the sign of the Ram, and that the year of this period had been 215, as reported by him, in the consulship of Publius Licinius and Gnaeus Cornelius. Cornelius Valerianus reports that a phoenix flew down into Egypt in the consulship of Ouintus Plautius and Sextus Papinius; it was even brought to Rome in the Censorship of the Emperor Claudius, a.u.c. 800 and displayed in the Comitium, a fact attested by the Records, although nobody would doubt that this phoenix was a fabrication.

3. Of the birds known to us the eagle is the most honourable and also the strongest. Of eagles there are six kinds. The one called by the Greeks the black eagle, and also the hare-eagle is smallest in size and of outstanding strength; it is of a blackish colour. It is the only eagle that rears its own young, whereas all the others, as we shall describe, drive them away; and it is the only one that has no scream or cry. Its haunt is in the mountains. To the second kind belongs the white-rump eagle found in towns and in level country; it has a whitish tail. To the third the morphnos, which Homer also calls the dusky eagle, and some the plangos and also the duck-eagle; it is second in size and strength, and it lives in the neighbourhood of lakes. Phemonoe, who was styled Daughter of Apollo, has stated that it possesses teeth, but that it is mute and voiceless; also that it is the darkest of the eagles in colour, and has an exceptionally prominent tail. Boethus also agrees. It has a clever device for breaking tortoiseshells that it has carried off, by dropping them from a height; this accident caused the death of the poet Aeschylus, who was trying to avoid a disaster of this nature that had been foretold by the fates, as the story goes, by trustfully relying on the open sky. Next, the fourth class comprises the hawk-eagle, also called the mountain stork, which resembles a vulture in having very small wings but exceeds it in the size of its other parts, and yet is unwarlike and degenerate, as it allows a crow to flog it. It is always ravenously greedy, and keeps up a plaintive screaming. It is the only eagle that carries away the dead bodies of its prey; all the others after killing alight on the spot. This species causes the fifth kind to be called the' true eagle,' as being the genuine kind and the only pure-bred one; it is of medium size and dull reddish colour, and it is rarely seen. There remains the osprey, which has very keen eyesight, and which hovers at a great height and when it sees a fish in the sea drops on it with a swoop and cleaving the water with its breast catches it. The species that we made the third hunts round marshes for water-birds, which at once dive, till they become drowsy and exhausted when it catches them. The duel is worth watching, the bird making for refuge on the shore, especially if there is a dense reed-bed, and the eagle driving it away from the shore with a blow of its wing; and when it is hunting its quarry in a lake, soaring and showing its shadow to the bird swimming under water away from the shore, so

that the bird turns back again and comes to the surface at a place where it thinks it is least expected. This is the reason why birds swim in flocks, because several are not attacked at the same time, since they blind the enemy by splashing him with their wings. Often even the eagles themselves cannot carry the weight of their catch and are drowned with it. The sea-eagle only compels its still unfledged chicks by beating them to gaze full at the rays of the sun, and if it notices one blinking and with its eves watering flings it out of the nest as a bastard and not true to stock, whereas one whose gaze stands firm against the light it rears. Sea-eagles have no breed of their own but are born from crossbreeding with other eagles; but the offspring of a pair of sea-eagles belongs to the osprey genus, from which spring the smaller vultures, and from these the great vultures which do not breed at all. Some people add a species of eagle which they call the bearded eagle, but which the Tuscans call an ossifrage.

4. The three first and the fifth kinds of eagle have the stone called eagle-stone (named by some gagites) built into their nests, which is useful for many cures, and loses none of its virtue by fire. The stone in question is big with another inside it, which rattles as if in a jar when you shake it. But only those taken from a nest possess the medicinal power referred to. They build their nests in rocks and trees, and lay as many as three eggs at a time, but they shut out two chicks of the brood, and have been seen on occasion to eject even three. They drive out the other chick when they are tired of feeding it: indeed at this period nature has denied food to the parent birds themselves as a precaution, so that the young of all the wild animals should not be plundered; also during those days the birds' talons turn inward, and their feathers grow white from want of food, so that with good reason they hate their own offspring. But the chicks thrown out by these birds are received by the kindred breed, the bearded eagles, who rear them with their own. However the parent bird pursues them even when grown up, and drives them far away, doubtless because they are competitors in the chase. And apart from this a single pair of eagles in order to get enough food requires a large tract of country to hunt over; consequently they mark out districts, and do not poach on their neighbours' preserves. When they have made a catch they do not carry it off at once, but first lay it on the ground, and only fly away with it after first testing its weight. They meet their end not from old age nor sickness but from hunger, as their upper mandible grows to such a size that it is too hooked for them to be able to open it. They get busy and fly in the afternoon, but in the earlier hours of the day they perch quite idle till the market-places fill with a gathering of people. If eagles' feathers have the feathers of any other birds mixed with them, they swallow them up. It is stated that this is the only bird that is never killed by a thunderbolt; this, is why custom has deemed the eagle to be Jupiter's armour-bearer.

5. The eagle was assigned to the Roman legions as their special badge by Gaius Marius in his second consulship. Even previously it had been their first badge, with four others, wolves, minotaurs, horses and boars going in front of the respective ranks; but a few years before the custom had come in of carrying the eagles alone into action, the rest being left behind in camp. Marius discarded them altogether. Theneeforward it was noticed that there was scarcely ever a legion's winter camp without a pair of eagles being in the neighbourhood.

The first and second kinds not only carry off the smaller four-footed animals but actually do battle with stags. The eagle collects a quantity of dust by rolling in it, and perching on the stag's horns sakes it off into its eyes, striking its head with its wings, until it brings it down on to the rocks. Nor is it content with one foe: it has a fierer battle with a great serpent, and one that is of much more doubtful issue, even though it is in the air. The serpent with mischievous greed tries to get the eagle's eggs; consequently the eagle carries it off wherever seen. The serpent fetters its wings by twining itself round them in manifold coils so closely that it falls to the ground itself with the snake.

6. At the city of Sestos the fame of an eagle is celebrated, the story being that it was reared by a maiden and that it repaid its gratitude by bringing to her first birds and soon afterwards big game, and when finally she died it threw itself upon her lighted pyre and was burnt with her. On account of this the inhabitants made what is called a heroon in that place, which is named the Shrine of Jupiter and the Maiden, because the bird is assigned to that deity.

7. Of vultures the black are the strongest. No one has ever reached their nests, and consequently there have actually been persons who have thought that they Ily here from the opposite side of the globe. This is a mistake: they make their nests on extremely lofty crags. Their chicks indeed are often seen, usually in pairs. The most learned augur of our age, Umbricius, states that they lay thirteen eggs, but use one of them for cleaning the remaining eggs and the nest and then throw it away; but that three days before they lay the eggs they fly to some place where there will be dead bodies.

8. There is great question among the Roman augurs about the sanqualis and the immnsulus. Some think that the

immusulus is the chick of the vulture and the sanqualis of the bearded vulture. Masurius says that the sanqualis is a bearded vulture and the immusulus an eagle's chick before its tail turns white. Some persons have asserted that they have not been seen at Rome since the time of the augur Mucius, but for my own part I think it more probable that in the general slackness that prevails they have not been recognized.

9. Of hawks we find sixteen kinds, and among these the aegithus, which when lame in one foot is of very fortunate omen for marriage contracts and for property in cattle, and the triorchis, named from the number of its testicles, the bird to which Phemonoe gave primacy among auguries. The Roman name for it is buteo, which is also the surname of a family, assumed because one perched on an admiral's ship with good omen. The Greeks give the name of merlin to the only species that appears at every season, whereas all the others go away in winter. The varieties of hawks are distinguished by their appetite for food: some only snatch a bird off the pound, others only one fluttering round a tree, others one that perches high in the branches, others one flying in the open. Consequently even the doves know the risks that they run from hawks, and when They see one They alight, or else fly upward, safeguarding themselves by going counter to the hawk's nature. The hawks of the whole of Massaesylia lay their eggs on the ground in Cerne, an island of Africa in the Ocean, and they do not breed elsewhere, as they are accustomed to the natives of that island.

10. In the district of Thrace inland from Amphipolis men and hawks have a sort of partnership for fowling: the men put up the birds from woods and reed-beds and the hawks flying overhead drive them down again; the fowlers share the bag with the hawks. It is reported that when the birds have been put up the hawks intercept them in the air, and when it is time for a catch invite the sportsmen to take the opportunity by their screaming and their way of flying. Wolf-fish at the Maeotic Marsh act somewhat in the same way, for unless they get their share from fishermen they tear their nets when spread.

Hawks do not eat the hearts of birds. The night-hawk is called cybindis; it is rare even in forests, and cannot see very well in the daytime. It wages war to the death with the eagle, and they are often taken clinging together in each other's clutches.

11. The cuckoo seems to be made by changing its shape out of a hawk at a certain season of the year, as the rest of the hawks do not appear then, except on a very few days, and the cuckoo itself also after being seen for a moderate period of the summer is not observed afterwards. But the cuckoo is alone among the hawks in not having crooked talons, and also it is not like the other hawks in the head or in anything else but colour: it rather has the general appearance of the pigeon. Moreover a hawk will eat a cuckoo, if ever both have appeared at the same time: the cuckoo is the only one of all the birds that is killed by its own kind. And it also changes its voice. It comes out in the spring and goes into lung at the rising of the dog-star, between which dates it lays its eggs in the nests of other birds, usually wood-pigeons, for the most part one egg at a time, as does no other bird; it seldom lays two. Its reason for foisting its chicks on other birds is supposed to be that it knows itself to be hated by the whole of the birds, for even the very small birds attack it; consequently it thinks that a progeny will not be secured for its race unless it has escaped notice, for which reason it makes no nest; it is a timid creature in general. Therefore the brooding hen in the nest thus cuckolded rears the changeling. The young cuckoo being by nature greedy snatches the bits of food away from the rest of the chicks, and so gets fat and attracts the mother bird to itself by its sleek appearance. She delights in its beauty and admires herself for having borne such a child, while in comparison with it she convicts her own chicks of not belonging to her, and lets them be eaten up even under her own eyes, until finally the cuckoo, now able to fly, seizes the mother bird herself as well. At this stage no sort of bird will compare with a young cuckoo for sayoury flayour

12. Kites belong to the same genus as hawks but differ in size. It has been noticed in regard to this species. That though a most rapacious bird and always hungry it never steals any delible from the oblations at funerals nor from the altar at Olympia and not even out of the hands of the people bringing the offsprings except with a gloomy portent for the slaves performing the sacrifice. Also it seems that this bird by its manipulation of its tail taught the art of steersmanship, nature demonstrating in the sky what was required in the deep. Kites themselves also are not seen in the winter months, though not departing before the swallow; it is reported however that they suffer from gout even from midsummer onward.

13. The primary distinction between birds is established especially by the feet; for either they have hooked talons or claws or they are in the web-footed class like geese and water-fowl generally. If they have hooked talons they live for the most part only on flesh:

14. though crows eat other food as well, as if a nut is so hard that it resists their beak they fly up aloft and drop it two

or more times on to rocks or roof-tiles, till it is cracked and they can break it open. The bird itself has a persistent croak that is unlucky, although some people speak well of it. It is noticed that from the rising of Arcturus to the arrival of the swallows it is rarely seen in groves and temples of Minerva and never at all elsewhere, as is the case at Athens; it is most unlucky at its breeding season, that is, after midsummer. Moreover this bird alone continues feeding its chicks for some time even when they can fly:

15. whereas all the other birds of the same class drive their chicks out of the nests and compel them to fly, as also do ravens. These not only feed on flesh themselves too, but also drive away their chicks when strong to a considerable distance. Consequently in small villages there are not more than two pairs of ravens, and in fact in the neighbourhood of Crannon in Thessaly there is one pair permanently in each place; the parents retire to make room for their offspring.

There are certain points of difference between this bird and the one mentioned above. Ravens breed before midsummer, also they have 60 days of ill-health, principally owing to thirst, before the figs ripen in the autumn; whereas the crow is seized with sickness from that day onward.

Ravens produce broods of five at most. There is a popular belief that they lay eggs, or else mate, with the beak (and that consequently if women with child eat a raven's egg they bear the infant through the mouth, and that altogether they have a difficult delivery if raven's eggs are brought into the house); but Aristotle says that this is not true of the raven, any more indeed than it is of the ibis in Egypt, but that the billing in question (which is often noticed) is a form of kissing, like that which takes place between pigeons. Ravens seem to be the only birds that have an understanding of the meanings that they convey in auspices; for when the guests of Medus were murdered, all the ravens in the Peloponnese and Attica flew away. It is a specially bad omen when they gulp down their croak as if they were choking.

16. Night birds also have hooked talons, for instance the little owl, the eagle-owl and the screech-owl. All of these are dim-sighted in the daytime. The eagle-owl is a funereal bird, and is regarded as an extremely bad omen, especially at public auspices; it inhabits deserts and places that are not merely unfrequented but terrifying and inaccessible: a weird creature of the night, its cry is not a musical note but a scream. Consequently when seen in cities or by daylight in any circumstances it is a direful portent; but I know several cases of its having perched on the houses of private persons without fatal consequences. It never flies in the direction where it wants to go, but travels slantwise out of its course. In the consulship of Sextus Palpellius Hister and Lucius Pedanius an eagle-owl entered the very shrine of the Capitol, on account of which a purification of the city was held on March 7th in that vear.

17. There is also a bird of ill-omen called the fire-bird, on account of which we find in the annals that the city has often had a ritual purification, for instance in the consulship of Lucius Cassius and Gaius Marius, in which year the appearance of an eagle-owl also occasioned a purification. What this bird was I cannot discover, and it is not recorded. Some persons give this interpretation, that the fire-bird was any bird that was seen carrying a coal from an altar or altartable; others call it a 'spinturnix,' but I have not found anybody who professes to know what particular species of bird that is. I also notice that the bird named by the ancients 'clivia' is unidentifiedsome call it 'screech-owl,' Labeo 'warning owl'; and moreover a bird is cited in Nigidius that breaks eagles' eggs. There are besides a number of kinds described in Tuscan lore that have not been seen for generations, though it is surprising that they should have now become extinct when even kinds that are ravaged by man's greed continue plentiful.

18. On the subject of the auguries of foreign races the writings of an author named Hylas are deemed to be the most learned. He states that the night-owl, eagle-owl, woodpecker, trygona and raven come out of the egg tail first, because the eggs axe turned the wrong way up by the weight of the heads and present the hinder part of the chicks' bodies to the mother to cherish.

19. Night-owls wage a crafty battle against other birds. When surrounded by a crowd that outnumbers them they lie on their backs and defend themselves with their feet, and bunching themselves up close are entirely protected by their beak and claws. Through a kind of natural alliance the hawk comes to their aid and takes part in the war. Nigidius relates that night-owls hibernate for 60 days every winter, and that they have nine cries.

20. There are also small birds with hooked claws, for instance the variety of woodpeckers called Birds of Mars that are important in taking auguries. In this class are the tree-hollowing woodpeckers that climb nearly straight upright in the manner of cats, hut also the others that cling upside down, which know by the sound of the bark when they strike it that there is folder underneath it. They are the only birds that rear their chicks in holes. There is a common belief that when they drived by a shepherd the birds by

applying a kind of grass make them slip out again. Trebius states that if you drive a nail or wedge with as much force as you like into a tree in which a woodpecker has a nest, when the bird perches on it it at once springs out again with a creak of the tree. Woodpeckers themselves have been of the first importance among auguries in Latium from the time of the king a who gave his name to this bird. One presage of theirs I cannot pass over. When Aelius Tubero, City Praetor, was giving judgements from the bench in the forum, a woodpecker perched on his head so fearlessly that he was able to catch it in his hand. In reply to enquiry the seers declared that disaster was portended to the empire if the bird were released, but to the praetor if it were killed. Tubero however at once tore the bird in pieces; and not long afterwards he fulfilled the portent.

21. Many birds in this class feed also on acorns and fruit, but those that eat only flesh do not drink, excepting the kite, and for a kite to drink counts in itself as a direful augury. The birds having talons never live in flocks, and each hunts for itself. But they almost all except the night-birds among them fly high, and the bigger ones higher. All have large wings and a small body. They walk with difficulty. They rarely perch on rocks, as the curve of their talons prohibits this.

22. Now let us speak about the second class, which is divided into two kinds, songbirds and plumage-birds. The former kind are distinguished by their song and the latter by their size; so the latter shall come first in order also, and among them before all the rest will come the peacock class. both because of its beauty and because of its consciousness of and pride in it. When praised it spreads out its jewelled colours directly facing the sun, because in that way they gleam more brilliantly; and at the same time by curving its tail like a shell it contrives as it were reflexions of shadow for the rest of its colours, which actually shine more brightly in the dark, and it draws together into a cluster all the eyes of its feathers, as it delights in having them looked at. Moreover when it moults its tail feathers every year with the fall of the leaves, it seeks in shame and sorrow for a place of concealment until others are born again with the spring flowers. It lives for 25 years, but it begins to shed its colours at the age of three. The authorities relate that this creature is not only ostentatious but also spiteful, just as the goose is said to be modest--since some writers have added these characteristics also in that species, though I do not accept them.

23. The first person at Rome to kill a peacock for the table was the orator Hortensius, at the inaugural banquet of his priesthood. Fattening peacocks was first instituted about the time of the last pirate war by Marcus Aufidius Lurco, and he made 60,000 sesterces profit from this trade.

24. Nearly equally proud and self-conscious are also our Roman night-watchmen, a breed designed by nature for the purpose of awakening mortals for their labours and interrupting sleep. They are skilled astronomers, and they mark every three-hour period in the daytime with song, go to bed with the sun, and at the fourth camp-watch recall us to our business and our labour and do not allow the sunrise to creep upon us unawares, hut herald the coming day with song while they herald that song itself with a flapping of their wings against their sides. They lord it over their own race, and exercise royal sway in whatever household they live. This sovereignty they win by duelling with one another, seeming to understand that weapons grow upon their legs for this purpose, and often the fight only ends when they die together. If they win the palm, they at once sing a song of victory and proclaim themselves the champions, while the one defeated hides in silence and with difficulty endures servitude. Yet even the common herd struts no less proudly, with uplifted neck and combs held high, and alone of birds casts frequent glances at the sky, also rearing its curved tail aloft. Consequently even the lion, the noblest of wild animals, is afraid of the cock Moreover some cocks are born solely for constant wars and battlesby which they have even conferred fame on their native places, Rhodes or Tanagra; the fighting cocks of Melos and Chalcidice have been awarded second honoursso that the Roman purple confers its high honour on a bird full worthy of it. These are the birds that give the Most-Favourable Omens: these birds daily control our officers of state, and shut or open to them their own homes; these send forward or hold back the Roman rods of office, and order or forbid battle formation, being the auspices of all our victories won all over the world; these hold supreme empire over the empire of the world, being as acceptable to the gods with even their inward parts and vitals as are the costliest victims. Even their later and their evening songs contain portents; for by crowing all the nights long they presaged to the Boeotians that famous victory against the Spartans, conjecture thus interpreting the sign because this bird when conquered does not crow.

25. Cocks when gelt stop crowing; the operation is performed in two waysby searing with a glowing iron either the loins or the bottom parts of the legs, and then smearing the wound with potter's clay. This operation makes them easier to fatten. At Pergamum every year a public show is given of cocks fighting like gladiators. It is found in the Annals that in the consulship Marcus Lepidus and Quintus Catulus, at the country house of Oalerius in the Rimini

district, a farmyard cock spokethe only occasion, so far as I know, on which this has occurred.

26. The goose also keeps a careful watch, as is evidenced by its defence of the Capitol during the time when our fortunes were being betrayed by the silence of the dogs; for which reason food for the geese is one of the first contracts arranged by the censors. Moreover there is the story of the goose at Aegium that fell in love with the supremely beautiful boy Amphilochus of Olenus, and also the goose that loved Glauce, the girl that played the harp for King Ptolemy, whom at the same time also a ram is said to have fallen in love with. These birds may possibly be thought also to possess the power of understanding wisdom: thus there is a story that a goose attached itself continually as a companion to the philosopher Lacydes, never leaving his side by night or day, either in public or at the baths.

27. Our countrymen are wiser, who know the goose by the excellence of its liver. Stuffing the bird with food makes the liver grow to a great size, and also when it has been removed it is made larger by being soaked in milk sweetened with honey. Not without reason is it a matter of enquiry who was the discoverer of so great a boonwas it Scipio Metellus the consular, or his contemporary Marcus Seius, Knight of Rome? But it is an accepted fact that Messalinus Cotta, son of the orator Messala, invented the recipe for taking from geese the soles of the feet and grilling them and pickling them in dishes with the combs of domestic cocks; for I will award the palm scrupulously to each man's culinary achievement. A remarkable feat in the case of this bird is its coming on foot all the way to Rome from the Morini in Gaul: the geese that get tired are advanced to the front rank, and so all the rest drive them on by instinctively pressing forward in their rear.

White geese yield a second profit in their feathers. In some places they are plucked twice a year, and clothe themselves again with a feather coat. The plumage closest to the body is softer, and that from Germany is most esteemed. The geese there are a bright white, but smaller; the German word for this bird is Gans; the price of their feathers is five-command of auxiliary troops frequently get into pence per pound. And owing to this officers in trouble for having sent whole cohorts away from outpost sentry duty to capture these fowls; and luxury has advanced to such a pitch that now not even the male neck can endure to be without goose-feather bedding.

28. The part of Syria called Commagene has made another discovery, goose-fat mixed with cinnamon in a bronze bowl, covered with a quantity of snow and steeped in the icy mixture, to supply the famous medicine that is called after the tribe Commagenum.

29. To the goose kind belong the sheldrake and the barnacle-goose, the latter the most sumptuous feast that Britain knows; both are rather smaller than the goose. The black grouse also makes a fine show with its gloss and its absolute blackness, with a touch of bright scarlet above the eyes. Another variety of these exceeds the size of vultures and also reproduces their colour, nor is there any bird except the ostrich that attains a greater weight of body, growing to such a size that it is actually caught motionless on the ground. They are a product of the Alps and the northern region. When kept in fishponds they lose their flavour, and obstinately hold their breath till they die. Next to these are the birds that Spain calls tardae and Greece otides, which are condemned as an article of diet, because when the marrow is drained out of their bones a disgusting smell at once follows.

30. The race of Pygmies have a cessation of hostilities on the departure of the cranes that, as we have said, carry on war with them. It is a vast distance, if one calculates it, over which they come from the eastern sea. They agree together when to start, and they fly high so as to see their route in front of them; they choose a leader to follow, and have some of their number stationed in turns at the end of the line to shout orders and keep the flock together with their cries. At night time they have sentries who hold a stone in their claws, which if drowsiness makes them drop it falls and convicts them of slackness, while the rest sleep with their head tucked under their wing, standing on either foot by turns; but the leader keeps a lookout with neck erect and gives warning. (The same birds when tamed are fond of play, and execute certain circles in a graceful swoop, even one bird at a time). It is certain that when they are going to fly across the Black Sea they first of all make for the straits between the two promontories of Ramsbrow and Carambis, and proceed to ballast themselves with sand; and that when they have crossed the middle of the sea they throw away the pebbles out of their claws and, when they have reached the mainland, the sand out of their throats as well. Cornelius Nepos, who died in the principate of the late lamented Augustus, when he wrote that the practice of fattening thrushes was introduced a little before his time, added that storks were more in favour than cranes, although the latter bird is now one of those most in request, whereas nobody will touch the former.

31. Where exactly storks come from or where they go to has not hitherto been ascertained. There is no doubt that they come from a distance, in the same manner as do cranes, the former being winter visitors and the latter arriving in summer.

Copyright © 2018 by Lord Henfield, Guildford Scientific Press PAGE 3482 When about to depart they assemble at fixed places, and forming a company, so as to prevent any of their class being left behind (unless one captured and in slavery), they withdraw as if at a date fixed in advance by law. No one has seen a band of storks departing, although it is quite clear that they are going to depart, nor do we see them arrive, but only see that they have arrived; both arrival and departure take place in the night-time, and although they fly to and fro across the country, it is thought that they have never arrived anywhere except by night. There is a place in Asia called Snakesdorp with a wide expanse of plains where cranes meet in assembly to hold a palaver, and the one that arrives last they set upon with their claws, and so they depart; it. has been noticed that they have not frequently been seen there after the first fortnight of August. Some persons declare that storks have no tongue. They are held in such high esteem for destroying snakes that in Thessaly to kill them was a capital crime, for which the legal penalty was the same as for homicide.

32. Geese and swans also migrate on a similar principle, but the flight of these is seen. They travel in a pointed formation like fast galleys, so cleaving the air more easily than if they drove at it with a straight front; while in the rear the flight stretches out in a gradually widening wedge, and presents a broad surface to the drive of a following breeze. They place their necks on the birds in front of them, and when the leaders are tired they receive them to the rear. (Storks return to the same nest. They nourish their parents' old age in their turn.) A story is told about the mournful song of swans at their deatha false story as I judge on the strength of a certain number of experiences. Swans are cannibals, and eat one another's flesh.

33. But this migration of birds of passage over seas and lands does not allow us to postpone the smaller breeds as well that have a similar nature. For however much the size and strength of body of the kinds above mentioned may appear to invite them to travel, the quails always actually arrive before the cranes, though the quail is a small bird and when it has come to us remains on the ground more than it soars aloft; but they too get here by flying in the same way as the cranes; not without danger to seafarers when they have come near to land: for they often perch on the sails, and they always do this at night, and sink the vessels. Their route follows definite resting places. They do not fly in a south wind, doubtless because it is damp and rather heavy, yet they desire to be carded by the breeze, because of the weight of their bodies and their small strength (this is the reason for that mournful cry they give while flying, which is wrung from them by fatigue); consequently they fly mostly in a north wind, a landrail leading the way. The first quail approaching land is seized by a hawk; from the place where this happens they always return and try to get an escort, and the tongue-bird, eared-owl and ortolan are persuaded to make the journey with them. The tongue-bird takes its name from the very long tongue that it puts out of its beak. At the start the charm of travelling lures this bird to sail on eagerly, but in the course of the flight repentance comes to it, no doubt with the fatigue; but it does not like to return unaccompanied, and it goes on following, though never for more than one dayat the next resting place it deserts. But day after day the company find another one, left behind in a similar manner the year before. The ortolan is more persevering, and hurries on actually to complete the journey to the lands which they are seeking; consequently it rouses up the birds in the night and reminds them of their journey. The eared owl is smaller than the eagle-owl and larger than night-owls; it has projecting feathery ears, whence its namesome give it the Latin name 'axio'; moreover it is a bird that copies other kinds and is a hanger-on, and it performs a kind of dance. Like the night-owl it is caught without difficulty if one goes round it while its attention is fixed on somebody else. If a wind blowing against them begins to hold up a flight of these birds, they pick up little stones as ballast or fill their throat with sand to steady their flight. Quails are very fond of eating poison seed, on account of which our tables have condemned them; and moreover it is customary to spit at the sight of them as a charm against epilepsy, to which they arc the only living creatures that are liable besides man.

34. Swallows, the only flesh-eating bird among those that have not hooked talons, also migrate in the winter months; but they only retire to places near at hand, making for the sunny gulleys in the mountains, and they have before now been found there moulted and bare of feathers. It is said that they do not enter under the roofs of Thebes, because that city has been so often captured, nor at Bizye in Thrace on account of the crimes of Tereus. A man of knightly rank at Volterra, Caecina, who owned a racing four-in-hand, used to catch wallows and take them with him to Rome and despatch them to take the news of a win to his friends, as they returned to the same nest; they had the winning colour painted on them. Also Fabius Pictor records in his Annals that when a Roman garrison was besieged by the Ligurians a swallow taken from her nestlings was brought to him for him to indicate by knots made in a thread tied to its foot how many days later help would arrive and a sortie must be made.

35. Blackbirds, thrushes and starlings also migrate in a similar way to neighbouring districts; but these do not moult their plumage, and do not go into hiding, being often seen in the places where they forage for winter food. Consequently in Germany thrushes are most often seen in winter. The turtledove goes into hiding in a truer sense, and moults its feathers. Woodpigeons also go into retreat, though in their case also it is not certain exactly where. It is a peculiarity of the starling kind that they fly in flocks and wheel round in a sort of circular ball, all making towards the centre of the flock. The swallow is the only bird that has an extremely swift and swerving flight, owing to which it is also not liable to capture by the other kinds of birds. Also the swallow is the only bird that only feeds when on the wing.

36. There is a great difference in the seasons of birds; some stay all the year round, e.g. pigeons, some for six months, e.g. swallows, some for three months, e.g. thrushes and turtledoves and those that migrate when they have reared their brood, such as woodbeckers and hoopoes.

37. Some authorities state that every year birds fly from Ethiopia to Troy and have a fight at Memnon's tomb, and consequently they call them 'Memnon's daughters.' Cremutius records having discovered that every four years they do the same things in Ethiopia round the royal palace of Memnon.

38. The meleagridesa in Boeotia fight in a similar manner; this is a kind of hen belonging to Africa, hump-backed and with speckled plumage. This is the latest of the migratory birds admitted to the menu, because of its unpleasant pungent flavour; but the Tomb of Meleager has made it famous.

39. There is a species called birds of Seleucis for whose arrival prayers are offered to Jupiter by the migranta, inhabitants of Mount Cadmus when locusts destroy their crops; it is not known where they come from, nor where they go to when they depart, and they are never seen except when their protection is needed.

40. Also the people of Egypt invoke their ibis to guard against the arrival of snakes, and those of Ellis invoke the god Myiacores when a swarm of flies brings plague, the flies dying as soon as a sacrifice to this god has been performed.

41. But in the matter of the withdrawal of birds, it is stated that even night-owls go into retreat for a few days. It is said that this kind does not exist in the island of Crete and even that if one is imported there it dies off. For this also is a remarkable point of variety established by nature: to various places she denies various species of animals as well as of crops and shrubs. For those animals not to be born there is in the ordinary course of things, but their dving off when imported there is remarkable. What is the factor adverse to the health of a single genus that is involved, or what is the jealousy of nature that is indicated? Or what frontiers are prescribed for birds? Rhodes does not possess the eagle; Italy north of the Po gives the name of Como to a lake near the Alps graced with a wooded tract to which storks do not come: and similarly jays and jackdawsa bird whose unique fondness for stealing especially silver and gold is remarkablethough swarming in enormous numbers in the adjacent region of the Insubrians, do not come within eight miles of Lake Como. It is said that Mars's woodpecker is not found in the district of Taranto. The kinds of pie called chequered pies and distinguished for their long tail, though hitherto rare, have lately begun to be seen between the Apennines and Rome; this bird has the peculiarity of moulting its feathers yearly at the time when the turnip is sown. Partridges do not fly across the frontier of Boeotia into Attica; nor does any bird fly across the temple dedicated to Achilles on the island of the Black Sea where he is buried. In the district of Fidenae near Rome storks do not hatch chicks or make nests. But a quantity of pigeons every year fly from the sea to the district of Volterra. Neither flies nor dogs enter the temple of Hercules in the Cattle-market at Rome. There are many similar facts besides, which I am continually careful to omit in my account of the several kinds, to avoid being wearisomefor example Theophrastus states that even pigeons and peacocks and ravens are not indigenous in Asia, nor croaking frogs in Cyrenaica.

42. There is another remarkable fact about songbirds; they usually change their colour and note with the season, and suddenly become differentwhich among the larger class of birds only cranes do, for these grow black in old age. The blackbird changes from black to red; and it sings in the summer, and chirps in winter, but at midsummer is silent; also the beak of yearling blackbirds, at all events the cocks, is turned to ivory colour. Thrushes are of a speckled colour round the neck in summer but self-coloured in winter.

43. Nightingales pour out a ceaseless gush of song for fifteen days and nights on end when the buds of the leaves are swellinga bird not in the lowest rank remarkable. In the first place there is so loud a voice and so persistent a supply of breath in such a tiny little body; then there is the consummate knowledge of music in a single bird: the sound is given out with modulations, and now is drawn out into a long note with one continuous breath, now varied by managing the breath, now made staccato by checking it, or linked together

by prolonging it, or carried on by holding it back; or it is suddenly lowered, and at times sinks into a mere murmur. loud, low, a bass, treble, with trills, with long notes, modulated when this seems goodsoprano, mezzo, baritone; and briefly all the devices in that tiny throat which human science has devised with all the elaborate mechanism of the flute, so that there can be no doubt that this sweetness was foretold by a convincing omen when it made music on the lips of the infant Stesichorus. And that no one may doubt its being a matter of science, the birds have several songs each, and not all the same but every bird songs of its own. They compete with one another, and there is clearly an animated rivalry between them; the loser often ends her life by dying, her breath giving out before her song. Other younger birds practise their music, and are given verses to imitate; the pupil listens with close attention and repeats the phrase, and the two keep silence by turns: we notice improvement in the one under instruction and a sort of criticism on the part of the instructress.

Consequently they fetch the prices that are given for slaves, and indeed larger prices than were paid for armour-bearers in old days. I know of one bird, a white one it is true, which is nearly unprecedented, that was sold for 600,000 sesterces to be given as a present to the emperor Claudius's consort Agrippina. Frequent cases have been seen before now of nightingales that have begun to sing when ordered, and have sung in answer to an organ, as there have been found persons who could reproduce the birds' song with an indistinguishable resemblance by putting water into slanting reeds and breathing into the holes or by applying some slight check with the tongue. But these exceptional and artistic trills after a fortnight gradually cease, though not in such a way that the birds could be said to be tired out or to have had enough of singing; and later on when the heat has increased their note becomes entirely different, with no modulations or variations. Their colour also changes, and finally in winter the bird itself is not seen. Their tongues do not end in a point like those of all other birds. They lay in early spring, six eggs at most

44. It is otherwise with the fig-pecker, as it changes its shape and colour at the same time; it has this name in the autumn, but afterwards is called the blackcap. Similarly also the bird known as erithacus in winter is called redstart in summer.

The hoopoe also changes its appearance, as the poet Aeschylus records; it is moreover a foul-feeding bird, noticeable for its flexible crest, which it draws together and raises up along the whole length of its head.

45. The wheatear indeed actually has fixed days of retirement: it goes into hiding at the rising of the dog-star and comes out after its setting, doing both on the actual days, which is surprising. Also the golden oriole, which is yellow all over, is not seen in winter but comes out about midsummer. Blackbirds are born white at Cyllene in Arcadia, but nowhere else. The ibis is black only in the neighbourhood of Pelusium, being white in all other places.

46. Songbirds apart from some exceptions do not ordinarily breed before the spring equinox or after the autumn one; and their eggs laid before midsummer are doubtful, but those after midsummer are fertile.

47. Kingfishers are especially remarkable for this: the seas and those who sail them know the days when they breed. The bird itself is a little larger than a sparrow, sea-blue in colour and reddish only on the underside, blended with white feathers in the neck, with a long slender beak? There is another kind of kingfisher different in size and note; this smaller kind sings in beds of rushes. A kingfisher is very rarely seen, and only at the setting of the Pleiades and about midsummer and midwinter, when it occasionally flies round a ship and at once goes away to its retreat. They breed at midwinter, on what are called 'the kingfisher days' during which the sea is calm and navigable, especially in the neighbourhood of Sicily. They make their nests a week before the shortest day, and lay a week after it. Their nests are admired for their shape, that of a ball slightly projecting with a very narrow mouth, resembling very large sponges; they cannot be cut with a knife, but break at a strong blow, like dry sea-foam; and it cannot be discovered of what are constructed: people think they are made out of the spines of fishes' prickles, for the birds live on fish. They also go up rivers. They lay five eggs at a time.

48. Gulls nest on rocks, divers also in trees. They lay at most three eggs at a time, sea-mews laying in summer and divers at the beginning of spring.

49. The conformation of the kingfisher's nest reminds one of the skill of all the other birds as well; and the ingenuity of birds is in no other department, more remarkable. Swallows build with clay and strengthen the nest with straw; if ever there is a lack of clay, they wet their wings with a quantity of water and sprinkle it on the dust. The nest itself, however, they carpet with soft feathers and tufts of wool, to warm the eggs and also to prevent it from being hard for the infant chicks. They dole out food in turns among their offspring with extreme fairness. They remove the chicks' droppings with remarkable cleanliness, and teach the older ones to turn round and relieve themselves outside of the nest. There is another kind of swallow that frequents the country and the fields, which seldom nests on houses, and which makes its nest of a different shape though of the same materialentirely turned upward, with orifices projecting to a narrow opening and a capacious interior, and adapted with remarkable skill both to conceal the chicks and to give them a soft bed to lie on. In Egypt, at the Heracleotic Mouth of the Nile, they block the outflow of the river with an irremovable mole of contiguous nests almost two hundred yards long, a thing that could not be achieved by human labour. Also in Egypt near the town of Coptos there is an island sacred to Isis which they fortify with a structure to prevent its being destroyed by the same river, strengthening its point with chaff and straw when the spring days begin, going on for three days all through the nights with such industry that it is agreed that many birds actually die at the work; and this spell of duty always comes round again for them with the returning year. There is a third kind of swallows a that make holes in banks and so construct their nests in the ground. (Their chicks when burnt to ashes are a medicine for a deadly throat malady and many other diseases of the human body.) These birds do not build proper nests, and if a rise of the river threatens to reach their holes, they migrate many days in advance.

50. There is a species of titmouse that makes its nest of dry moss finished off in such a perfect ball that its entrance cannot be found. The bird called the thistle-finch weaves its nest out of flax in the same shape. One of the woodpeckers hangs by a twig at the very end of the boughs, like a ladle on a peg, so that no four-footed animal can get to it. It is indeed asserted that the witwall purposely takes its sleep while hanging suspended by the feet, because it hopes thus to be safer. Again, it is a common practice of them all carefully to choose a flooring of branches to support their nest, and to vault it over against the rain or roof it with a penthouse of thick foliage. In Arabiad a bird called cinnamolgus makes a nest of cinnamon twigs; the natives bring these birds down with arrows weighted with lead, to use them for trade. In Scythia a bird of the size of a bustard lays two eggs at a time in a hare-skin, which is always hung on the top boughs of trees. When magpies notice a person observing their nest with special attention, they transfer the eggs somewhere else. It is reported that in the case of these birds, as their claws are not adapted for grasping and carrying the eggs, this is effected in a remarkable manner: they place a sprig on the top of two eggs at a time, and solder it with glue from their belly, and placing their neck under the middle of it so as to make it balance equally on both sides, carry it off somewhere else.

51. Nor yet are those species less cunning which, because the weight of their body forbids their soaring aloft, make their nests on the ground. The name of bee-eater is given to a bird that feeds its parents in their lair; its wings are a pale colour inside and dark-blue above, reddish at the tip. It makes its nest in a hole dug in the ground to a depth often feet.

Partridges fortify their retreat with thorn and bush in such a way as to be completely entrenched against wild animals; they heap a soft covering of dust on their eggs. and they do not sit on them at the place where they laid them but remove them somewhere else, lest their frequently resorting there should cause somebody to suspect it. Hen partridges in fact deceive even their own mates, because these in the intemperance of their lust break the hens' eggs so that they may not be kept away by sitting on them; and then the cocks owing to their desire for the hens fight duels with each other; it is said that the one who loses has to accept the advances of the victor. Trogus indeed says this also occurs occasionally with quails and farmyard cocks, but that wild partridges are promiscuously covered by tame ones, and also new-corners or cocks that have been beaten in a fight. They are also captured owing to the fighting instinct caused by the same lust, as the leader of the whole flock sallies out to battle against the fowler's decoy, and when he has been caught number two advances, and so on one after another in succession. Again about breeding time the hens are caught when they sally out against the fowlers' hen to hustle and drive her away. And in no other creature is concupiscence so active. If the hens stand facing the cocks they become pregnant by the afflatus that passes out from them, while if they open their beaks and put out their tongue at that time they are sexually excited. Even the draught of air from cocks flying over them, and often merely the sound of a cock crowing, makes them conceive. And even their affection for their brood is so conquered by desire that when a hen is quietly sitting on her eggs in hiding, if she becomes aware of a fowler's decoy hen approaching her cock she chirps him back to her and recalls him and voluntarily offers herself to his desire. Indeed they are subject to such madness that often with a blind swoop they perch on the fowler's head. If he starts to go towards a nest, the mother bird runs forward to his feet, pretending to be tired or lame, and in the middle of a run or a short flight suddenly falls as if with a broken wing or damaged feet, and then runs forward again, continually escaping him just as he is going to catch her and cheating his hope, until she leads him away in a

different direction from the nests. On the other hand if the hen thus scared is free and not possessed with motherly anxiety she lies on her back in a furrow and catches hold of a clod of earth with her claws and covers herself with it.

The life of partridges is believed to extend to as much as sixteen years.

52. Next to partridges the habits of pigeons are most noticeable for a similar reason. These possess the greatest modesty, and adultery is unknown to either sex; they do not violate the faith of wedlock, and they keep house in companyunless unmated or widowed a pigeon does not leave its nest. Also they say that the cock pigeon is domineering, and occasionally even unkind, as he is suspicious of adultery although not himself prone to it; in this state his throat is full of complaining and his beak deals savage pecks, and upon his satisfaction there follows billing and fawning with repeated twirlings of his feet during his entreaties for indulgence. Both partners have equal affection for their offspring; this also often gives occasion for chastisement, when the hen is too slack in coming home to the chicks. When she is producing a brood she receives comfort and attendance from the cock. For the chicks at first they collect saltish earth in their throat and disgorge it into their beaks, to get them into proper condition for food. It is a peculiarity of this species and of the turtledove not to raise the neck backward when drinking, and to take copious draughts like cattle.

We have authorities for saying that woodpigeons live to be thirty and in some cases forty years old, only with the single inconvenience of their clawsthis also a sign of old agewhich have to be cut to prevent damage. The cooing of all is alike and the same, composed of a phrase repeated three times and then a sigh at the close; in winter they are silent, but begin singing in spring. Nigidius thinks that a woodpigeon when sitting on her eggs under a roof will leave her nest in answer to her name. They lay after midsummer. Pigeons and turtledoves live eight years. On the other hand the sparrow, their equal in salaciousness, has a very small span of life: the cocks are said not to last longer than a year, the proof being that at the beginning of spring no black colouring is seen on their beak, which begins with summer; but the hens have a rather longer span of life. However pigeons actually possess a certain sense of vanityvou would fancy them to be conscious of their own colours and the pattern of their marking; indeed this can be inferred from their flightit is observed that they flap their wings in the sky and trace a variety of lines. During this display they expose themselves to the hawk as if fettered, folding their wings with a flapping noise that is only produced from the actual wing joints, though otherwise when flying freely they are much swifter. The highwayman hawk watches concealed in foliage, and seizes the exultant pigeon in the very act of showing off. For that reason the bird called kestrel must be classed with these; for it defends the pigeons, and scares the hawks by its natural powerfulness so much that they fly from sight and sound of it. For this reason woodpigeons have a special love for kestrels, and they say that if kestrels put in new jars with their mouths sealed up are hidden in the four corners of the dovecot the pigeons do not change their abode (a result that some people have also sought to obtain by cutting the joints of their wings with gold, the only way of making a wound that does no harm), although otherwise the pigeon is a bird much given to straying. For they have a trick of exchanging blandishments and enticing other pigeons and coming back with a larger company won by intrigue

53. Moreover also they have acted as go-betweens in important affairs, when at the siege of Modena Decimus Brutus sent to the consuls' camp despatches tied to their feet; what use to Antony were his rampart and watchful besieging force, and even the barriers of nets that he stretched in the river, when the message went by air. Also pigeon-fancying is carried to insane lengths by some people: they build towers on their roofs for these birds, and tell stories of the high breeding and pedigrees of particular birds, for which there is now an old precedent: before Pompey's civil war Lucius Axius, Knight of Rome, advertised pigeons for sale at 400 denarii per braceso Marcus Varro relates. Moreover the largest birds, which are believed to be produced in Campania, have conferred fame on their native place.

54. The flight of these birds. prompts one to turn to the consideration of the other birds as well. All the rest of the animals have one definite and uniform mode of progression peculiar to their particular kind, but birds alone travel in a variety of ways both on land and in the air. Some walk, as crows; others hop, as sparrows and blackbirds; run, as partridges and black grouse; throw out their feet in front of them, as storks and cranes. Some spread their wings and at rare intervals let them droop and shake them; others do so more frequently, but also only the tips of the wings; others flap the whole of their sides: but there are some that fly with their wings for the greater part folded, and after giving one stroke, or others also a repeated stroke, are borne by the air: by as it were squeezing it tight between their wings, they shoot upward or horizontally or downward. Some you would think to be flung forward, or again in some cases to fall from

a height and in other cases to leap upward. Only ducks and birds of the same kind soar up straight away, and move skyward from the start, and this even from water; and consequently they alone when they have fallen into the pits that we use for trapping wild animals get out again. Vultures and the heavier birds in general cannot fly upward except after a run forward or when launching from a higher eminence; they steer with their tail. Some birds turn their gaze round, others bend their necks; and some eat things they have snatched with their feet. Many do not fly without a cry, others on the contrary are always silent when in flight. They move upward, downward, slanting, sideways, straight forward, and some even with the head bent backward; consequently if several kinds are seen at the same time, they might be thought not to be travelling in the same element.

55. The greatest flyers are the species resembling swallows called (because they lack the use of feet) and by others 'cypseli.' They build their nests on crags. These are the birds seen all over the sea, and ships never go away from land on so long or so unbroken a course that they do not have apodes flying round them. All the other kinds alight and perch, but these never rest except on the nest: they either hover or lie on a surface.

56. Birds' dispositions also are equally varied, especially in respect of food. Those called goat-suckers, which resemble a rather large blackbird, are night thievesfor they cannot see in the daytime. They enter the shepherds' stalls and fly to the goats' udders in order to suck their milk, which injures the udder and makes it perish, and the goats they have milked in this way gradually go blind. There is a bird called the shoveller-duck which flies up to the sea-divers and seizes their heads in its bill till it wrings their catch from them. The same bird after filling itself by swallowing shells brings them up again when digested by the warmth of the belly and so picked out from them the edible parts, discarding the shells.

57. Farmyard hens actually have a religious ritual: after laying an egg they begin to shiver and shake, and purify themselves by circling round, and make use of a straw as a ceremonial rod to cleanse themselves and the eggs. The smallest of birds, the goldfinches, perform their leader's orders, not only with their song but by using their feet and beak instead of hands. One bird in the Arles district, called the bull-bird although really it is small in size, imitates the bellowing of oxen. Also the bird whose Greek name is 'flower,' when driven away from feeding on grass by the arrival of horses, imitates their neighing, in this way taking its revenge.

58. Above all, birds imitate the human voice, parrots indeed actually talking. India sends us this bird; its name in the vernacular is siptaces; its whole body is green, only varied by a red circlet at the neck. It greets its masters and repeats words given to it, being particularly sportive over the wine. Its head is as hard as its beak; and when it is being taught to speak it is beaten on the head with an iron rodotherwise it does not feel blows. When it alights from flight it lands on its beak, and it leans on this and so reduces its weight for the weakness of its feet.

59. A certain kind of magpie is less celebrated, because it does not come from a distance, but it talks more articulately. These birds get fond of uttering particular words, and not only learn them but love them, and secretly ponder them with careful reflexion, not concealing their engrossment. It is an established fact that if the difficulty of a word beats them this causes their death, and that their memory fails them unless they hear the same word repeatedly, and when they are at a loss for a word they cheer up wonderfully if in the meantime they hear it spoken. Their shape is unusual, though not beautiful: this bird has enough distinction in its power of imitating the human voice. But they say that none of them can go on learning except ones of the species that feeds on acorns, and among these those with five claws on the feet learn more easily, and not even they themselves except in the two first years of their life. All the birds in each kind that imitate human speech have exceptionally broad tongues, although this occurs in almost all species; Claudius Caesar's consort Agripping had a thrush that mimicked what people said. which was unprecedented. At the time when I was recording these cases, the young princes a had a starling and also nightingales that were actually trained to talk Greek and Latin, and moreover practised diligently and spoke new phrases every day, in still longer sentences. Birds are taught to talk in private and where no other utterance can interrupt. with the trainer sitting by them to keep on repeating the words he wants retained, and coaxing them with morsels of food.

60. Let us also repay due gratitude to the ravens the gratitude that is their due, evidenced also by the indignation and not only by the knowledge of the Roman nation. When Tiberius was emperor, a young raven from a brood hatched on the top of the Temple of Castor and Pollux flew down to a cobbler's shop in the vicinity, being also commended to the master of the establishment by religion. It soon picked up the habit of talking, and every morning used to fly off to the Platform that faces the forum and salute Tiberius and then

Germanicus and Drusus Caesar by name, and next the Roman public passing by, afterwards returning to the shop; and it became remarkable by several years' constant performance of this function. This bird the tenant of the next cobbler's shop killed, whether because of his neighbour's competition or in a sudden outburst of anger, as he tried to make out, because some dirt had fallen on his stock of shoes from its droppings; this caused such a disturbance among the public that the man was first driven, out of the district and later actually made away with, and the bird's funeral was celebrated with a vast crowd of followers, the draped bier being carried on the shoulders of two Ethiopians and in front of it going in procession a flute-player and all kinds of wreaths right to the pyre, which had been erected on the right hand side of the Appian Road at the second milestone on the ground called Rediculus's Plain. So adequate a justification did the Roman nation consider a bird's cleverness to be for a funeral procession and for the punishment of a Roman citizen, in the city in which many leading men had had no obsequies at all, while the death of Scipio Aemilianus after he had destroyed Carthage and Numantia not been avenged by a single person. The date of this was 28 March, AD 36, in the consulship of Marcus Servilius and Gaius Cestius. At the present day also there was in the city of Rome at the time when I was publishing this book a crow belonging to a Knight of Rome, that came from Sonthern Spain, and was remarkable in the first place for its very black colour and then for uttering sentences of several words and frequently learning still more words in addition. Also there was recently a report of one Crates surnamed Monoceros in the district of Eriza in Asia hunting with the aid of ravens, to such an extent that he used to carry them down into the forests perched on the crest's of his helmet and on his shoulders; the birds used to track out and drive the game, the practice being carried to such a point that even wild ravens followed him in this way when he left the forest. Certain persons have thought it worth recording that a raven was seen during a drought dropping stones into a monumental urn in which some rain water still remained but so that the bird was unable to reach it; in this way as it was afraid to go down into the urn, the bird by piling up stones in the manner described raised the water high enough to supply itself with a drink.

61. Nor will I pass by the birds of Diomede. Juba calls them Plungers-birds, also reporting that they have teeth, and that their eyes are of a fiery red colour but the rest of them bright white. He states that they always have two leaders, one of whom leads the column and the other brings up the rear; that they hollow out trenches with their beaks and then roof them over with lattice and cover this with the earth that they have previously dug from the trenches and in these they hatch their eggs; that the trenches of all of them have two doors, that by which they go out to forage facing east and that by which they return west; and that when about to relieve themselves they always fly upwards and against the wind. These birds are commonly seen in only one place in the whole world, in the island which we spoke of as famous for the tomb and shrine of Diomede, off the coast of Apulia, and they resemble coots. Barbarian visitors they beset with loud screaming, and they pay deference only to Greeks, a remarkable distinction, as if paying this tribute to the race of Diomede; and every day they wash and purify the temple mentioned by filling their throats with water and wetting their wings; which is the source of the legend that the comrades of Diomede were transformed into the likeness of these birds.

62. In a discussion of mental faculties it must not be omitted that among birds swallows and among land animals mice are unteachable, whereas elephants execute orders and lions are yoked to chariots, and in the sea seals and ever so many kinds of fish can be tamed.

63. Birds of the kinds that have long necks drink by suction, stopping now and then and so to speak pouring the water into themselves by bending their head back. Only the porphyrio drinks by beakfuls; it also eats in a peculiar way of its own, continually dipping all its food in water and then using its foot as a hand with which to bring it to its beak. The most admired variety of sultana-hen is in Commagene; this has a red beak and very long red legs.

64. The long-legged plover has the same, a much smaller bird although with equally long legs. It is born in Egypt. It stands on three toes of each foot. Its food consists chiefly of flies. When brought to Italy it lives only for a few days.

65. All the heavier birds feed also on grain, but the scaring species on flesh only, and so among aquatic birds the cormorants, who regularly devour what the rest disgorge.

66. Pelicans have a resemblance to swans, and would be thought not to differ from them at all were it not that they have a kind of second stomach in their actual throats. Into this the insatiable creature stows everything, so that its rapacity is marvellous. Afterwards when it has done plundering it gradually returns the things from this pouch into its mouth and passes them into the true stomach like a ruminant animal. These birds come to us from the extreme north of Gaul. 67. We have been told of strange kinds birds in the Hereynian Forest of Germany whose feathers shine like fires at nighttime; but in the other forests nothing noteworthy occurs beyond the notoriety caused by remoteness. The most celebrated water-bird in Parthian Seleucia and in Asia is the phalaris-duck, the most celebrated bird in Colchis the pheasantit droops and raises its two feathered earsand in the Numidian part of Africa the Numidic fowl all of these are now found in Italy.

68. Apicius, the most gluttonous gorger of all spendthrifts, established the view that the flamingo's tongue has a specially fine flavour. The francolin of Ionia is extremely famous. Normally it is vocal, though when caught it keeps silent. It was once considered one of the rare birds, but now it also occurs in Gaul and Spain. It is even caught in the neighbourhood of the Alps, where also cormorants occur, a bird specially belonging to the Balearic Islands, as the chough, black with a yellow beak, and the particularly tasty willowgrouse belong to the Alps. The latter gets its name of 'harefoot' from its feet which are tufted like a hare's, though the rest of it is bright white; it is the size of a pigeon. Outside that region it is not easy to keep it, as it does not grow tame in its habits and very quickly loses flesh. There is also another bird with the same name that only differs from quails in size, yellow-coloured, very acceptable for the table. Egnatius Calvinus, Governor of the Alps, has stated that also the ibis, which properly belongs to Egypt, has been seen by him in that region

69. There also came into Italy during the battles of the civil war round Bedriacum north of the Po the 'new birds' for so they are still calledwhich are like thrushes in appearance and a little smaller than pigeons in size, and which have an agreeable flavour. The Balearic Islands send the porphyrio, an even more splendid bird than the one mentioned above. In those islands the buzzard of the hawk family is also in repute for the table, and the vipio as wellthat is their name for the smaller crane.

70. The pegasus bird with a horse's head and the griffin with ears and a terrible hooked beakthe former said to be found in Scythia and the latter in Ethiopia judge to be fabulous; and for my own part I think the same about the bearded eagled attested by a number of people, a bird larger than an eagle, having curved horns on the temples, in colour a rusty red, except that its head is purple-red. Nor should the sirens obtain credit, although Dinon the father of the celebrated authority Clitarchus declares that they exist in India and that they charm people with their song and then when they are sunk in a heavy sleep tear them in pieces. Anybody who would believe that sort of thing would also assuredly not deny that snakes by licking the ears of the augur Melampus gave him the power to understand the language of birds, or the story handed down by Democritus, who mentions birds from a mixture of whose blood a snake is born, whoever eats which will understand the conversations of birds and the things that he records about one crested lark in particular, as even without these stories life is involved in enormous uncertainty with respect to auguries. Homer mentions a kind of bird called the scops; many people speak of its comic dancing movements when it is watching for its prey, but I cannot easily grasp these in my mind, nor are the birds themselves now known. Consequently a discussion of admitted facts will be more profitable.

71. The people of Delos began the practice of fattening hens, which has given rise to the pestilential fashion of gorging fat poultry basted with its own gravy. I find this first singled out in the old interdicts dealing with feasts as early as the law of the consul Gaius Fannius eleven before the Third Panic War. prohibiting the serving of any bird course beside a single hen that had not been fatteneda provision that was subsequently renewed and went on through all our sumptuary legislation. And a way round so as to evade them was discovered, that of feeding male chickens also with foodstuffs soaked in milk, a method that makes them esteemed as much more acceptable. As for hens, they are not all chosen for fattening, and not unless they have fat skin on the neck. Subsequently came elaborate methods of dressing fowls, so as to display the haunches, so as to split them along the back, so as to make them fill the dishes by spreading them out from one foot. Even the Parthians bestowed their fashions on our cooks. And nevertheless with all this showing off, no entire dish finds favour, only the haunch or in other cases the breast being esteemed.

72. Aviaries with cages containing all kinds of birds were first set up by Marcus Laenius Strabo of the Order of Knighthood at Brindisi. From him began our practice of imprisoning within bars living creatures to which Nature had assigned the open sky. Nevertheless the most remarkable instance in this record is the dish belonging to the tragic actor Clodius Aesop, rated at the value of 100,000 sesterces, in which he served birds that sang some particular song or talked with human speech, which he acquired at the price of 6000 sesterces apiece, led by no other attraction except the desire to indulge in a sort of cannibalism in eating these birds, and not even showing any respect for that lavish fortune of his, even though won by his voicein fact a worthy father of a son whom we have spoken of as swallowing pearls, though not so much so as to make me wish to give a true decision in the competition in baseness between the two, unless in so far as it is a smaller thing to have dined on the most bounteous resources of Nature than on the tongues of men.

73. The reproductive system of birds appears to be simple, although even this possesses marvels of its own, since even four-footed creatures produce eggschamaeleons and lizards and those we have specified among aquatic species, and also snakes. But among feathered creatures those that have hooked talons are unfertile. Of these only the lesser kestrel produces more than four eggs at a time. Nature has bestowed on the bird kind the attribute that the species among them that are shy are more prolific than the brave ones; only ostriches, hens and partridges bear very numerous broods. Birds have two methods of coupling, the hen sitting on the ground as in the case of the domestic fowl or standing up as in the case of the crane.

74. The eggs are in some cases white, as with the dove and partridge, in others pale-coloured, as with waterfowl, in others spotted, as those of the guinea-hen, in others of a red colour, as in the case of the pheasant and the lesser kestrel. The inside of every bird's egg is of two colours; in that of the aquatic birds there is more yellow than white, and that yellow is brighter than with the other species. Fishes' eggs are of one colour, which contains no bright white. Birds' eggs are made easily breakable by heat, snakes' eggs are made flexible by cold, and fishes' eggs are softened by liquid. Aquatic species have round eggs, but almost all others oval-shaped ones. They are laid with their roundest part in front, the shell of whatever portions they emerge with being soft but becoming hard immediately after the process. Long-shaped eggs are thought by Horace to have a more agreeable flavour. Eggs of a rounder formation produce a hen chicken and the rest a cock. The navel in eggs is at the top end, projecting like a speck in the shell.

Some birds mate in any season, for instance the domestic fowl, and lay, except in the two midwinter months. Of these kinds the young hens lay more eggs than the old, but smaller ones, and in the same brood those laid first and last are the smallest. But they are so fertile that some even lay eggs sixty times, some lay daily, some twice daily, some so much that they die of exhaustion. Adria birds are most highly spoken of. Pigeons lay ten times a year, some even eleven times, while in Egypt they even lay in a midwinter month. Swallows and blackbirds and woodpigeons and turtledoves lay twice a year, all other birds as a rule only once. Thrushes build their nests of mud in an almost continuous mass on the tops of trees, and breed in retirement. The eggs grow to full size in the uterus in ten days from pairing, but in the case of the domestic fowl and the pigeon, if the hen is disturbed by having a feather torn out or by some similar damage, it takes longer. In all eggs the middle of the yolk contains a small drop of a sort of blood, which people think is the heart of birds, supposing that the heart is the first part that is produced in every body: in an egg undoubtedly this drop beats and throbs. The animal itself is formed out of the white of the egg, but its food is in the yolk. In all cases at the beginning the head is larger than the whole body, and the eyes, which are pressed together, are larger than the head. As the chick grows in size the white turns to the middle and the volk spreads round it. If on the twentieth day the egg be moved, the voice of the chick already alive is heard inside the shell. At the same time it begins to grow feathers, its posture being such that it has its head above its right foot but its right wing above its head. The yolk gradually disappears. All birds are born feet first, the opposite way to the remaining animals. Some domestic hens lay all their eggs in pairs, and according to Cornelius Celsus occasionally hatch twin chicks, one larger than the other; though some assert that twin chicks are never hatched out. They lay down a rule that the hen should not be required to sit on more than 25 eggs at a time. Hens begin to lay at midwinter, and breed best before the spring equinox: chickens born after midsummer do not attain the proper size, and the later they are hatched the more they fall short of it.

75. It pays best for eggs to be sat on within ten days of laying; older or fresher ones are infertile. An odd number should be put under the hen. If three days after they began to be sat on the top of the eggs held in the tips of the fingers against the light shows a transparent colour of a single hue, the eggs are judged to be barren, and others should be substituted for them. They may also be tested in water: an empty egg floats, and consequently people prefer eggs that sink, that is, are full, to put under the hens. But they warn against their being tested by shaking, on the ground that if the vital veins are displaced the eggs are sterile. The ninth's day after a new moon is assigned for starting a hen's sitting, as eggs begun earlier do not hatch out. The chicks are hatched more quickly when the days are warm, and consequently eggs will hatch out in 18 days in summer but 24 in winter. If it thunders while the hen is sitting the eggs die, and if she hears the cry of a hawk they go bad. A remedy against thunder is an iron nail placed under the straw in which the eggs lie, or some

earth from the plough. In some cases Nature hatches of her own accord even without the hen sitting, as on the dunghills of Egypt. We find a clever story about a certain toper at Syracuse, that he used to go on drinking for as long a time as it would take for eggs covered with earth to produce a hatch.

76. Moreover eggs can be hatched even by a human being. Julia Augusta in her early womanhood was with child with Tiberius Caesar by Nero, and being specially eager to a bear a baby of the male sex she employed the following method of prognostication used by girlsshe cherished an egg in her bosom and when she had to lay it aside passed it to a nurse under the folds of their dresses, so that the warmth might not be interrupted; and it is said that her prognostication came true. It was perhaps from this that the method was lately invented of placing eggs in chaff in a warm place and cherishing them with a moderate fire, with somebody to keep turning them over, with the result that all the live brood breaks the shell at once on a fixed day. It is recorded that a certain poultry-keeper had a scientific method of telling which egg was from which hen. It is related also that when a hen has died the cocks of the farmyard have been seen taking on her duties in turn and generally behaving in the manner of a broody hen, and abstaining from crowing. Above all things is the behaviour of a hen when ducks' eggs have been put under her and have hatched outfirst her surprise when she does not quite recognize her brood, then her puzzled sobs as she anxiously calls them to her, and finally her lamentations round the margin of the pond when the chicks under the guidance of instinct take to the water.

77. Marks of good breeding in hens are an upstanding comb, which is occasionally double, black feathers, red beak, and uneven claws, sometimes one lying actually across the four others. Fowls with yellow beak and feet seem not to be unblemished for purposes of religion, and black ones for the mystery rites. Even the dwarf variety is not sterile in the case of the domestic fowl, which is not the case in any other breeds of birds, though with the dwarf fowl reliability in laying is unusual, and sitting on the eggs is harmful to the hen.

78. But the worst enemy of every kind is the pip, and especially between the time of harvest and vintage. The cure is in hunger, and they must lie in smoke, at all events if it be produced from bay-leaves or savin, a feather being inserted right through the nostrils and shifted daily; diet garlic mixed with spelt, either steeped in water in which an owl has been dipped or else boiled with white vine seed, and certain other substances.

79. Pigeons go through a special ceremony of kissing before mating. They usually lay two eggs at a time, nature so regulating as to make some produce larger chicks and others more numerous. The woodpigeon and the turtledove lay at most three eggs at a time, and never more than twice in a spring, and keeping a rule that, if the former lay goes bad, even although they lay three eggs they never rear more than two chicks; the third egg, which is unfertile, they call a windegg. The hen woodpigeon sits from noon till the next morning and the cock the rest of the time. Pigeons always lay a male and a female egg, the male first and the female a day later. In this species both birds sit, the cock in the daytime and the hen at night. They hatch in about three weeks, and they lay four days after mating. In summer indeed they sometimes produce three pairs of chickens every two months, for they hatch on the 17th day and breed immediately: consequently eggs are often found among the chickens, and some are beginning to fly just when others are breaking the egg. Then the chicks themselves begin laying when five months old. However in the absence of a cock hen birds actually mate with one another indifferently, and produce unfertile eggs from which nothing is produced, which the Greeks call wind-eggs.

The peahen begins to lay when three months of old. In the first year it lays one egg or a second one, but in the following year four or five at a time, and in the remaining years twelve at a time, but not more, with intervals of two or three days between the eggs, and three times in the year, provided that the eggs are put under farmyard hens to sit on. The male peacock breaks the eggs, out, of desire for the female sitting on them; consequently the hen bird lays at night, and in hiding or when perching on a high placeand unless the eggs are caught on a bed of straw they are broken. One cock can serve five hens, and when there have been only one or two hens for each cock their fertility is spoiled by its salaciousness. The chickens are hatched in 27 days or at latest on the 29th.

Geese mate in the water; they lay in spring, or if they mated in midwinter, after midsummer; they lay nearly 40 eggs, twice in a year if the hens turn the first brood out of the nest, otherwise sixteen eggs at the most and seven at the fewest. If somebody removes the eggs, they go on laying till they burst. They do not turn strange eggs out of the nest. It pays best to put nine or eleven eggs for them to sit on. The hens sit only 30 days at a time, or if the days are rather warm, 25. The touch of a nettle is fatal to goslings, and not less so is their greediness, sometimes owing to their excessive gorging and sometimes owing to their own violence, when they have caught hold of a root in their beak and in their repeated attempts to tear it off break their own necks before they succeed. A nettle-root put under their straw after they have lain in it is a cure for nettle-sting.

There are three kinds of heron, the white, the speckled and the dark. These birds suffer pain, in mating, indeed the cocks give loud screams and even shed blood from their eyes; and the broody hens lay their eggs with equal difficulty. The eagle sits on her eggs for thirty days at a time, and so do the larger birds for the most part, but the smaller ones, for instance the kite and hawk, sit for twenty days. A kite's brood usually numbers two chicks, never more than three, that of the bird called the merlin as many as four, and the raven's occasionally even five; they sit for the same number of days. The hen crow is fed by the cock while sitting. The magpie's brood numbers nine, the blackcap's over twenty and always an odd number, and no other bird has a larger brood: so much more prolific are the small species. A swallow's first chicks are blind, as are those of almost all species that have a comparatively large brood.

80. Unfertile eggs, which we have designated wind-eggs, are conceived by the hen birds mating together in a pretence of sexual intercourse, or else from dust, and not only by hen pigeons but also by farmyard hens, partridges, peahens, gese and ducks. But these eggs are sterile, and of smaller size and less agreeable flavour, and more watery. Some people think they are actually generated by the wind, for which reason they are also called Zephyr's eggs; but wind-eggs are only produced in spring, when the hens have left off sitting: another name for them is addle-eggs. When steeped in vinegar eggs become so much softer that they can be passed through rings. It pays best to keep them in bean meal, or else chaff in winter and bran in summer; it is believed that keeping them in salt drains them quite empty.

81. The only viviparous creature that flies is the bat, which actually has membranes like wings; it is also the only flyer that nourishes its young with milk, bringing them to its teats. It bears twins, and flits about with its children in its arms, carrying them with it. The bat is mid to have a single hipbone. Gnats are its favourite fodder.

82. On the other hand among land animals, the snake is oviparous; we have not yet described this species. Snakes mate by embracing, intertwining so closely that they could be taken to be a single animal with two heads. The male viper inserts its head into the female viper's mouth, and the female is so enraptured with pleasure that she gnaws it off. The viper is the only land animal that bears eggs inside it; they are of one colour and soft like fishes' roe. After two days she hatches the young inside her uterus, and then bears them at the rate of one a day, to the number of about twenty; the consequence is that the remaining ones get so tired of the delay that they burst open their mother's sides, so committing matricide. All the other kinds of snakes incubate their eggs in a clutch on the ground, and hatch out the young in the following year. Crocodiles take turns to incubate, male and female. But let us give an account of the mode of reproduction of the remaining land animals as well

83. Man is the only viviparous biped. Man is the only animal with which mating for the first time is followed by repugnance, which is doubtless an augury of life as sprung from regrettable source. All the other animals have fixed seasons of the year for mating, but man, as has been said, mates at every hour of the day and night. All the others experience satiety in coupling, but with man this is almost entirely absent. Claudius Caesar's consort Messalina, thinking that this would be a truly regal triumph, selected for a competition in it a certain maid who was the most notorious of the professional prostitutes, and beat her in a twenty-four hours' match, with a score of twenty-five. In the human race the males have devised every out-of-the-way form of sexual indulgence, crimes against nature, but the females have invented abortion. How much more guilty are we in this department than the wild animals! Hesiod has stated that men have stronger sexual appetites in winter and women in summer.

Species with the genital organs behind them, elephants, camels, tigers, lynxes, the rhinoceros the lion, the hairyfooted and the common rabbit couple back to back. Camels even make for deserts or else places certain to be secret, and one is not allowed to interrupt them without disaster; the coupling lasts a whole day, and this is the case with these alone of all animals. With the solid-hooved species in the quadruped class the males are excited by scenting the female. Also dogs, seals and wolves turn away in the middle of coupling and still remain coupled against their will. Among the above-mentioned species, of hares the females usually cover first, but with all the others the males; but bears, as was said, couple, like human beings, lying down, hedgehogs both standing up and embracing each other, eats with the male standing and the female lying beneath it, foxes lying down on their sides and the female embracing the male. Cows and does resent the violence of the bulls and stags, and consequently walk forward in pairing. Stags pass across to other hinds and return to the former ones alternately. Lizards like the creatures without feet practise intercourse by intertwining.

All animals are less fertile the larger they are in bulk. Elephants, camels and horses produce off-spring one at a time, but the thistle-finch, the smallest of birds, twelve at a time. Those that produce most young bear them most quickly; the larger the animal, the longer it takes to be shaped in the womb; the more long-lived ones are cared for longer by the mother. Also animals are not of an age suitable for procreation while they are still growing. Solidhoofed animals bear one child at a time, those with cloven hooves also bear two, but those whose feet are divided into separate toes also produce a larger number. But whereas all those above bear their offspring fully formed, these produce them unfinishedin this class being lionesses and bears; and a fox bears its young in an even more unfinished state than the species abovementioned, and it is rare to see one in the act of giving birth. Afterwards all these species warm their offspring and shape them by licking them. Their litters number four at the most. Dogs, wolves, panthers and jackals bear their young blind.

There are several kinds of dogs. The Spartan hounds breed when both sexes are seven months old; the bitches carry for 60 days, and 63 at most. The bitches of the other breeds are willing to couple, even when six months old. They all conceive from a single coupling. Those that are bred from before the proper time have puppies that stay blind longer, and all of them for the same number of days. They are believed to raise the leg in making water when about six months old; this is a sign of fully matured strength. Bitches relieve themselves sitting. The most prolific have litters of twelve, but usually they have five or six, and sometimes only one: this is considered portentous, as are litters that are all males or all females. Male puppies are born first in each litter, whereas in all other animals the sexes come in turns. Bitches couple five months after their last litter. The Spartan hounds have litters of eight. The males of that breed are marked by keenness for work. Spartan dog hounds live ten years, bitches twelve; all the other breeds live fifteen years, some times even twenty. But they do not breed all their lives, ceasing usually at the age of twelve.

The cat and the mongoose resemble dogs in other respects, but their length of life is ten years. Rabbits breed in every month of the year, and superfetate, as do hares; after giving birth they pair again at once. They conceive although still suckling their previous litter, but the young are blind. Elephants, as we have said, bear one young one at a time, of the size of a three months old calf. Camels carry their young twelve months; they begin breeding at the age of three, in the spring, and mate again a year after giving birth. Mares on the other hand are believed not to be profitably sired till three years old, and not before a year after their last foaling; when they are unwilling, compulsion is used. It is believed that sheasses conceive quite easily even a week after delivery. It is said that mares' manes ought to be clipped to make them submit to allow coupling with asses, as having long manes makes them proud and high-spirited. Mares are the only animals that after coupling run in a northerly or southerly direction according as they have conceived a male or a female foal. Immediately afterwards they change the colour of their coat for a deeper red or a darker hue of whatever their colour is: this marks their ceasing to be able to couple, even if willing to do so. Some are not hindered from work by foaling, and are in foal without its being known. We find it on record that a mare in foal belonging to a Thessalian named Echecratides won a race at Olympia. It is stated by exceptionally careful authorities that horses, dogs and swine like mating in the morning, but that the females make approaches in the afternoon; that mares that have been broken are in heat 60 days sooner than those running with the herd; that swine only foam at the mouth when mating; that when a boar-pig has heard a sow in heat grunting it refuses food to the point of losing flesh entirely unless it is admitted to her, while sows get so fierce that they will gore a human being, especially one wearing white clothes. This madness can be reduced by sprinkling the organs with vinegar. It is believed that desire for mating is also stimulated by articles of diet, for instance rocket in the case of a man and onions in the case of cattle. It is a remarkable fact that wild species when domesticated refuse to breed, for instance wild geese, and wild boars and stags do so reluctantly and only if they have been reared from infancy. Female animals refuse intercourse when pregnant, except the mare and the sow; but only the common rabbit and the hairy-footed rabbit allow superfetation.

84. All viviparous species produce their young head foremost, the embryo turning round shortly before delivery, but otherwise lying stretched at length in the womb. Fourfooted species are carried with the legs stretched out to full length and folded against their own belly, but the human embryo curled up in a ball, with the nostrils placed between the two knees. It is thought that moon calves, about which we have spoken before, are produced when a woman has conceived not from a male but from herself alone, and that they do not come alive because they are not produced from two parents, and they possess the self-nourishing vitality that belongs to plants and frees. Of all the species bearing fully developed offspring pigs alone have litters that are numerous

as well as developed, for it is against the nature of those with solid or cloven hoofs to produce several young.

solid or cloven hoofs to produce several young. 85. The most prolific of all animals whatever is the mouseone hesitates to state its fertility, even though on the authority of Aristotle and the troops of Alexander the Great. It is stated that with it impregnation takes place by licking and not by coupling. There is a record of 120 being born from a single mother, and in Persia of mice already pregnant being found in the parent's womb: and it is believed that they are made pregnant by tasting salt. Accordingly it ceases to be surprising how so large an army of field-mice ravages the crops; and in the case of field-mice it is also hitherto unknown exactly how this vast multitude is suddenly destroyed: for they are never found dead, and nobody exists who ever dug up a mouse in a field in winter. Vast numbers thus appear in the Troad, and they have by now banished the inhabitants from that country. They appear during droughts. It is also related that when a mouse is going to die a worm grows in its head. The mice in Egypt have hard hair like hedgehogs, and also they walk on two feet, as also do the Alpine mice. When animals of a different kind pair, the union is only fertile when the two species have the same period of gestation. There is a popular belief that of the oviparous quadrupeds the lizard bears through the mouth, but this is denied by Aristotle. Lizards do not hatch their eggs, but forget where they laid them, as this animal has no memory; and consequently the young ones break the shell without assistance.

86. We have it from many authorities that a snake may be born from the spinal marrow of a human being. For a number of animals spring from some hidden and secret source, even in the quadruped class, for instance salamanders, a creature shaped like a lizard, covered with spots, never appearing except in great rains and disappearing in fine weather. It is so chilly that it puts out fire by its contact, in the same way as ice does. It vomits from its mouth a milky slaver, one touch of which on any part of the human body causes all the hair to drop off, and the portion touched changes its colour and breaks out in a tetter.

87. Consequently some creatures are born from parents that themselves were not born and were without any similar origin, like the ones mentioned above and all those that are produced by the spring and a fixed season of the year. Some of these are infertile, for instance the salamander, and in these there is no male or female, as also there is no sex in eels and all the species that are neither viviparous nor oviparous; also oysters and the other creatures clinging to the bottom of shallow water or to rocks are neuters. But self-generated creatures if divided into males and females do produce an offspring by coupling, but it is imperfect and unlike the parent and not productive in its turn: for instance flies produce maggots. This is shown more clearly by the nature of the creatures called insects, all of which are difficult to describe and must be discussed in a work devoted specially to them. Consequently the psychology of the before said creatures, and the remainder of the discussion, must be appended.

88. Among the senses, that of touch in man ranks before all the other species, and taste next; but in the remaining senses he is surpassed by many other creatures. Eagles have clearer sight, vultures a keener sense of smell, moles acuter hearingalthough they are buried in the earth, so dense and deaf an element of nature, and although moreover all sound travels upward, they can overhear people talking, and it is actually said that if you speak about them they understand and run away. Among men, when one is first of all denied hearing he also is robbed of the power of talking, and there are no persons deaf from birth who are not also dumb. The sea-oyster probably has no sense of hearing; but it is said that the razor-shell dives at a sound: consequently people fishing make a practice of silence.

89. Fish indeed have no auditory organs or passages, but nevertheless it is obvious that is they hear, inasmuch as it can be observed that in some fishponds wild fish have a habit of flocking together to be fed at the sound of clapping, and in the Emperor's aquarium the various kinds of fish come in answer to their names, or in some cases individual fish. Consequently it is also stated that the mullet, the wolf-fish, the stork-fish and the chromis hear very clearly, and therefore live in shallow water.

90. It is clearly obvious that fish possess a sense of smell, as they are not all attracted by the same food, and they smell a thing before they seize it. Some fish even when hiding in caves are driven out by a fisherman who smears the mouth of the crag with brine used in picklingthey run away as it were from the recognition of their own dead body; and they also flock together from the deep water to certain smells, for instance a burnt cuttlefish or polyp, which are thrown into wicker creels for this purpose. Indeed the stench of a ship's bilge makes them flee far away, but most of all the blood of fishes. The polyp cannot be dragged away from the bait: but when a sprig of marjoram is brought near to it, it at once darts away from the scent. Purple-fish also can be caught by means of things with a foul smell. As to the rest of the animal class who could have any doubt? Snakes are driven away by the stench of burnt stag's horn, but especially by that of styrax-tree gum; the scent of marjoram or lime or sulphur kills ants. Gnats seek for sour things and are not attracted by sweet things.

All creatures have the sense of touch, even those that have none of the others; it is possessed even by molluscs, and also, among land animals, by worms.

91. I am inclined to believe that all possess the sense of taste also; for why are different species attracted by different flavours? In the matter of taste nature's handicraft is outstanding: some creatures catch their prey with their teeth, others with their claws, others snatch their food with the curve of the beak, others root it up with the flat of the beak, others dig it out with the point; some suck it in, others lick it, sup it up, chew it, gulp it down. Nor is there less variety in the service rendered by their feet, in snatching, tearing asunder, holding, squeezing, hanging, or incessantly scratching the earth.

92. Wild goats and quails, the most peaceful of creatures, grow fat, as we have said, on poisons, but snakes batten on eggs, serpents having a remarkably skilful trickthey either gulp the eggs down whole, if their throats have grown large enough to hold them, and then break them inside them by rolling themselves up in a coil, and so cough out the bits of eggshell, or if they are young snakes as yet of too tender an age, they catch hold of the eggs in the ring of their coil and squeeze them so gradually and forcibly that part is cut off as if with a knife from the remainder which is held in their folds and then they stick it in. In a like manner they swallow birds whole and the with a heave bring up again the feathers and the bones.

93. Scorpions live on earth. Snakes are specially fond of wine when they have the chance, though otherwise they need little drink; they also need very little food, and almost none at all when they are kept shut up; just as do spiders also, which otherwise live by suction. Consequently no venomous creature dies of hunger or thirst; for they have neither heat nor blood, nor vet sweat, which increases appetite by its natural salt. All in this class are more deadly if they have eaten their own kind before they attack somebody. The class of dog-headed apes and orang-utans stores food in the recesses of the jawbones, and then gradually takes it out from there with its hands to chew itand what with ants is an annual ceremony is for these a daily or hourly practice. The only animal with toes that lives on grass is the hare; solid-hooved animals live on grass and corn, and among animals with cloven feet the pig eats all kinds of fodder and also roots. Rolling on the ground is peculiar to animals with solid hooves. All species with serrated teeth are carnivorous. Bears also eat grain, leaves, grapes and fruits and bees, and even crabs and ants. Wolves. as we have said, when hungry even eat earth. Cattle grow fat with drinking, and consequently salt is specially suitable for them. So also do beasts of burden, although they also fatten on corn and grass; in fact they eat in proportion to what they have drunk. Beside the ruminants already mentioned, of forest animals stags ruminate when they are kept by us; but they all ruminate lying down in preference to standing, and in winter more than in summer, for a period of about seven months. The mice of Pontus also remasticate their food in a similar manner.

94. In drinking, animals with serrated teeth lap, and so does our common mouse, though it really belongs to another class; those with teeth that touch suck for instance horses and cattle; bears do neither, but gulp water as well as food in bites. In Africa the greater part of the wild animals do not drink at all in summer, owing to lack of rains for which reason Libyan mice in captivity die if given drink. The perpetually dry parts of Africa produce the antelope, which owing to the nature of the region goes without drink in quite a remarkable fashion, for the assistance of thirsty people, as the Gaetulian brigands rely on their help to keep going, bladders containing extremely healthy liquid being found in their body.

In Africa also leopards crouch in the thick foliage of the trees and hidden by their boughs leap down on to animals passing by, and stalk their prey from the perches of birds. Then how silently and with what a light tread do cats creep up to birds! how stealthilly they watch their chance to leap out on tiny mice! They scrape up the earth to bury their droppings, realizing that the smell of these gives them away.

95. Consequently it is easily manifest that there are also certain senses other than those mentioned above.

For animals have certain kinds of warfare and of friendships, and the feelings that result from them besides the various facts that we have stated about each species in their places. There are quarrels between swans and eagles: between the raven and the golden oriole when searching for one another's eggs by night; similarly between the raven and the kite when the former snatches the latter's food before he can get it; between crows and owls, the eagle and the gold-crestif we can believe it, as the eagle is called the king of birds; between owls and the other smaller birds; again birds with land animalsthe weasel and the crow, the turtle-dove and the pyrallis, ichneumonflies and spiders; the water-birds brenthos and gull and goshawk and buzzard; shrew-mice and herons lying in wait for each other's young; that very tiny bird the titmouse with the ass, which by rubbing itself against thorns for the sake of scratching dislodges the nests of the titmouse, which is so

scared that when it merely hears the sound of an ass braving it throws its eggs out of the nest, and the chicks themselves in fear fall out, and consequently the bird flies at the ass and hollows out its sores with its beak; foxes and kites; snakes and weasels and pigs. There is a small bird called the aesalon that breaks a raven's eggs, whose chicks are preyed upon by foxes, and it retaliates by pecking the fox-cubs and the vixen herself; when the ravens see this they come to their aid against the aesalon as against a common foe. Also the gold-finch lives in thorn-bushes and consequently it also hates asses that devour the flowers of the thorn; but the yellow wagtail hates the titmouse so bitterly that people believe that their blood will not mix, and consequently they give it a bad name as used for many poisons. The thos and the lion quarrel. Also the smallest animals quarrel as much as the largest: a tree infested with ants is hollowed out by caterpillars; a spider swings by a thread on to the head of a snake stretched out beneath the shade of its tree, and nips its brain with its jaws so violently that it at once gives a hiss and whirls giddily round, but cannot even break the thread by which the spider hangs, much less get away, and there is no end to it before its death.

96. On the other hand friendships occur between peacocks and pigeons, turtle-doves and parrots, blackbirds and turtledoves, the crow and the little heron in a joint enmity against the fox kind and the goshawk and kite against the buzzard. Why, are there not signs of affection even in snakes, the most hostile kind of animals? we have mentioned the story that Arcady tells about the snake that saved his master's life and recognized him by his voice. Let us place to the credit of Phylarchus a marvellous tale about an asp: he relates that in Egypt, when it used to come regularly to be fed at someone's table, it was delivered of young ones, and that its hosts' son was killed by one of these; and that when the mother came back for its usual meal it realized the young one's guilt and killed it, and never came back to the house again afterwards.

97. The question of sleep does not involve any obscure conjecture. It is clear that among land animals all those that close the eyes sleep. That also water animals sleep at all events a little is held even by those who doubt about the other kinds; they do not infer this from the eyes, as these creatures have no eyelids, but merely by their quietness: they are seen reposing as if sunk in slumber, and only moving their tails, and waking up in alarm at any disturbance. It is affirmed with more confidence about tunny-fish, because they sleep close to banks or rocks; while flatfish sleep in shallow water, so that they are often taken out by hand. Dolphins and whales, in fact, are heard actually snoring. That insects also sleep is shown by their silence, and by their not even being roused by having lights brought near them.

98. Man when born is beset by sleep for some months, and then day by day his waking period gets longer. An infant begins to dream at once, for it wakes up in a fright, and also imitates sucking. But some children never dream, and with these we find instances in which their dreaming contrary to their usual habit was a sign of approaching death. Here an important topic invites us and one fully supplied with arguments on both sideswhether there are certain cases of foreknowledge present in the mind during repose, and what causes them, or whether it is a matter of chance like most things. If the question be argued by instances, these would doubtless be found to be equal on both sides. It is practically agreed that dreams occurring directly after drinking wine and eating food, and those that come in dozing off to sleep a second time, are false; but sleep is really nothing but the retirement of the mind into its innermost self. It is manifest that, beside human beings, horses, dogs, oxen, sheep and goats dream; it is consequently believed that, dreams also occur in all viviparous species. As to the oviparous creatures it is uncertain, but it is certain that they sleep.

But let us also pass to insects, for these remain creatures of immeasurably minute structure.

NATURAL HISTORY BOOK 11

1. There remain some creatures of immeasurably minute structure cm fact some authorities have stated that they do not breathe and also that they are actually devoid of blood. These are of great number and of many kinds; they have the habits of land-animals and of flying animals, some lacking wings, for instance centipedes, others winged, for instance bees, others of both kinds, for instance ants, some lacking both wings and feet; and all are rightly termed insects, from the incisions which encircle them in some cases in the region of their necks and in others of their chests and stomach and separate off their limbs, these being only connected by a thin tube, with some however the crease of the incision not entirely encircling them, but only at the belly or higher up, with flexible vertebrae shaped like gutter-tilesshowing a craftsmanship on the part of Nature that is more remarkable than in any other case: inasmuch as in large bodies or at all events the larger, ones the process of manufacture was facilitated by the yielding nature of the material, whereas in these minute nothings what method, what power, what labyrinthine perfection is displayed! Where did Nature find a place in a flea for all the senses?and other smaller creatures

can be mentioned, but at what point in its surface did she place sight? where did she attach taste? implant that truculent and relatively very loud voice? with what subtlety she attached the wings, extended the legs that carry the feet, placed a ravenous hollow to serve as a stomach, kindled a greedy thirst for blood and especially human blood! Then with what genius she provided a sharp weapon for piercing the skin, and as if working on a large object, although really it is invisibly minute, created it with alternating skill so as to be at once pointed for digging and tubed for sucking! What teeth she attached to the wood-borer for boring through timber, with the accompanying sound as evidence and made its chief nutriment to consist of wood! But we marvel at elephants' shoulders carrying castles, and bulls' necks and the fierce tossings of their heads, at the rapacity of tigers and the manes of lions, whereas really Nature is to be found in her entirety nowhere more than in her smallest creations. I consequently beg my readers not to let their contempt for many of these creatures lead them also to condemn to scorn what I relate about them, since in the contemplation of Nature nothing can possibly be deemed superfluous.

2. Many people have asserted that insects do not breathe, also arguing in support of this from the fact that they do not possess the internal organs of a respiratory system, and saying that consequently, they live like plants and trees, whereas there is a very great difference between breathing and living; it is for the same reason, they argue, that they do not contain blood either, as this is found in no species lacking a heart and a liver: similarly, they say, things that have not got lungs do not breathe. This gives rise to a long list of questions. For the same people actually say that these creatures have not got a voice, in spite of all the buzzing of bees and chirping of treecrickets, and make other statements the value of which will be judged in their places. For when I have observed Nature she has always induced me to deem no statement about her incredible: nor do I see why such creatures should be more able to live without breathing than to breathe without vital organs, which we have proved to occur even in the case of marine creatures in spite of the fact that their breath is barred by the density and depth of the water. At all events that any creatures fly and yet have no capacity of breathing in spite of their living in the very breath of the air, and that they have consciousness of nutrition, generation and work, and even interest in the future, and that although they have no organs to carry the senses as in a vessel, they nevertheless possess hearing, smell, taste, and those outstanding gifts of nature, intelligence, brain, science, into the bargainwho would easily believe this? I admit that they have not got blood, as even land animals have not all got blood of the same kind; but just as in the sea the black fluid of the cuttlefish takes the place of blood, as also does the famous juice of the genus purple-fish that supplies a dye, similarly also whatever is the life-giving fluid possessed by insects, this will be their blood. Finally let each man form his own opinion, but our purpose is to point out the manifest properties of objects, not to search for doubtful causes.

3. So far as is perceptible, insects do not appear to possess sinews or bones or spines or cartilage or fat or flesh, and not even a fragile rind, such as some sea creatures have, nor anything that can properly be termed a skin, but a substance of a nature intermediate between all of these, as it were dried up, softer in the sinew but harder or rather more durable in all the other parts. And this is all that they possess, and nothing else in addition; they have no internal organs except, in the case of quite a few, a twisted intestine. Consequently when torn asunder they display a remarkable tenacity of life, and the separate parts go on throbbing, because whatever their vital principle is it certainly does not reside in particular members but in the body as a wholeleast of all in the head. and this alone does not move unless it has been torn off with the breast. No other kind of creature has a greater number of feet, and of this species the ones that have more feet live longer when torn asunder, as we see in the case of the multipede. But they possess eyes, and also of the other senses touch and taste, and some have smell as well, and a few hearing also.

4. But among all of these species the chief place belongs to the bees, and this rightly is the species; chiefly admired, because they alone of this genus have been created for the sake of man. They collect honey, that sweetest and most refined and most health-giving of juices, they model combs and wax that serves a thousand practical purposes, they endure toil, they construct works, they have a government and individual enterprises and collective leaders, and, a thing that must occasion most surprise, they have a system of manners that outstrips that of all the other animals, although they belong neither to the domesticated nor to the wild class. Nature is so mighty a power that out of what is almost a tiny ghost of an animal she has created something incomparable! What sinews or muscles can we match with such efficacy and industry as that of the bees? What men, I protest, can we rank in rationality with these insects, which unquestionably excel mankind in this, that they recognize only the common interest? Not raising the question of breath, suppose we agree as to their possessing even blood; yet what a tiny quantity can there

be in these tiny creatures! After these points let us estimate their intelligence.

5. In winter insects go into retirement for whence could they obtain strength to endure frost and snow and the blasts of the north wind?all species alike, no doubt, but not for so long a period the ones that hide in our house-walls .and are warmed earlier than others are. In regard to bees, either seasons or else climates have changed, or previous writers have been mistaken. They go into retirement after the setting of the Pleiades and remain in hiding till after their rise so not till the beginning of spring, as writers have saidand nobody in Italy thinks about hives before the bean is in flower. They go out to their works and to their labours, and not a single day is lost in idleness when the weather grants permission. First they construct combs and mould wax, that is, construct their homes and cells, then produce offspring, and afterwards honey, wax from flowers, bee-glue from the droppings of the gum-producing treesthe sap, glue and resin of the willow, elm and reed. They first smear the whole interior of the hive itself with these as with a kind of stucco, and then with other bitterer juices as a protection against the greed of other small creatures, as they know that they are going to make something that may possibly be coveted; with the same materials they also build wider gateways round the structure.

6. The first foundations are termed by experts commosis, the second pissoceros, the third propolis, between the outer cover and the wax, substances of great use for medicaments. Commosis is the first crust, of a bitter flavour. Pissoceros comes above it, as in laying on tar, as being more fluid than wax. Propolis is obtained from the milder gum of vines and poplars, and is made of a denser substance by the addition of flowers, and though not as yet wax it serves to strengthen the combs; with it all approaches of cold or damage are blocked, and besides it has itself a heavy scent, being in fact used by most people as a substitute for galbanum.
7. Besides these things a collection is made of which some

7. Besides these things a collection is made of which some people call sandarach and others bee-bread; this will serve as food for the bees while they are at work, and it is often found stored up in the hollows of the combs, being itself also of a bitter flavour, but it is produced out of spring dew of trees like the gums. It is obtained in fig treesblacker in colour when an east wind is blowing and of better quality and a reddish colour when north winds blowand in the largest quantity in Greek nut-trees. Menecrates says that it is a flower, but he is the only authority that makes that statement.

8. They make their wax from the flowers of all trees and plants except the sorrel and the echinopod; these are kinds of herbs. It is a mistake to say that esparto grass is also an exception, because a great deal of the honey obtained in the broom-thickets in Spain tastes of that plant. I also think that olives are wrongly excepted, as it is certain that the largest swarms are produced where olive-trees are growing. No harm is done to any kind of fruit. They do not settle even on dead flowers, let alone dead bodies. They work within a range of sixty paces, and subsequently when the flowers in the vicinity have been used up they send scouts to further pastures. If overtaken by nightfall on an expedition they camp out, reclining on their backs to protect their wings from the dew.

9. Nobody must be surprised that love for bees inspired Aristomachus of Soli to devote himself to nothing else for 58 years, and Philiscus of Thasos to keep bees in desert places, winning the name of the Wild Man; both of these have written about them.

10. Their work is marvellously mapped out on the following plan: a guard is posted at the gates, after the manner of a camp; they sleep till dawn, until one bee wakes them up with a double or triple buzz as a sort of bugle-call; then they all fly forth in a body, if the day is going to be finefor they forecast winds and rain, in case of which they keep indoors; and consequently men consider this inaction on the part of the bees as one of the prognostics of the weather. When the band has gone out to its tasks, some bring home flowers in their feet and others water in their mouth and drops clinging to the down all over their body. While the youthful among them go out to their tasks and collect the things mentioned above, the older ones work indoors. Those collecting flowers with their front feet load their thighs, which are covered with scales so as to serve this purpose, and with their beak load their front feet, and when fully loaded return bulging with their burden. Each is received by three or four others who relieve him of his load: for indoors also the duties are dividedsome build, others polish, others bring up material, others prepare food from what is brought to them; for they do not feed separately, so that there shall be no inequality of work or food or time. In building they begin with the vaulting of the hive, and they bring down as it were a web from the top of a loom, with two balks round each square of work, so that some may come in and others go out. The combs hang firmly attached to the upper part and also a little to the sides at the same time, but they do not reach to the floor of the hive; sometimes they are oblong and sometimes round, according as the shape of the hive requires, and occasionally also of both kinds, when two swarms whose members are friendly have different customs. They prop up

combs that are inclined to fall, the party-walls between the pillars being arched from the ground level so as to supply access for the purpose of repairing. The first three rows or so are arranged empty, so that there may not be any obvious temptation to a thief; the last ones are filled fullest with honey; consequently the combs are taken out from the back of the hive. Carrier bees wait for favourable breezes. If a storm arises, they steady themselves with the weight of a little pebble held in their feet; some authorities say that it is placed on their shoulders.

However in a wind against them they fly close to the ground, carefully avoiding the brambles. They keep a wonderful watch on the work in hand; they mark the idleness of any who are slack and chastise them, and later even punish them with death. They are wonderfully clean: they remove everything out of the way and no refuse is left lying among their work; indeed the droppings of those working inside are heaped in one place so that they may not have to retire too far, and they carry them out on stormy days and when work is suspended. When evening approaches, the buzzing inside the hive grows less and less, till one bee flies round as though giving the order to take repose with the same loud buzz with which she woke them, and this in the manner of a military camp; thereupon they all suddenly become quiet.

They build homes for the commonalty first, and for the kings afterwards. If a specially large production of honey is expected, quarters are added for the drones as well; these are the smallest of the cells, but those for the worker-bees themselves are larger.

11. The drones have no stings, being so to say imperfect bees and the newest made, the incomplete product of those that are exhausted and now discharged from service, a late brood, and as it were the servants of the true bees, who consequently order them about, and drive them out first to the works, punishing laggards without mercy. And the drones are of service to the bees not only in work but also when breeding, as their crowd contributes much to their warmth: it is certain that the larger number of drones there has been, the larger production of swarms also occurs. When the honey has begun to ripen, the bees drive the drones away, and falling on them many to one kill them. Moreover this class of bee is only seen in spring. If a drone is stripped of its wings and afterwards thrown back into the hive it itself strips the wings off the others.

12. They build large and splendid separate palaces for those who are to be their rulers, in the bottom of the hive; these project with a protuberance, and if this be squeezed out, no offspring is born. All the cells are hexagonal, each side being made by one of the bee's six feet. None of these tasks are done at a fixed time, but they snatch their duties on fine days. They fill their cells with honey on one or at most two days.

Honey comes out of the air, and is chiefly formed at the rising of the stars, and especially when the Dog-star itself shines forth, and not at all before the rising of the Pleiades, in the periods just before dawn. Consequently at that season at early dawn the leaves of trees are found bedewed with honey, and any persons who have been out under the morning sky feel their clothes smeared with damp and their hair stuck together, whether this is the perspiration of the sky or a sort of saliva of the stars or the moisture of the air purging itself. And would it were pure and liquid and homogeneous, as it was when it first flowed down But as it is, falling from so great a height and acquiring a great deal of dirt as it comes and becoming stained with vapour of the earth that it encounters, and moreover having been sipped from foliage and pastures and having been collected into the stomachs of beesfor they throw it up out of their mouths, and in addition being tainted by the juice of flowers, and soaked in the corruptions of the belly, and so often transformed, nevertheless it brings with it the great pleasure of its heavenly nature.

13. It is always of the best quality where it is stored in the calyces of the best flowers. This takes place at Hymettus and Hybla in the region of Attica and of Sicily, which are sunny localities and also on the island of Calydna. But at the start it is honey dluted as it were with water, and in the first days it ferments like must and purifies itself, while on the twentieth day it thickens and then is covered with a thin skin which forms from the foam of the actual boiling. The best kind and that least stained with the foliage is sucked from the leaves of the oak and lime and of reeds.

14. Indeed it is constituted on a supreme principle of excellence, as we have said, in a variety of ways. In some places honeycombs distinguished for their wax are formed, as in Sicily and the Abruzzi, in other places for quantity of honey, as in Crete, Cyprus, Africa, in others for size, as in the northern countries, a comb having before now been seen in Germany that was 8 ft. long, and black in its hollow part. Yet in any region there are three kinds of honey. There is spring honey with the comb made from flowers, which is consequently called flower-honey. Some people say this ought not to be touched, so that a progeny made strong by plentiful nourishment may be produced; but others leave less of this honey than of any other kind for the bees, on the ground that a great profusion follows at the rising of the great stars, and

also at the solstice, when thyme and grapevines begin to flower, the outstanding material for the cells. It is however necessary to practice economy in taking away the combs, as lack of food causes the bees to despair and die or fly away, and on the other hand a large supply brings sloth, and then the bees feed on the honey and not on bee-bread; consequently the more careful beekeepers leave a fifteenth part of this vintage to the bees. The day fixed for beginning by a sort of law of nature, if only men would know or keep it, is the thirtieth after the leading out of the swarm; and this vintage usually falls within the month of May.

The second kind of honey is summer honey, the Greek name for which consequently is 'ripe honey,' because it is produced in the most favourable season, when the dog-star is shining in its full splendour, about thirty days after midsummer. In respect of this, immense subtlety on the part of nature has been displayed to mortals, did not man's dishonesty spoil everything with its banefulness. For after the rising of each star, but particularly the principal stars, or of a rainbow, if rain does not follow but the dew is warmed by the rays of the sun, not honey but drugs are produced, heavenly gifts for the eyes, for ulcers and for the internal organs. And if this substance is kept when the dog-star is rising, and if, as often happens, the rise of Venus or Jupiter or Mercury falls on the same day, its sweetness and potency for recalling mortals' ills from death is equal to that of the nectar of the gods.

15. Honey is obtained more copiously at full moon, and of thicker substance in fine weather. In all honey the portion that has flowed by itself like must and olive oilit is called honey-vinegaris the most commendable. All summer honey is reddish, as it has been made in a comparatively dry period. White honey is not made where there is thyme, but honey made from thyme is thought most suitable for the eves and for ulcersit is of a gold colour and has an extremely agreeable taste. The fat honey from violets and the thick kind from rosemary can be seen to condense, but honey that thickens is least praised. Honey from thyme does not condense, and when touched sends out very thin threads, which is the first proof of goodness; it is considered a mark of poor quality for the drops to break off at once and fall back. The next test is for it to have a fragrant scent and a sweet taste leaving a tang, and to be sticky and transparent. Cassius Dionysius holds that a tenth part of the summer honey-crop should be left to the bees, if the hives were full, and that if they were not, a proportionate amount should be left, or if they were empty, they should not be touched at all. The population of Attica have given the first ripening of the wild fig as the regnal for this vintage, but others say Vulcan's holy day.

A third, very little valued, kind of honey is wild honey. called heath-honey. It is collected after the first autumn rains, when only the heath is in flower in the woods, and consequently it resembles sandy honey. It is produced mostly by the rise of Arcturus after September 12. Some people advance the summer honey-making to the rise of Arcturus, since that leaves fourteen days to the autumnal equinox and in the forty-eight days from the equinox to the setting of the Pleiades heath is most plentiful. The Athenian name for it is tetralice, and the Euboean sisyrus, and they believe it to be very acceptable to bees, perhaps because at that season there is no other supply for them. Consequently this honey-gathering is roughly in the period between the end of vintage and the setting of the Pleiades on November 13. Reason advises leaving two-thirds of the honey then procured for the bees, and always the parts of the combs that contain bee-bread. In the sixty days from midwinter to the rising of Arcturus they live on sleep, without any food; in the warmer period from the rising of Arcturus to the spring equinox they now keep awake, but still keep inside the hive and have recourse to the food kept for this time. But in Italy they do the same after the rising of the Pleiades, sleeping till then. Some people in taking out the honey weigh the hives, so separating the amount to be left behind. There is indeed a bond of equity even in the case of bees, and it is said that if the partnership is defrauded the hives perish. Consequently it is one of the first rules that people must wash themselves clean before they take the honey: also bees hate scurf, and women's menstruation. When honey is being removed it is very useful for the bees to be driven away by smoke, so that they may not get angry or greedily devour it themselves. Also denser smoke is employed to arouse their sloth to their tasks, for if they have not gone on incubating, the combs they make are discoloured. On the other hand excessive smoke kills them, as honey very quickly undergoes deterioration if turned sour by the least touch of moisture; and for this reason among the kinds of honey there is a special sort called by the Greek word meaning 'smokeless.

16. There has been a great deal of minute enquiry among the learned as to the manner in which bees reproduce their species; for sexual on to. intercourse among them has never been observed. A majority of authorities have held the view that the offspring are formed in the mouth, by blending together blossoms of the reed and the olive; some think it is by copulation with a single male which in each swarm is called the king; and that this is the only male, and is of exceptional size, so as not to grow weary; and that consequently offspring is not produced without him, and the rest of the bees accompany him as women accompany a husband, not as their leader. This view, though probable on other grounds, is refuted by the production drones; for what reason can there be why the same act of union should engender some perfect offspring and others imperfect? The former opinion would be nearer to the truth, were it not that again another difficulty meets us: it is a fact that sometimes larger bees are born in the extremities of the combs which drive away all the rest. This mischievous creature is called a gadflybeing born in what possible manner if the female bees themselves shape it? One certain fact is that they sit on their eggs in the way that hens do. The offspring hatched at first looks like a white maggot, lying crosswise and sticking so closely to the wax that it seems to be part of it. The king is from the start of the colour of honey, as if made from a special blossom chosen out of the whole supply, and is not a maggot but has wings from the start. The remaining throng when they begin to take shape are called pupae, while the sham ones are called sirens or drones. If anybody takes the heads off specimens of either kind before they have wings, they serve as very acceptable food for their mothers. As time goes on they give them drops of food and sit on them, buzzing more than at any other time, with the object, it is thought, of producing the warmth needed for hatching out the grubs, until they break the membranes that enclose each of them like eggshells and the whole band emerges. This was observed at Rome on the suburban estate of a certain ex-consul, who had hives made of the transparent horn of a lantern. The brood grows up in about six weeks. In some hives what is called a wart is formed, a hard lump of bitter wax, when the bees have not produced offspring out of the comb, owing to disease or sloth or natural infertility; this is the bees' form of abortion. But as soon as they are hatched out they get to work with their mothers under some sort of tuition, and the youthful king is escorted by a retinue of his peers. Several kings are begun to be produced, so that there may not be a lack of them; but afterwards, when the offspring sprung from these has begun to be grown up, by a unanimous vote they kill the worst of them so that they may not divide up the forces. They are of two kinds, the better sort red and the inferior kind black or speckled. All of them are always exceptionally well-formed and twice as large as the others: their wings are shorter, their legs straight, their bearing more lofty, and they have a spot on their brow that shines white in a kind of fillet; they also differ from the common herd a great deal by their brilliant colour.

17. Now let somebody raise the questions whether Hercules was one person and how many Father Libers there were and all the other puzzles buried beneath the litter of antiquity! Here on a trifling matter connected with our own countryhouses, a thing constantly in evidence, there is no agreement among the authorities the question whether the king bee alone has no sting and is armed only with the grandeur of his office, or whether nature has indeed bestowed one upon him but has merely denied him the use of it. It is a well established fact that the ruler does not use a sting. The commons surround him with a marvellous obedience. When he goes in procession, the whole swarm accompanies him and is massed around him to encircle and protect him, not allowing him to be seen During the rest of the time, while the people are engaged in labour, he himself goes the circuit of the works inside, with the appearance of urging them on, while he alone is free from duty. He is surrounded by certain retainers and lictors as the constant guardians of his authority. He only issues abroad when the swarm is about to migrate; intelligence of this is given long before, as a buzzing noise has been going on for some days in the hive, a sign of their preparation while they are selecting a suitable day. If anybody should cut off one of his wings, the swarm would not run away. When they have started, each one wants to be next him and delights to be seen on duty; when he is tired they support him with their shoulders, and carry him entirely if he is more completely exhausted. Any bee that falls out from weariness or happens to stray from the main body, follows on by scent. Wherever the king alights is the camping place of the whole body.

18. Moreover they supply private and public portents when a cluster of them hangs suspended in houses and temples, portents that have often been expiated by great events. They alighted on the mouth of Plato even when he was still an infant, portending the charm of that matchless eloquence; and they alighted in the camp of General Drusus on the occasion of the very successful battle of Arbaloas there are certainly exceptions to the interpretation of the augurs, who invariably think this a direful portent. The capture of the leader holds up the whole body, and when they have lost him they separate and migrate to other lords; in any case they are unable to be without a king. But when the kings have become too numerous they reluctantly destroy them, and by preference they destroy their homes while they are being born. If a supply of honey is despaired of, then they even drive away the drones. Nevertheless I see that there is a doubt about these also, and that some persons think them to form a breed of their own. like the robber-bees, the largest in size among the drones but black and with a broad belly, which have this designation

because they steal and devour the honey. It is certain that the drones are killed by the bees; at all events they do not have a king in the same way as the other bees do; but whether they are born without a sting is a doubtful point.

Bees breed better in a damp spring, but produce more honey in a dry one. If there is a dearth of food for some hives, they make a raid on their neighbours for the purpose of plunder; but the bees attacked form in line of battle to resist, and if the beekeeper is present whichever side thinks that he favours it does not attack him. They also often fight battles for other reasons, and form in two opposing lines under two commanders, the chief source of quarrel arising while they are collecting flowers, and each party calling out their friends; but the combat can be entirely scattered by some dust being thrown on it or by smoke, while a reconciliation can be effected by some milk or water sweetened with honey.

19. There are also wild and forest bees, which are of a bristly appearance, and are much more irascible but of superior industry and diligence. Domesticated bees are of two kinds; the best are short and speckled and of a compact round shape, and the inferior ones are long and have a resemblance to wasps, and also the worst among them are hairy. In Pontus there is a white kind that makes honey twice in a month; and in the neighbourhood of the river Thermodon there are two kinds, one that makes honey in trees and the other that makes it underground in a threefold arrangement of combs. and is most lavishly productive.

Nature has given bees a sting attached to the stomach, designed for a single blow: certain persons think that when they have planted their sting they at once die, while some hold that this only occurs if it is driven in so far that some of the gut follows it, but that afterwards the bees are drones and do not make honey, as though their strength had been castrated, and they cease at the same time both to hurt and to benefit. There is a case of a horse being killed by bees. Bees hate foul smells and flee far away from them, even those not due to natural causes; consequently they attack people scented with perfumes. They themselves are liable to injuries from very many creatures. Wasps and hornets which are degenerate species of the same nature attack them, as also do the species of gnat called mule-flies. Swallows and some other birds ravage them. Frogs lie in wait for them when they are getting water, which is their most important task at the period when they are producing offspring. And not only the frogs that beset ponds and rivers but also toads come of their own accord and crawling up to the doorways blow through them; thereupon the guard flies out and is immediately snapped up; and it is said that frogs do not feel a bee's sting. Sheep too are the enemies of bees, which with difficulty disentangle themselves from their wool. Also the smell of crabs being boiled near them is fatal to them.

20. Moreover bees suffer diseases due to their own nature. A symptom of these is a gloomy torpidity, both when they are brought out before the doorway into the warmth of the sun and food is served to them by others and when they die and the others carry them out and escort their obsequies in the manner of persons conducting a funeral. When this pestilence carries off the king the commons mourn with abject grief, not collecting food and not going out of the hive; they only mass themselves round his body with a sorrowful buzzing. Consequently the throng is separated and he is taken away from it; otherwise they keep gazing at his lifeless body and never stop mourning. Then also, unless help is brought to them, they die of hunger. Consequently their health is judged by their gaiety and brightness.

There are also diseases that affect their work: when they do not fill the combs full, it is called claron, and blapsigonia, if they do not bring their offspring to maturity.

21. Also an echo is detrimental to bees with its repercussion that alarms them by striking them with an alternating blow; fog too is detrimental. Also spiders are in the highest degree hostile; when they have succeeded in weaving a web over the combs they kill the grubs. Even the moth, that cowardly and ignoble creature that flutters up to lamps when they are lit, brings disaster, and not in one way only, for it both devours the combs itself and leaves excrement from which grubs are produced; also wherever it walks it weaves a covering of cobwebs chiefly made from the down on its wings. Moreover moths are born in the wood itself that specially attack the combs. And another bane is their greed for food, as their belly is moved, specially in the spring time, by their devouring a surfeit of flowers. Olive oil indeed kills not only bees but all insects, especially if they are placed in the sun after their head has been anointed. Sometimes also they themselves cause their own death, by greedily devouring honey when they perceive that it is being taken away, whereas normally they are extremely thrifty and make a practice of driving away wasteful and greedy bees just the same as lazy and slothful ones. Also their own honey is noxious to them, and if it is smeared on their backs they die. To so many foes and so many disastersand how small a fraction of them I am recounting!is this beneficent creature exposed. The remedies we will speak of in their proper places; for at present we are discussing their nature

22. They delight in the clash and clang of bronze, and collect together at its summons; which shows that they also possess the sense of hearing. When their work is done and their brood reared, though they have accomplished all their duty they nevertheless have a ritual exercise to perform, and they range abroad in the open and soar on high, tracing circles in flight, and only when this is finished do they return to take food. Their life at longest, granted that hostile attacks and accidents are encountered successfully, lasts seven years. It is stated that the hives have never lasted in their entirety beyond ten years. Some people think that dead bees come to life again if they are kept indoors in winter and then exposed to the heat of the sun in spring and kept warm with hot fig-wood ashes:

23. but that when entirely lost they can be restored by being covered with fresh ox-paunches together with mud, or according to Virgil with the dead body of bullocks, just as wasps and hornets are brought to life from horses' bodies and beetles from those of asses, since nature can change some things from one kind into another. But all these creatures are seen to pair, and nevertheless their offspring possess almost the same nature as that of bees.

24. Wasps make their nests high up, of mud, and in them make cells of wax; hornets make them in caverns or underground; all of these have hexagonal cells, and make their combs of bark, like spiders' webs. The actual offspring are not uniform but varyone flies out while another is in the pupa and another in the grub; and all of these stages are in the autumn, not the spring. They grow chiefly at full moon. The wasps called ichneumon-fliesthey are smaller than the otherskil lone kind of spider called phalangium and carry them to their nests and then smear them over, and from these by incubating produce their own species. Moreover they all feed on flesh, contrary to bees which never touch a body. But wasps hunt larger flies and after cutting off their heads carry away the rest of the body.

The forest variety of hornets live in hollow trees, hibernating in winter like the rest of insects; they do not live beyond the age of two. Their sting is rarely not followed by fever. Some authorities state that twenty-seven a hornetstings will kill a human being. Another kind that seems less fierce has two classesworkers, smaller in size, which die in winter, and mothers, which last two years: these are not fierce at all. They make nests in spring, usually with four entrances, in which to breed the workers. When these have been reared, they then make other larger nests, in which they may now produce those who are to be mothers. Then the workers begin to function and feed the mothers. The mothers are of a wider shape, and it is doubtful whether they possess stings, because they do not come out. These also have their drones. Some people hold the view that all these insects lose their stings towards winter. Neither the hornet nor the wasp kind have kings, nor do they swarm, but their numbers are continually renewed by offspring.

25. Among these is a fourth genus, the silk-moth, which occurs in Assyria; it is larger than the kinds mentioned above. Silk-moths make their nests of mud like a sort of salt; they are attached to a stone, and are so hard that they can scarcely he pierced with javelins. In these nests they make combs on a larger scale than bees do, and then produce a bigger grub.

26. These creatures are also produced in another way. A specially large grub changes into slit, a caterpillar with two projecting horns of a peculiar kind, and then into what is called a cocoon, and this turns into a chrysalis and this in six months into a silk-moth. They weave webs like spiders, producing a luxurious material for women's dresses, called silk. The process of unravelling these and weaving the thread again was first invented in Cos by a woman named Pamphile, daughter of Plateas, who has the undeniable distinction of having devised a plan to reduce women's clothing to nakedness.

27. Silk-moths are also reported to be born in the island of Cos, where vapour out of the ground creates life in the blossom of the cypress, terebinth, ash and oak that has been stripped off by rain. First however, it is said, small butterflies are produced that are bare of down, and then as they cannot endure the cold they grow shaggy tufts of hair and equip themselves with thick jackets against winter, scraping together the down of leaves with the roughness of their feet; this is compressed by them into fleeces and worked over by carding with their claws, and then drawn out into woofthreads, and thinned out as if with a comb, and afterwards taken hold of and wrapped round their body in a coiled nest. Then (they say) they are taken away by a man, put in earthenware vessels and reared with warmth and a diet of bran, and so a peculiar kind of feathers sprout out, clad with which they are sent out to other tasks; but tufts of wool plucked off are softened with moisture and then thinned out into threads with a rush spindle. Nor have even men been ashamed to make use of these dresses, because of their lightness in summer: so far have our habits departed from wearing a leather cuirass that even a robe is considered a burden! All the same we so far leave the Assyrian silk-moth to women

28. To these may be not ineptly joined the nature of spiders, which deserves even exceptional admiration. There are several kinds of spiders, but they need not be described, as they are so well known. The name of phalangium is given to a kind of spider that has a harmful bite and a small body of variegated colour and pointed shape, and advances by leaps and bounds. A second species of spider is black, with very long fore legs. All spiders have legs with two joints. Of the wolf-spiders the smallest do not weave a web, but the larger ones live in the ground and spin tiny ante-rooms in from of their holes. A third kind of the same species is remarkable for its scientific method of construction; it sets up its warp-threads, and its own womb suffices to supply the material needed for this considerable work, whether because the substance of its intestines is thus resolved at a fixed time, as Democritus holds, or because it has inside it some power of producing wool: with such careful use of its claw and such a smooth and even thread it spins the warp, employing itself as a weight. It starts weaving at the centre, twining in the woof in a circular round, and entwists the meshes in an unloosable knot, spreading them out at intervals that are always regular but continually grow less narrow. How skilfully it conceals the snares that lurk in its chequered net! How unintentional appears to be the density of the close warp and the plan of the woof, rendered by a sort of scientific smoothing automatically tenacious! How its bosom bellies to the breezes so as not to reject things that come to it! You might think the threads had been left by a weary weaver stretching in front at the top; but they are difficult to see, and, like the cords in hunting-nets, when the quarry comes against them throw it into the bosom of the net. With what architectural skill is the vaulting of the actual cave designed! and how much more hairy it is made, to give protection against cold! How distant it is from the centre, and how its intention is concealed, although it is really so roofed in that it is impossible to see whether somebody is inside or not! Then its strengthwhen is it broken by the winds? what quantity of dust weighs it down? When the spider is practising its art and learning to weave, the breadth of the web often reaches between two trees and the length of the thread stretches down from the top of the tree and there is a quick return right up the thread from the ground, and the spider goes up and brings down the threads simultaneously. But when a catch falls into the web, how watchfully and alertly it runs to it! although it may be clinging to the edge of the net, it always runs to the middle, because in that way it entangles the prey by shaking the whole. When the web is torn it at once restores it to a finished condition by patching it. And spiders actually hunt young frogs and lizards, first wrapping up their mouth with web and then finally gripping both lips with their jaws, giving a show worthy of the amphitheatre when it comes off. Also auguries are obtained from the spider: for instance, when the rivers are going to rise they raise their webs higher; also they weave their web in fine weather and reweave it in cloudy weather, and consequently a number of spiders' webs is a sign of rain. People think that it is the female that weaves and the male that hunts, and that thus the married pair do equal shares of service.

29. Spiders couple with the haunches, and produce grubs resembling eggsfor their mode of reproduction also must not be deferred, as insects have scarcely any other method; and they lay them all into their webs, but scattered, because they jump about and lay them in the process. The phalangium spiders only incubate in the actual cave a large number of grubs which when hatched out devour the mother, and often the father too, for he helps to incubate. They produce broods of as many as three hundred, whereas all the other kinds produce fewer; and they sit on the eggs three days. They take four weeks to become full-grown spiders.

30. Land scorpions also like spiders produce grubs resembling eggs and die in the same way as spiders; they are a horrible plague, poisonous like snakes, except that they inflict a worse torture by despatching the victim with a lingering death lasting three days, their wound being always fatal to girls and almost absolutely so to women, but to men only in the morning, when they are coming out of their holes, before they emit their vet unsated poison by some accidental stroke. Their tail is always engaged in striking and does not stop practising at any moment, lest it should ever miss an opportunity; it strikes both a sideway stroke and one with the tail bent up. Apollodorus states that these insects emit a white poison, and he divides them into nine kinds, chiefly by their colours, a superfluous task, since he does not let us know which he pronounces to be the least deadly. He says that some have a pair of stings, and that the males are fiercestfor he attributes coupling to these creaturesbut that they can be recognized by their long slender shape; and that all are poisonous at midday, when they have got hot from the warmth of the sun, and also that when they are thirsty they cannot have their fill of drinking. It is also agreed that those with six joints in the tail are more savagefor the majority have five. This curse of Africa is actually given the power of flight by a south wind, which supports their arms when they spread them out like oars; Apollodorus before mentioned definitely states that some possess wings. The Psylli tribe, who by

importing the poisons of all the other countries for their own profit have filled Italy with foreign evils, have tried to bring these creatures here also, but they have proved unable to live this side of the climate of Sicily. Nevertheless they are sometimes seen in Italy, though these are harmless, and in many other places, for instance in the neighbourhood of Pharos in Egypt. In Scythia they kill even pigs, which normally are exceptionally immune to such poisons, black pigs indeed more quickly, if they plunge into water. For a human victim the ashes of the creatures themselves drunk in wine are thought to be a cure. It is thought that to be dipped in oil is a great disaster to geckoes as well as scorpions; but geckoes at least are harmless; these too are bloodless, and are shaped like a lizard; equally scorpions are believed to do no harm whatever to any bloodless creatures. Some think that they also devour their own offspring, and that only one is left, a specially clever one that by perching on his mother's haunches secures himself by this position against both her tail and her bite; and that this one is the avenger of the rest, as he finally kills their parent with a blow from above. They are produced in broods of eleven.

31. These geckoes in a certain manner have the nature of chameleons, living only on dew and on spiders as well.

32. The life-history of the cicada is similar. Of this there are two kinds: the smaller ones that come out first and perish latestthese however are mute; subsequent is the flight of those that sing: they are called Singers, and the smaller ones among them grass-hoppers, but the former are more vocal. The males in either class sing, but the females are silent. These creatures are used as food by the Eastward races, even the Parthians with their abundant resources; they prefer the males before mating and the females afterwards, being seduced by their eggs, which are white. They couple lying on their backs. They have a very sharp prickliness on the back, with which they hollow a place in the ground for their offspring. This is produced first as a grub, and then from this comes what is called the larva; at the period of the solstices they break the shell of this and fly out, always at night; at first they are black and hard. This is the only living creature actually without a mouth; they have instead a sort of row of prickles resembling tongues, this also being on the breast, with which they lick the dew. The breast itself forms a pipe: the singers use this to sing with, as we shall say. For the rest, there is nothing on the belly. When they are disturbed and fly away, they give out moisture, which is the only proof that they live on dew; moreover they are the only creatures that have no aperture for the bodily excreta. Their eyes are so dim that if anybody comes near to them contracting and straightening out a finger. they pass by as if it were a leaf flickering. Some people make two other classes of tree-crickets, the twig-cricket which is the larger, and the corn-cricket, which others call the oat-cricket, because it appears at the same time as the crops begin to dry. Tree-crickets do not occur where trees are scarceconsequently they are not found at Cyrenae except in the neighbourhood of the townnor in plains or in chilly or shady woods. These creatures also make some difference between localities; in the district of Miletus they occur in few places, but there is a river in Cephallania which makes a boundary with a few of them on one side and many on the other; again in the Reggio territory they are all silent but beyond the river in the region of Locri they sing. They have the same wing-structure as bees, but larger in proportion to the body.

33. Of insects some have two wings, for instance, flies, and some four, for instance bees. The tree-cricket also flies with its membranes. Those armed with a sting in the belly have four wings, but none having a weapon in the mouth has more than two wings to fly with, for the former have this weapon bestowed on them for the sake of vengeance but the latter for the purpose of greed. No insects' wings when torn off grow again. None that has a sting in the belly is two-winged.

34. In some species the wings are protected by an outer covering of shell, for instance beetles; in these species the wing is thinner and more fragile. They are not provided with a sting, but in one large variety of them there are very long horns, with two prongs and toothed claws at the point which close together at pleasure for a bite; they are actually hung round children's necks as amulets; Nigidius calls these Lucanian oxen. Another kind of them again is one that rolls up backwards with its feet vast balls of mud and nests its brood of little grubs in these against the rigour of winter. Others flutter about with a loud murmur or a shrill noise, and others giving out a buzz bore numerous holes in hearths and walls in the night. Glow worms shine like fires at night time owing to the colour of their sides and loins, now giving a flash of light by opening their wings and now darkened by closing them; they are not much seen before the crops are ripe or after they have been cut. The cockroaches' life on the contrary is a nurseling of the shadows, and they fly the light, being mostly produced in the damp warmth of bathhouses. The reddish and very large beetles of the same kind dig dry earth and mould combs that resemble a small porous sponge and contain poisoned honey. There is a small place near Olynthus in Thrace that is fatal to this animal, and is consequently called Beetle-bane. The wings of all insects have

n no cleft. None has a tail except the scorpion. This is the only insect that has arms, and also a spike in the tail; some of the rest have a sting, for instance the gadfly (or if you like, 'breeze'), and also the gnat and some flies, but with all of these it is in the mouth and settles as a tongue. With some these stings are blunt, and do not serve for pricking but for suctionfor instance with a sort of fly, in which the tongue is evidently a tube; and this sort of insect have no teeth. Others, a for instance butterflies, have useless little horns projecting in front of their eyes. Some insects, for instance the centipede,

have no wings. 35. Insects that have feet can move sideways. Of some, for instance locusts, the hind feet are longer and curve outward.

Locusts in the autumn season give birth to clusters of eggs, by lowering the tube of the prickle to the earth. The eggs last for the winter, but in the ensuing year at the end of spring send out small insects, that are blackish and have no legs, and crawl with their wing-feathers. Consequently spring rains kill the eggs, whereas in a dry spring there are larger broods. Others record that they have two breeding seasons and two seasons when they die offbearing at the rise of the Pleiades and then dying at the rise of the Dog-star, others being born in their place; some say that this second brood is born at the setting of Arcturus. It is certain that the mothers die when they have given birth to a brood, a maggot immediately forming inside them in the region of the throat that chokes them. The males die at the same time. And although dying for such a trifling reason a single locust when it likes can kill a snake by gripping its throat with its teeth. They are born only in places with chinks in them. There are said to be locusts in India three feet long, with legs and thighs that when they have been dried can be used as saws. They also have another way of dying: they are carried away in swarms by the wind and fall into the sea or a marsh. This happens purely by accident and not, as was believed by ancient writers, owing to their wings being drenched by the dampness of night. The same people indeed have also stated that they do not fly by night because of the coldnot being aware that they cross even wide seas, actually, which is most surprising, enduring several days' continuous hunger, to remedy which they know how to seek fodder abroad. This plague is interpreted as a sign of the wrath of the gods: for they are seen of exceptional size, and also they fly with such a noise of wings that they are believed to be birds, and they obscure the sun, making the nations gaze upward in anxiety lest they should settle all over their lands. In fact their strength does not fail, and as though it were not enough to have crossed the seas, they pass over immense tracts of land and cover them with a cloud disastrous for the crops scorching up many things with their touch and gnawing away everything with their bite, even the doors of the houses as well.

Italy is infested by swarms of them, coming principally from Africa, the Roman nation having often been compelled by fear of dearth to resort to remedies prescribed by the Sibylline Books. In the district of Cyrene there is actually a law to make war upon them three times a year, the first time by crushing the eggs, then the grubs and last the fully grown insects, with the penalty of a deserter for the man who shirks. Also in the Island of Lemnos there is a rule prescribing a definite quantity of locusts killed that each man has to bring in to the magistrates. Also they keep jays for this purpose, which meet them by flying in the opposite direction, to their destruction. In Syria as well people are commandeered by military order to kill them. In so many parts of the world is this plague abroad; but with the Parthians even the locust is an acceptable article of diet.

The locust's voice appears to come from the back of the head: it is believed that in that place at the juncture of the shoulderblades they have a sort of teeth, and that they produce a grating noise by rubbing them together, chiefly about the two equinoxes, as grasshoppers do about midsummer. Locusts couple in the same manner as all insects that pair, the female carrying the male with the end of her tail bent back to him, and with slow separation. In all this class the males are smaller than the females.

36. Most of the insects give birth to a maggot; ants for example produce in spring one that resembles an egg, these too sharing their labour as do bees, but bees make the food stuffs, whereas ants collect theirs. And if anybody compared the loads that ants carry with the size of their bodies, he would confess that no creatures have proportionally greater strength; they carry them held in their mouths, but they move larger loads with their hind feet, turning their backs to them and heaving against them with their shoulders. Ants also have a system of government, and possess memory and diligence. They nibble their seeds before they store them away, so that they may not sprout up again out of the earth and germinate; they divide the larger seeds so as to get them in: when they have been wetted by rain they bring them out and dry them. They even work at night when there is a full moon, although when there is no moon they stop. Again what industry and what diligence is displayed in their work! and since they bring their burdens together from opposite directions, and are unknown to one another, certain days are assigned for market

so that they may become acquainted. How they flock together on these occasions! How busily they converse, so to speak, with those they meet and press them with questions! We see rocks worn by their passage and a path made by their labours, so that nobody may doubt how much can be accomplished in any matter by even a trifling amount of assiduity! They are the only living creatures beside man that bury their dead.Winged ants do not occur in Sicily.

The horns of an Indian ant fixed up in the Temple of Hercules were one of the sights of Erythrae. These ants carry gold out of caves in the earth in the region of the Northern Indians called the Dardae. The creatures are of the colour of cats and the size of Egyptian wolves. The gold that they dig up in winter time the Indians steal in the hot weather of summer, when the heat makes the ants hide in burrows; but nevertheless they are attracted by their scent and fly out and sting them repeatedly although retreating on very fast camels: such speed and such ferocity do these creatures combine with their love of gold.

37. Many insects however are born in other ways as well, and in the first place from dew. At the beginning of spring this lodges on the leaf of a radish and is condensed by the sun and shrinks to the size of a millet seed. Out of this a small maggot develops, and three days later it becomes a caterpillar, which as days are added grows larger; it becomes motionless, with a hard skin, and only moves when touched, being covered with a cobweb growthat this stage it is called a chrysalis. Then it bursts its covering and flies out as a butterfly.

38. In this way some creatures are generated from rain in the earth and some even in wood. For not only is the goatmoth caterpillar born in wood, but also the horse-fly springs from wood, and other creatures, wherever there is excessive damp,

39. just as tapeworms thirty feet in length, sometimes even more, grow inside a human being. Again worms are born in the flesh of dead bodies and also in the hair of living people, a foul growth that caused the death of the dictator Sulla and also of one of the most famous of Greece poets, Alernan. This indeed also infests birds, and actually kills pheasants unless they sprinkle themselves with dust: and of hairy animals it is believed that only the ass and sheep are immune from this evil. They also breed in one kind of clothing especially, woollen made from sheep that have been killed by wolves. Also I find in the authorities that some springs of water in which we bathe are specially productive of this kind of creature; inasmuch as even wax generates what is believed to be the smallest of animals. Others again are generated out of dirt by the rays of the sun, creatures that hop with a frisk of their hind legs, and others out of damp dust, that fly about in caves.

40. There is an animal belonging to the same season that always lives with its head fixed in the blood of a host, and consequently goes on swelling, as it is the only animal that has no vent for its food; with gorging to excess it bursts, so dying of its very nutriment. This creature never grows in carthorses but occurs frequently in oxen and occasionally in dogs in which all creatures breed, whereas this alone occurs in sheep and goats. Equally remarkable is the thirst for blood that is even felt by leeches in marshy water; for they too penetrate with the whole of their head. Dogs have a special pest of their own, a maggot that lances particularly, their ears, which they cannot protect by their bite.

41. Similarly, dust in woollens and in clothes breeds moths, especially if a spider is shut up with them; for being thirsty and sucking up all the moisture it increases the dryness. This is also noticed in papers. There is a kind of moths that carry their own coats in the same way as snails; but the moths have visible feet. If stripped of their coats they die, but if they grow up. they form a chrysalis. The wild fig-tree breeds fig-gnats; beetles are produced by the maggots of figs and of the pear tree, pine, dog-rose and rose. This poisonous creature brings its remedies with itthe wings have a healing power; but with these removed it is deadly. Again, other kinds, namely gnats, are bred by a substance growing sour, and in fact white ones are found even in snow, and also in snow that has been lying for some time maggots, which in a moderate depth of snow at all events are ruddyfor even snow itself turns reddish with lapse of time; these have shaggy hair and are of considerable size, and torpid.

42. Some creatures are generated also by the opposite natural element. Thus in the copper foundries of Cyprus even in the middle of the fire there flies a creature with wings and four legs, of the size of a rather large fly; it is called the pyrallis, or by some the pyrotocon. As long as it is in the fire it lives, but when it leaves it on a rather long flight it dies off.

43. The river Bug on the Black Sea at midsummer brings down some thin membranes that look like berries out of which burst a four-legged caterpillar in the manner of the creature mentioned above, but it does not live beyond one day, owing to which it is called the hemerobius. The rest of this sort of creatures have from start to finish seven-day periods, but the gnat and maggots have twenty-one-day, and those whose offspring are fully formed twenty-eight-day periods. Their changes and transformations into other shapes take place every three or every four days. The remaining kinds of this class possessing wings usually die in autumn of decay of the wings, but horseflies die of blindness also. When flies have been killed by damp they can be resuscitated by being buried in ashes.

44. Now let our investigation treat of the various parts of bodies besides the ones already mentioned, taking limb by limb.

All creatures that have blood have a head. On the head a few kinds, and these only birds, have crests, of different sorts it is truewith the phoenix it is a row of feathers spreading out from the middle of the head in a different direction, peacocks have bushy tufts, the bird of Stymphalus a crest, the pheasant little horns, as moreover has the small bird that was formerly named from this peculiarity the crested lark and subsequently was called by the Gallic word alauda and gave that name also to the legion so entitled. We have also said which bird has been endowed by nature with a folding crest. Nature has also bestowed a crest that slopes backwards from the beak down the middle of the neck on the coot species, and also a tufted crest on Mars's woodpecker and on the Balearic crane, but she has given the most distinguished decoration to the poultrycockits fleshy, notched comb; and this cannot rightly be described as flesh or gristle or hard skin, but is a gift peculiar to it: for no one can be found who has ever seen serpents' crests.

45. Many of the water and marine and snake species are furnished in various ways with horns of a sort, but horns in the proper sense of the term only belong to the genus quadrupeds; for I deem the story of Actaeon, and also that of Cipus in the history of Latium, to be fabulous. And in no other field does nature allow herself more sport; with the weapons of animals she has made a gamedividing some into branches, for instance, the horns of stags; assigning simple horns to others, for instance, the species in the same genus called from this feature 'flute-stags,' spreading those of others into palms and making fingers shoot ont from these, the origin of the designation 'broad-horn.' To goats she has given branching but small horns, and these she has not made to be shed; to the ram class horns twisted into a crooked shape, as if providing them with weighted gauntlets for boxing; to bulls horns for attackingin this class indeed she has also bestowed horns on the females, although in many she only gives them to the males; to chamois horns curved over the back, to antelopes horns curved the opposite way; but to the crook-horn, the African name for which is addax, upright horns twisted with a coil of wrinkles and sharpened at the end into a smooth point, so as to make them suitable for lyres: also horns that are movable, like ears, to the cattle of Phrygia; horns pointing towards the ground to those belonging to the Cave-dwellers, which consequently graze with the neck bent sideways; to other creatures a single horn, and this placed in the middle of the head or between the nostrils, as we have said; moreover some have strong horns for charging, others for striking; some horns curved forward, some backward, some for tossing in various wayscurving backward, curving together, curving outward; all ending in a point; in one kind horns used instead of hands for scratching the body; with snails used for exploring the way in advancethese fleshy, as those of the homed snake: these creatures sometimes have one horn, snails always two, so as both to be stretched forward and to spring back.

The northern barbarians use the horns of the aurochs for drinking, and fill the two horns of a single head with wine; others point their spears with horn tips. With us horn is cut into transparent plates to give a wider diffusion to a light enclosed in it, and it is also applied to many other articles of luxury, sometimes dyed, sometimes painted, sometimes what is called from a certain kind of picture 'engraved.' All animals' horns are hollow and solid solely at the tip, but only stags have horns that are entirely solid and that are shed every year. Farmers heal the hooves of their oxen when worn by greasing the horn of the hoof with fat; and the substance of horn is so ductile that even the horns of living cattle can be bent with boiling wax, and they can be slit at birth and twisted in opposite directions, so as to produce four horns on one head.

The females usually have thinner horns, as is the case with many in the cattle class, but the females of sheep and of stags have none, nor have those of the animals with cloven hooves, nor any of those with solid hooves except the Indian ass that is armed with a single horn. Nature has bestowed two horns on the kinds with cloven hooves, but on no kind having front teeth in the upper jaw: but those who think that the material to form upper teeth is entirely used up in horns are easily refuted by the nature of does, which have no teeth that stags have not also and nevertheless have no horns. The horns of all other kinds are attached to the bones, but those of stags alone grow out of the hide.

46. The heads of fishes are very large in proportion to their bodies, perhaps so as to enable them to dive. The shell-fish kind have no heads, nor have sponges nor virtually any of the other creatures which only possess the sense of touch. Some kinds, for instance crabs, have the head not separated from the body.

47. Of all the animals man has most hair on the head: indeed this is the case indiscriminately with males and females, at all events with the races that do not cut the hair; and the Longhair tribes of the Alps and Gallia Comata have actually derived their names from this, though nevertheless there is in this respect some difference between countries: in fact the people of Mykoni are born devoid of hair, like the persons with an affection of the spleen at Caucus. (Also some kinds of animals are bald by nature, for instance ostriches and cormorants; the Greek name for the latter is derived from this peculiarity.) With these races loss of the hair is rare in the case of a woman and unknown in eunuchs, and never occurs in any case before sexual intercourse has taken place; and they are never bald below the brainpan or the crown of the head, or round the temples and the ears. Man is the only species in which baldness occurs, except in cases of animals born without hair, and only with human beings and horses does the hair turn grey, in the former case always starting at the forehead and only afterwards at the back of the head.

48. In human beings only a double-crowned skull occurs in some cases. The bones of the human skull are flat and thin and have no marrow; they are constructed with iuterlockings serrated like the teeth of a comb. When broken they cannot form again, but the removal of a moderate piece is not fatal, as its place is taken by a scar of flesh. The skull of the bear is the weakest and that of the parrot the hardest, as we have stated in the proper place.

49. All blooded animals have a brain, and so also have the sea-creatures that we have designated the soft species, although they are bloodless, for instance the polypus [octopus]. Man however has the largest brain in proportion to his size and the most moist one, and it is the coldest of all his organs; it is wrapped in two membranes above and below, the fracture of either of which is fatal. For the rest a man's brain is larger than a woman's. With all human beings it has no blood or veins, and in some cases no fat. The learned teach that it is distinct from marrow because boiling makes it hard. In the middle of the brain of all species there are tiny little bones. With man alone the brain throbs in infancy, and does not become firm before the child first begins to talk. The brain is the highest of the organs in position, and it is protected by the vault of the head: it has no flesh or blood or refuse. It is the citadel of sense-perception, and the focus to which all the flow of the veins converges from the heart and at which it stops; it is the crowning pinnacle, the seat of government of the mind. But the brain of all animals slopes forward, because our senses also stretch in front of us. It is the source of sleep and the cause of drowsy nodding; species without a brain do not sleep.

Stags are stated to have maggots to the number of twenty in the head beneath the hollow of the tongue and in the neighbourhood of the juncture of the head with the neck.

50. Only man is unable to move the ears. (The family surname Flabby comes from them.) Also women spend more money on their ears, in pearl earrings, than on any other part of their person; in the East indeed it is considered becoming even for men to wear gold in that place. Some animals have larger and others smaller ears; only stags have cleft and as it were divided ears; the shrewmouse has shaggy ears; but all species, at all events viviparous ones, have some ears, except the seal and dolphin, and those which we have designated a cartilaginous, and vipers: these have only holes in place of ears. except the cartilaginous species and the dolphin, although the latter is obviously able to hear; for dolphins are charmed even by music, and are caught while bewildered by the sound. Their precise method of hearing is a riddle. They also have no indications of smell, although they possess a very keen scent. Of feathered creatures only the eagle-owl and eared owl have feathers that serve as ears, the rest have apertures for hearing; and similarly with the scaly creatures and with snakes. In horses and every kind of cattle the ears display signs of their feelings, drooping when they are tired, twitching when they are frightened, pricked up when they are angry and relaxed when they are sick.

51. Only man has a face, all other animals have a muzzle or beak. Others also have a brow, but only with man is it an indication of sorrow and gaiety, mercy and severity. The eyebrows in man can be moved in agreement with it, either both together or alternately, and in them a portion of the mind is situated: with them we indicate assent and dissent, they are our chief means of displaying contempt; pride has its place of generation elsewhere, but here is its abode: it is born in the heart, but it rises to the eyebrows and hangs suspended therehaving found no position in the body at once loftier and steeper where it could be sole occupant.

52. Beneath the brows lie the eyes, the most precious part of the body and the one that distinguishes life from death by the use it makes of daylight. Not all animals have these organs: oysters have no eyes, and some of the shellfish doubtful ones, as scallops, if somebody moves his fingers towards them when they are open, shut up as though seeing them, and razor-shells hurry away from iron hooks brought near them. Of fourfooted creatures moles have no sight, although they possess the semblance of eyes if one draws off the covering membrane. And among birds the variety of the heron class called in Greek white herons are said to lack one eye, and to be a very good omen when they IIy North or South, as they tell that dangers and alarms are being dissipated. Nigidius says that also locusts and cicadas have no eyes. For snails their pair of horns all the place of eyes by feeling in front of them. Earth-worms also and worms in general have no eyes.

53. Man alone has eyes of various colours, whereas with all other creatures the eyes of each member of a species are alike. Some horses too have grey eyes; but in man the eyes are of extremely numerous variety and differencelarger than the average, medium, small; prominent, which are thought to be dimmer, or deep-set, which are thought to see most clearly, as are those with the colour of goats' eyes.

54. Moreover some people have long sight. but others can only see things brought close to them. The sight of many depends on the brilliance of the sun, and they cannot see clearly on a cloudy day or after sunset; others have dimmer sight in the day time but are exceptionally keen-sighted at night. We have already said enough about double pupils, or persons who have the evil eye. Blue-grey eyes see more clearly in the dark. It is stated that Tiberius Caesar alone of all mankind was so constituted that if he woke up in the night for a short time he could see everything just as in bright daylight, although darkness gradually closed over him. The late lamented Augustus had grey eyes like those of horses, the whites being larger than usual in a human being, on account of which he used to be angry if people watched his eyes too closely: Claudius Caesar's eves were frequently bloodshot and had a fleshy gleam at the corners; the Emperor Gaius had staring eyes; Nero's eyes were dull of sight except when he screwed them up to look at objects brought close to them. In the training-school of the Emperor Gaius there were 20,000 gladiators, among whom there were only two that did not blink when faced by some threat of danger and were consequently unconquerable: s6 difficult it is for a human being to stare steadily, whereas for most people it is natural to keep on blinking, and these are traditionally supposed to be more cowardly. Nobody has eyes of only one colour: with everyone the general surface is white but there is a different colour in the middle. No other part of the body supplies greater indications of the mindthis is so with all animals alike. but specially with manthat is, indications of self-restraint, mercy, pity, hatred, love, sorrow, joy. The eyes are also very varied in their lookfierce, stern, sparkling, sedate, leering, askance, downcast, kindly: in fact the eyes are the abode of the mind. They glow, stare, moisten, wink; from them flows the tear of compassion when we kiss them we seem to reach the mind itself, they are the source of tears and of the stream that bedews the cheek. What is the nature of this moisture that at a moment of sorrow flows so copiously and so promptly? Or where is it in the remaining time? In point of fact it is the mind that is the real instrument of sight and of observation; the eyes act as a sort of vessel receiving and transmitting the visible portion of the consciousness. This explains why deep thought blinds the eves by withdrawing the vision inward. and why when the mind is clouded during an attack of epilepsy the eyes though open discern nothing. Moreover hares sleep with the eyes wide open, and so do many human beings while in the condition which the Greeks term 'corvbantic.'

Nature has constructed them with thin and multiple membranes, and with outside wrappers that are callous against cold and heat, which she repeatedly cleanses with moisture from the tear-glands, and she has made the eyes slippery against objects that encounter them, and mobile.

55. The horny skin in the centre of the eye nature has furnished with the pupil as a window, the narrow opening of which does not allow the gaze to roam uncertain, but so to speak canalizes its direction, and easily averts objects that encounter it on the way; the pupil is surrounded with circles which with some people are coloured black, with others grey and with others blue, so that the light from the surrounding radiance both may be received in a suitable blend and having its reflexion moderated may not be jarring; and the efficacy of the mirror is made so perfect by these means that the small pupil can reflect the entire image of a human being. This is the reason why commonly birds when released from men's hands go first of all for their eyes, because they see their own likeness reflected in them and try to reach as it were a desired object that is akin to themselves. Beasts of burden only experience diseases at certain phases of the moon. Man alone is cured of blindness by the emission of fluid from the eye. Many have had their sight restored after 20 years of blindness; some have been blind at birth owing to no defect in the eyes; similarly, many have suddenly lost their sight without any previous injury. The most learned authorities state that the eyes are connected with the brain by a vein; for my own part I am inclined to believe that they are also thus connected with the stomach: it is unquestionable that a man never has an eye knocked out without vomiting. There is a solemn ritual custom among Roman citizens to close the eyes of the dying and to open them again on the funeral pyre, custom having established that it is not right for the eyes to be seen by a human being at the last

moment and also wrong for them not to be displayed to the heavens. Man is the only animal whose eves are liable to distortion, which is the origin of the family names Squint-eye and Blinky. From the eyes also came the name of One-eye that used to be given to persons born blind in one eye, and that of Eyelet given to persons both of whose eyes were small; the One-eye family a received the name of an injury done to one of them. The eyes of night-roaming animals like cats shine and flash in the dark so that one cannot look at them, and those of the wild-goat and the wolf gleam and shoot out light; the eyes of the sea-calf and of the hyena change frequently into a thousand colours; moreover those of many fishes shine out even in the dark, like oak-tree stumps when dry and rotten with age. We have stated that creatures that do not direct their gaze by slanting the eves but by turning the head round do not wink. It is reported that the chameleon's eyes turn themselves entirely round. Crabs look sideways, having their eyes enclosed in a fragile shell. Lobsters and shrimps mostly have very hard eyes projecting under a protection of the same kind. Creatures with hard eyes have less keen sight than those whose eves are moist. It is stated that if one removes the eves of young snakes and swallow chicks, they grow again. The eyes of all insects and of creatures with a covering of shell move like the ears of quadrupeds. Those with fragile coverings have hard eyes. All such creatures, and also fish and insects, have no eyelids and do not close their eyes; withal the eye is covered with a membrane that is transparent like glass

56. Human beings have eyelashes on both eyelids. Women actually have them dyed every day: such is their desire to achieve beauty that they colour even their eyes; but really the lashes were bestowed by nature for another purpose, as a sort of fence to the sight and a barrier projecting against insects meeting the eye, or other things accidentally falling into them. It is said that sexual excess causes them to drop off, not undeservedly. None of the other species have them excepting those with hair on the rest of the body as well, but quadrupeds have them only on the upper lid, birds on the lower, as also do creatures with a soft skin, for instance snakes, and oviparous quadrupeds, for instance lizards. The ostrich is the only bird with lashes on both eyelids like a human being.

57. Not all species have eyelids either, and also only viviparous creatures can wink. The heavier birds close the eye with the lower lid, and also wink with a skin that covers the eye from the corner. Pigeons and similar birds close the eyes with both lids. But oviparous quadrupeds, such as tortoises and crocodiles, do so only with the lower lid, without any winking because their eyes are extremely hard. The old name for the edge of the upper eyelid was cilium; hence our word for the brows. When the eyelid is cleft by a wound it does not grow together again, as is the case with a few other parts of the human body.

58. Only man has cheeks below the eyes (the old word for the cheeks was genae, used in the Twelve Tables in the prohibition of women's lacerating them). The cheeks are the seat of modesty: on them a blush is most visible.

59. The face between the cheekbones displays merriment and laughter, and higher up, but in man only, stands the nose, which modern fashion has made the organ of sly mockery. No other animal has projecting nostrils, birds, snakes and fishes only having apertures for smelling, without nostrils and this is the origin of the surnames Snubby and Pug. Seven-month children have frequently been born lacking the apertures of the ears and nostrils.

60. The viviparous species have lipswhence the surnames Lippy and Blubber-lipsand a well-shaped or rather harsh mouth. Instead of ups birds have pointed beaks of horn, which are hooked in birds of prey, straight in those that live by pecking, and broad in those that dig up grass and mud, like the snouts of the swine class. Cattle use their mouths instead of a hand for gathering fodder. Beasts that live by tearing up their prey have mouths that open wider.

No creature but man has a chin, any more than cheeks. The crocodile moves only the upper jaw; four-footed laud animals open the mouth in the same way as all other creatures and in addition move the lower jaw sideways.

61. There are three kinds of teethserrated or continuous or projecting: serrated teeth closing together like the teeth of a comb, so as not to be worn away by direct collision, as in snakes, fishes and dogs; continuous, as in man and the horse; projecting, as in the boar, hippopotamus and elephant. Of continuous teeth those that separate the food (incisors), are called the broad or sharp teeth, those that masticate it double teeth, and those between these dog-teeth. The latter are longest in creatures with serrated teeth. Continuous teeth are either in both jaws, as with the horse, or else there are no front teeth in the upper jaw, as with oxen and sheep and all the ruminants. The goat has no upper teeth except the pair in front. Species having serrated teeth have no projecting teeth, and a female rarely has them, and when she has them does not use them; consequently though boars gore, sows bite. No species with horns has projecting teeth, but all have curved ones; all the other species have solid teeth. All kinds of fish have serrated teeth except the parrot-fishthis is the only aquatic species that has level teeth. Many of them however

have teeth on the tongue and all over the mouth, so as to soften by means of a multiplicity of wounds objects that they are unable to reduce by mastication. Many also have teeth on the palate [and also on the tail] and also turned further into the mouth, so as to prevent morsels of food from falling out, as they have no apparatus for retaining it.

62. The asp and serpent have similar teeth, but two extremely long ones on the right and left side of the upper jaw, perforated by a slender tube like the stings of the scorpion. which inject poison. The most accurate authorities write that this poison is nothing else than the serpents' gall, and that veins pass from the gall-bladder under the spine to the mouth; certain writers say that it is only one tooth, and that as it is hooked it is sloped backward when it has inflicted a bite: some authorities state that it then falls out and afterwards grows again, as it is very easy to dislodge, and that the snakes that we see handled lack this tooth; and that the scorpion has this tooth in its tailas according to most authorities it has three. The vipers' teeth are concealed in its gum. Their gum is charged with the same poison, and when squeezed by the pressure of the teeth pours out its venom into the bites inflicted. No winged creature except the bat has teeth. The camel is the only animal without horns that has not got front teeth in the upper jaw. No horned animal has serrated teeth. Even snails have teeth; this is proved by the fact that even the smallest of them gnaw vetches. But I wonder what possible ground there is for the view that among marine species shellfish and cartilaginous fish have front teeth, and also that seaurchins have five. Insects have stings instead of teeth. The monkey has teeth like those of a human being. The elephant has four inner teeth for masticating, and besides these the prominent tusks that are bent backward in the male and slope straight downward in the female. The sea-mouse that swims in front of the whale has no teeth, but instead of them its mouth inside and also its tongue and palate are set with bristles. Of land animals very small quadrupeds have two extremely long front teeth in each jaw.

63. All the other animals are born with teeth, but man grows them six months after birth. All the rest keep their teeth permanently, but man, the lion, the beasts of burden, dogs and ruminant animals shed them; with the lion and dog however this only applies to those called dog-teeth. The right dog-tooth of a wolf is held to be valuable as an amulet. No animal sheds its maxillary teeth, the ones next to the dogteeth. In man those called wisdom-teeth grow latest, at about the age of twenty, and in many cases even at eighty, with females as well, but only in the case of persons who did not grow them in youth. It is certain that in old age they fall out and then grow again. Mucianus has stated that he saw a Samothracian named Zocles who grew a new set of teeth when 110 years old. For the rest, males have more teeth than females in the case of man, ox, goat and pig. Timarchus son of Nicocles at Paphos had two rows of maxillaries; his brother did not shed his front teeth, and consequently wore them down. There is a case of a person even growing a tooth in the palate. Any of the dog teeth lost by some accident never grow again. With all other species the teeth get red in old age, but in the horse alone they become whiter.

64. In beasts of burden the teeth are a sign of their age. A horse has forty teeth; when two-and-a-half years old it loses two front ones in each jaw, and in the following year the same number of the teeth next these, when they are replaced by those called grinders; at the beginning of its fifth year it looses two teeth, which grow again in its sixth year; in its seventh year it has all of its second teeth and also its permanent ones. A horse previously gelt does not shed its teeth. The ass family likewise looses teeth when two-and-ahalf years old, and again six months later; those that have not foaled before they shed their last teeth are sure to be barren. Oxen change their teeth at the age of two. Pigs never shed theirs.

When this indication has come to an end, old age in horses and other beasts of burden is inferred from prominence of the teeth and greyness of the brows and hollows round them, when they are judged to be about sixteen years old.

Human teeth contain a kind of poison, for they dim the brightness of a mirror when bared in front of it and also kill the fledglings of pigeons. The rest of the facts about the teeth have been told in the passage dealing with human reproduction. Infants when cutting their teeth are specially liable to illnesses. The animals with serrated teeth have the severest pain in teething.

65. Not all species have tongues on the same plan. With snakes the tongue is extremely slender and three-forked, darting, black in colour, and if drawn out to full length extremely long; with lizards it is cleft in two and hairy, and with seals also it is double; but with the species above mentioned it is of the fineness of a hair. With the rest it is available for licking round the jaws, but with fish it adheres through a little less than its whole length, and with crocodiles the whole of it. In aquatic species on the other hand the fleshy palate serves instead of the tongue in tasting. With lions, leopards, and all the species of that genus, even cats, the tongue is rough and corrugated like a file, and can scrape

away the human skin by licking, which provokes even those that have been tamed to madness when their saliva gets through to the blood. We have spoken of the tongues of the purple-fishes. In frogs the tip of the tongue is attached but the inner part is loose from the throat; it is with this that the males croak, at the time when they are called croakers; this happens at a fixed season, when they are calling the females to mate. In this process they just drop the lower lip and take into the throat a moderate amount of water and let the tongue vibrate in it so as to make it undulate, and a croaking sound is forced out; during this the curves of the cheeks are distended and become transparent, and the eyes stand out blazing with the exertion. Creatures with stings in their hinder part have teeth and a tongue as well, bees even a very long tongue, and cicalas also a projecting one: but those with a tubular sting in the mouth have neither tongue nor teeth. Some insects have a tongue inside the month, for instance ants; moreover, the elephant's tongue also is particularly little visible. With the rest of the animals according to theft kind the tongue is always quite free, but with man alone it is often so tightly bound by veins that they have to be cut. We find it recorded that the High Priest Metellus was so tongue-tied that he is believed to have suffered torture for many months while practising the formula to be spoken in dedicating the Temple of Wealth; but in all other cases of stammering the patient usually contrives to speak distinctly after reaching the age of six. Many people on the other hand are endowed with such skill in using the tongue that they can give imitations of the cries of birds and animals that are indistinguishable from the real thing.

With all the other species the tip of the tongue is the seat of taste, but with man this is also situated in the palate.

66. Man has tonsils, the pig glands. Man alone has what is called the uvula hanging from the back of the palate between the tonsils. No oviparous species possesses the lesser tongue below the uvula. Its functions are twofold, placed as it is between two, tubes. Of these the inner one called the windpipe stretches to the lungs and the heart; this the lesser tongue closes while food is being eaten, as breath and voice passes along it, lest if drink or food should pass into the wrong channel, it might cause pain. The other, the outer tube, is of course called the gullet, down which food and drink fall; this leads to the stomach, and the stomach to the abdomen. This passage the lesser tongue occasionally closes, when only breath or voice is passing, so that an untimely rising of the stomach and flesh, the gullet of sinew and flesh.

67. No species except those possessing both windpipe and gullet have a nape; all the others, which have only a gullet, have a neck. But in those possessing a nape it is composed of a number of bones articulated in rings with jointed vertebrae, so as to be capable of bending to look round; only in the lion and wolf and hyena is it a stiff structure of a single straight bone. Moreover it is connected with the spine, and the spine with the loins, in a bony but rounded structure, the marrow passing down from the brain through the orifices in the vertebrae. It is inferred that the spinal cord is of the same substance as the brain for the reason that, if its extremely slender membrane is merely cut into, death follows immediately. Species with long legs also have long necks; as also have aquatic species even though they have short legs, and similarly if they have hooked claws.

68. Man and swine alone suffer from swollen throat, usually due to bad drinking water. The top part of the gullet is called the pharynx and the bottom part the stomach. This name denotes the cavity attached to the spine below the fleshy part of the windpipe, bulging out lengthwise and breadthwise like a flagon. Species without a pharynx, for instance fishes, have no stomach either, and no neck nor throat, and the mouth is joined to the abdomen. The sea tortoise has not got a tongue or teeth, but breaks up all its food with the point of its snout. Next comes the windpipe and the stomach, denticulated with ridges of thick skin like bramble-thorns for the purpose of grinding up the food, the interstices growing smaller in proportion as they are nearer to the abdomen: at the bottom it is as rough as a carpenter's raso.

69. The heart with the other animals is in the middle of the chest, but in man alone it is below the left breast, with its conical end projecting forward. In fishes only it points towards the mouth. It is stated that at birth the heart is the first organ formed in the womb, and next the brain, just as the eves develop latest, but that the eves are the first to die and the heart the last. The heart is the warmest part. It has a definite beat and a motion of its own as if it were a second animal inside the animal; it is wrapped with a very soft and firm covering of membrane, and protected by the wall of the ribs and chest, so that it may give birth to the principle cause and origin of life. It provides the vital principle and the blood with their primary abodes inside it, in a winding recess which in large animals is three-fold and in all others without exception double; this is the dwelling-place of the mind. From this source two large veins run apart to the front and the back of the body, and diffuse the blood of life through other smaller veins with a spreading system of branches to all the

limbs. The heart alone is not tortured by the defects of the inner organs; and it does not prolong the torments of life, and when wounded at once brings death. When the rest of the parts have been injured vitality continues in the heart.

70. The view is held that dull creatures are those whose heart is stiff and hard, bold ones those whose heart is small, and cowardly ones those in which it is specially large; but it is largest in proportion to their size in mice, the hare. the ass. the stag, the leopard, weasels, hyenas, and all the species that are either timid or rendered dangerous by fear. Partridges in Paphlagonia have two hearts. Bones are occasionally found in the heart of horses and oxen. The people of Egypt, who practise the custom of mummification, have a belief that the human heart grows larger every year and at the age of fifty reaches a weight of a quarter of an ounce, and from that point loses weight at the same rate; and that consequently a man does not live beyond a hundred, owing to heart failure. It is stated that some people are born with a hairy heart, and that they are exceptionally brave and resolutean example being a Messenian named Aristomenes who killed three hundred Spartans. He himself when severely wounded and taken prisoner for, the first time escaped through a cave from confinement in the quarries by following the routes by which foxes got in. He was again taken prisoner, but when his guards were fast asleep he rolled to the fire and burnt off his thongs, burning his body in the process. He was taken a third time, and the Spartans cut him open alive and his heart was found to be shaggy.

71. In victims whose organs are propitious there is a certain fatness on the top of the heart. But the heart was not always considered as one of the significant organs; it was after the 126th Olympiad, when Lucius Postumius Albinus, son of Lucius, was King of Sacrifices, after King Pyrrhus had evacuated Italy, that the augurs began to inspect the heart among the organs. On the day when Caesar as dictator first went in procession dressed in purple and took his seat on a golden throne, when he performed a sacrifice the heart was lacking among the organs; and this gave rise to much debate among the students of divination, as to whether the victim had been able to live without that organ or had lost it at the time. It is stated that at the cremation of persons who have died of heart disease the heart cannot be burnt, and the same is said of persons that have been killed by poison; undoubtedly there is extant a speech of Vitellius that employs this argument to prove Gnaeus Piso guilty of poisoning, and explicitly uses the evidence that it had been impossible to cremate the heart of Germanicus Caesar on account of poison. In reply Piso's defence was based on the nature of the disease

72. Below the heart are situated the lungs, the breathing apparatus, drawing in and sending back the breath, and consequently spongy in substance and perforated with empty tubes. As has been said, few aquatic species possess lungs, and in the oviparous species they are small and contain froth, not blood; consequently these species do not experience thirst. The same cause makes it possible for frogs and seals to stay long under water. Also the lungs of the tortoise, although very large and spreading under the whole of its shell, are nevertheless devoid of blood. The speed of a creature's movement varies inversely with the size of its lungs. The chameleon's lungs are extremely large in proportion to its size, and it has no other internal organ.

73. The liver is on the right hand side: it contains what is called the head of the internal organs, which varies a great deal. Marcus Marcellus, near the time of his death, when he was killed by Hannibal, found the liver missing among the organs, but on the following day a double liver was discovered. The liver was also missing with Gaius Marius when he offered sacrifice at Utica, and also with the Emperor Gaius on January 1 at the commencement of his consulship in the year of his murder, and with his successor Claudius in the month in which he was poisoned. When the late lamented Augustus was sacrificing at Spoleto on the first day he was in power the livers of six victims were found with the bottom of their tissue folded back inward, and this was interpreted to mean that he would double his power within a year. It is also of gloomy omen when the head of the liver is accidentally cutexcept at a period of trouble and alarm, when it removes anxieties. Hares with two livers are found in the district of Briletum and Thames and in the Chersonese on the Sea of Marmara, and surprising to say, when the animals are moved to another place one of the two livers disappears.

74. The liver also contains the gall-bladder, but not all animals possess one. At Chalcis in Euboea the cattle have none, while at Naxos they have a very large double one, so that both facts seem portentous to a stranger. Horses, mules, asses, stags, wild goats, boars, camels and dolphins have not got one; some mice have. Among human beings few lack one; those who do are exceptionally strong in health and long-lived. Some think that the horse has a gall-bladder not indeed in the liver but in the belly, and that the stag has one in the tail or in the bowels, and that consequently they have such a bitter flavour that dogs will not touch them. But as a matter of fact it is only excrement, and because of this the substance of this part also contains the worst portion of the blood. Unquestionably only sanguineous animals possess a liver. The liver receives the blood from the heart with which it is connected, and passes it into the veins.

75. But with a human being black gall contains the cause of insanity, and when it is all excreted death follows. Hence the reproach made against a man's character under the term 'bile': so powerful a poison is contained in this part when it spreads to the mind. Moreover when it is diffused all over the body it takes away the colour even of the eves, and indeed, when excreted, even from bronze vessels, which turn black when touched by itso that nobody need be surprised that snakes' gall is poison. (Animals in the Pontus that eat wormwood are free from bile.) Again the gall-bladder is connected with the kidneys and only on one side with the intestine in ravens, quails and pheasants, and in some only with the intestine, as in pigeons, the hawk, lampreys; and with a few birds it is in the liver. With snakes it is proportionally extremely copious, and so with fishes. But with birds it usually fills the whole intestine, as with the hawk and kite; moreover it is also in the liver, as in the case of all the large marine animals. Indeed in the case of seals it is in high repute for many purposes as well. From bulls' gall a golden colour is extracted. The augurs have consecrated the gall to Neptune and the power of the watery element, and the late lamented Augustus found a double gallbladder on the day on which he won the battle of Actium.

76. It is said that the filaments in the tiny livers of mice correspond with the number of the days of the moon in the month, and are found to correspond with its degree of light; and also that they grow larger with winter. Rabbits are often found in Southern Spain with a double set of internal organs. One of the two filaments of toads ants do not touch, because of their poison, as is believed. The liver is extremely capable of enduring age, and has been proved by instances of sieges to last a hundred years.

77. Snakes and lizards have long internal organs. There is a record that when a person at Volterra named Caecina was performing a sacrifice, some snakes darted out from the internal organs of the victima joyful portent; and indeed it would seem nothing incredible to those considering that on the day on which King Pyrrhus died the heads of his victims when cut off crawled about licking up their own blood. In man the chief internal organs are separated from the lower part of the viscera by a membrane which is called the praecordia (diaphragm), because it is stretched prae (in front of) the cor (heart): the Greek word for it is phrenes. Indeed provident Nature has enclosed all the principal internal organs with special membranes serving as sheaths; but in the case of this membrane a special cause also was the proximity of the bowels, to prevent the food from pressing down on the vital principle. To this membrane unquestionably is due the subtlety of the intellect; it consequently has no flesh, but is of a spare sinewy substance. In it also is the chief seat of merriment, a fact that is gathered chiefly from tickling the armpits to which it rises, as nowhere else is the human skin thinner, and consequently the pleasure of scratching is closest there. On this account there have been cases in battle and in gladiatorial shows of death caused by piercing the diaphragm that has been accompanied by laughter.

78. In creatures possessing a stomach the abdomen is below it; it is single in the other species but double in the ruminants. Species without blood have no stomach, because in some, for instance the cuttlefish and the polyp, the intestine beginning at the month bends back to the same point. In man the abdomen is connected with the bottom of the stomach, like the dog's. These are the only animals in which it is narrower at the lower part, and consequently they are the only ones that vomit, because when the abdomen is full this narrowness prevents the food from passing, which cannot happen to those in which the roomy laxity of the abdomen passes the food on to the lower parts.

79. From this abdomen start in the sheep and in man the smaller intestines through which the food passes, and in the other species the entrails, from which the roomier intestines pass to the belly, and in the case of man in extremely winding coils. On this account species in which the distance from the belly is longer arc greedier for food; moreover those with a very fat abdomen are less clever. Birds also in some eases have two receptacles, one down which food just eaten passes to the throat, the other into which they pass the food from the throat when digestede.g. hens, ring-doves, pigeons and partridges. Almost all the other species in most cases have not got this, but make use of a more widely opened gullet, for instance jays, ravens and crows. Some species treat the food in neither manner, but have the abdomen very near; these are species that have specially long and narrow necks, for instance the sultana-hen. The abdomen of whole-hoofed annuals is rough and hard. In that of some land animals the roughness is denticulated and in that of others it has a latticed bite Species that are without teeth in both jaws and that do not ruminate digest their food here and pass it down from here into the belly. This in all species is attached at its middle to the navel; in man at its lower part it resembles the belly of a pig; the Greeks call it the colon; it is the seat of a great cause of pain. In dogs it is extremely narrow, and for this reason

they can only relieve it with a violent effort and not without severe pain. The most ravenous animals are those in whom the food passes directly from the abdomen right down the gut; this is the case with lynxes, and among birds cormorants. The elephant has four abdomens, but its other parts resemble those of pigs; its lungs are four times as large as those of an ox. Birds have a fleshy and hard abdomen. In the abdomen of swallow chicks there are found white or red coloured pebbles, called swallow-stones; there are accounts of these in the treatises on magic. Also in the second abdomen of heifers is found a round ball of blackish tufa that weighs nothing; this is thought to be a sovereign remedy for difficulty in childbirth if it has never been allowed to touch the ground.

80. The abdomen and bowels except in the oviparous species are wrapped in a fat thin caul. To this is attached the spleen on the left side opposite the liver, with which it occasionally changes place, but this constitutes a portent. Some think that oviparous species contain a spleen, and also snakes a rather small one; this undoubtedly appears to be so in the case of the tortoise, the crocodile, lizards and frogs. It is certain that the goat's-head bird has not got a spleen, nor have the bloodless species. Sometimes it causes a peculiar impediment in running. owing to which runners who have trouble have an operation to reduce it. Also cases are reported of animals living after it has been removed by an incision. There are some who think that this operation deprives a man of the power of laughing, and that inability to control one's laughter is caused by enlargement of the spleen. It is said that in a district in Asia called Scepsis the cattle have extremely small spleens, and that remedies for the spleen have been imported from there.

81. All viviparous quadrupeds a have kidneys, but among oviparous ones only the tortoise, which has all the other internal organs also, but, as with man, its kidneys resemble those of the ox, and look like a cluster of several kidneys. But at Briletum and Thame stags have four kidneys while the species possessing feathers and scales have none. For the rest, they are attached to the top of the loins. In all cases the right kidney is higher, and not so fat, and drier; but with both the fat is discharged out of the middle, except in the seal. Animals accumulate fat most in the kidneys, sheep indeed with fatal results, because the fat solidifies round them. Occasionally stones are found in the kidneys.

82. Nature has surrounded the heart and the vital parts with the chest, a bony structure, but has made it stop at the abdomen which had to be allowed room to increase in size; no animal has bones round the abdomen. Man alone has a broad chest; with all the other animals it is keel-shaped, more so with birds, and among them most of all with the aquatic species. Man has eight ribs, pigs ten, horned animals thirteen and serpents thirty.

83. Below the belly in front is the bladder, which occurs in none of the oviparous kinds except the tortoise, in none devoid of lungs filled with blood, and in none without feet. Between the bladder and the belly are the tubes called the groin, stretching to the private parts. The bladder of the wolf contains a stone named syrites; but in some human beings there continually form terribly painful stones and bristly fibres. The bladder consists of a membrane that when wounded does not form a solid scar; it is not the same as the one that enfolds the brain or the heart, as there are several kinds of membrane.

84. Women have all the same organs, and in addition. joined to the bladder, a small sac, called from its shape the uterus or womb; another name for it is 'the parts,' and in the rest of the animals it is called the matrix. This in the viper and the viviparous species is double; in the oviparous ones it is attached to the diaphragm; and in women it has two recesses on either side of the flanks, and it causes death whenever it is displaced and interferes with the breathing. It is said that cows when pregnant only carry in the right cavity of the womb, even when carrying twins. Sow's paunch is a better dish after a miscarriage than after a successful delivery; in the former case it is called 'miscarryings' and in the latter 'farrowings.' That of a sow farrowing for the first time is best, and the contrary with those exhausted with breeding. After farrowing the paunch is a bad colour and lacking in fat, unless the sow was killed the same day; nor is that of young sows thought much of, except from those farrowing for the first time, and the paunch of old sows is preferable provided they are not quite worn out, and not killed on the actual day of farrowing or the day before or the day after. The paunch next best to miscarryings is that of a sow slaughtered the day after farrowing; also its paps are the best, provided it has not yet suckled the litter; the paps of a sow that has had a miscarriage are the worst. In old days people called it sow's abdomen before it got hard, as they used not to slaughter sows when they were with young.

85. Horned animals with teeth in one and those that have pastern-bones in the feet put on fat in the form of suet, but in those with cloven hooves or feet divided into toes, and without horns, it forms grease. This is of a solid substance and when it has cooled off can he broken up, and it is always where the flesh ends; whereas fat is between the flesh and the skin, and is moist and fluid. Some animals, for instance the

hare and the partridge, do not grow fat. All fat animals are more liable to barrenness, in the case of both males and females; also excessively fat ones get old more quickly. All animals have some fat in the eyes. In all cases the greasy fat has no sensation, because it does not possess arteries or veins; and in most animals also fatness of condition causes insensitiveness, and it is recorded that because of this pigs have been gnawed by mice while still alive. It is also on record that the son of the consular Lucius Apronius had his fat removed by an operation and relieved his body of unmanageable weight.

86. Marrow also appears to consist of the same substance, being of a red colour in youth and turning white in old age. It is only found in hollow bones, and there is none in the legs of oxen or dogs, in consequence of which when they are fractured the bone does not join again, this being caused by the flow of marrow from a fracture. But the marrow is fat in the animals that contain lard, suety in those with horns, sinewy and only present in the spine in those without bones, like the fish kind; and bears have none, and the lion a rather small amount in a few of the bones of the thighs, and forelegs, while the other bones are so hard that fire can be struck from them as from a flint.

87. Also the animals that do not get fat have hard bones; those of asses are resonant enough to use as flutes. Dolphins being viviparous have bones and not spines, but snakes have spines. Soft aquatic species have no bones, but rings of flesh bound round the body, for instance the two kinds of cnttlefish. Insects also are said to be equally devoid of bones. The gristly aquatic species have marrow in the spine, and seals have gristle, not bones. Similarly with all that have ears and nostrils that just project these are soft and flexible, nature thus insuring them against fracture. When gristle is burst it does not join up, and when bones are amputated they do not grow again, except the bone between the hoof and the hock in beasts of burden. Human beings grow taller to the age of twenty-one and from then onward fill out; but more particularly at the period of puberty they are noticed to get free from a sort of impediment to their growth, and especially so in sickness.

88. The sinews starting from the heart, and in the ox actually wrapped round the heart, have a similar nature and explanation, being in all animals attached to the slippery bones and binding together the links of the bodily frame called joints, in some cases by coming between them, in others by surrounding them and in others by passing from one to another, being at one point rounded and at another flattened as the conformation of the joint requires in each case. The sinews also do not join again if cut, and, what is surprising, though extremely painful if wounded cause no pain at all if cut through. Some animals, for instance fishes, have no sinews, as they are held together by their arteries; although the soft species of the fish genus lack arteries as well. Where there are sinews, the inner ones contract the limbs and the ones on the surface reverse the movement.

89 Between the sinews lie the arteries which are the passages for the breath, and on these float the veins, which are the channels for the blood. The pulse of the arteries being particularly evident at the extremity of the limbs is usually a sign of diseases; with remarkable scientific skill it has been reduced by that high priest of medicine, Herophilus, to definite rhythms and metrical rules throughout the periods of lifesteady or hurried or slow. This sign has been neglected because of its excessive subtlety, but yet really it supplies a rule for the guidance of life by observation of the pulse-beat, rapid or languid. The arteries have no sensation, for they even are without blood, nor do they all contain the breath of life; and when they are cut only the part of the body concerned is paralysed. Birds have not got either veins or arteries, nor yet have snakes, tortoises and lizards, and they have only a very small amount of blood.

The veins spread underneath the whole skin, finally ending in very thin threads, and they narrow down into such an extremely minute size that the blood cannot pass through them nor can anything else but the moisture passing out from the blood in innumerable small drops which is called sweat. The iunction and meeting point of the veins is at the navel.

90. Creatures whose blood is copious and thick are hottempered. The blood of males is darker than that of females, and that of youth than that of old age; and it is thicker in the lower part of the body. The blood also contains a large proportion of vitality, and when shed it draws the breath with it: but it has no sense of touch. The animals with denser blood are braver, those with thinner blood wiser, and those with very little blood, or none at all, more timid. The blood of bulls coagulates and hardens most quickly (and consequently is noxious to drink); that of boars next quickly, but that of stags and goats and antelopes does not thicken at all. Asses have the thickest blood and man the thinnest. Species with more than four feet have no blood. Fat animals have a smaller supply of blood, because it is used up in the fat. In the human race alone a flux of blood occurs in the males, in some eases at one of the nostrils, in others at both, with some people through the lower organs, with many through the mouth; it may occur at a fixed period, as recently with a man of

Copyright © 2018 by Lord Henfield, Guildford Scientific Press PAGE 3494 praetorian rank named Macrinus Viscus, and every year with the City Prefect Volusius Saturninus, who actually lived to be over 90. This alone of the bodily affections experiences an occasional increase, inasmuch as sacrificial victims bleed more copiously if they have previously drunk.

91. Those animals which we have specified as going into hiding at fixed seasons have not any blood at those periods except quite scanty drops in the neighbourhood of the head, by a marvellous contrivance of nature, just as in man she causes the blood-supply to alter at the smallest impulses, the blood not only being suffused with less matter by sleep but at each separate state of mind, by shame, anger, and fear, there being various ways of turning pale, and also of blushingas the blush of anger is different from that of modesty. For it is certain that in fear the blood retreats and is nowhere to be found, and that many creatures do not shed blood when stabbed, which happens only to a human being. For those which we have spoken of as changing their colour really assume the colour of some other object by a sort of reflexion; only man actually changes colour in himself. All diseases and death reduce the amount of blood

92. There are persons who think that subtlety of mind is not due to thinness of the blood, but that animals are more or less brutish owing to their skin and bodily coverings, as for instance molluscs and tortoises; and that the hides of oxen and bristles of pigs obstruct the thinness of the air when being inhaled, and it is not transmitted pure and liquid; so also in man, when his skin being thicker or more callous shuts it outjust as if crocodiles did not possess both a hard hide and cunning.

93. The skin of the hippopotamus is so thick that it is used for the points of spears, and yet its mind possesses a certain medical ability. The hides of elephants also supply impenetrable bucklers (though nevertheless they are credited with the most outstanding mental subtlety of all quadrupeds); and consequently their skin itself is devoid of sensation, especially in the head. It does not heal up when wounded in any place where there is only skin and no flesh, as in the cheek and eyelid.

94. Viviparous species have bristles, but oviparous ones have feathers or scales, or shells like tortoises, or bare skin like snakes. Feathers in all cases have hollow stalks; when cut off they do not grow again, but when plucked out others grow in their place. Insects use fragile membranes to fly with, flying-fish fly over the sea with damp membranes and bats among houses with dry ones; the wings of bats also have joints.

Shaggy hair grows out of a thick skin, whereas women have finer hair: horses have abundant hair in the mane, lions on the shoulders, rabbits on the cheeks inside and also under the feet, hair in both places being also recorded in the case of the hare by Trogus, who infers from this example that among human beings also the hairy ones are more licentious: the hare is the shaggiest animal there is. Man alone grows hair on the private parts, and if this does not occur is sterile, this applying to both sexes. Human beings have some hair at birth and grow some later; the latter does not grow with men who have been castrated, though the hair they had at birth does not fall off; just as women also do not much lose their hair, although there have been cases of women afflicted with baldness, and also with down on the face, when menstruation has ceased. With some men the hair that comes after birth does not grow readily. Four-footed animals shed their hair and grow it again every year. With men the hair of the head grows fastest and next that of the beard. When the hair is cut it does not grow again from the incision, as plants and all other things do, but continues growing from the root. The hair grows longer in some diseases, especially consumption, and in old age too, and also on the bodies of the dead. Licentious people loose the hair they had at birth earlier and grow fresh hair more quickly. With four-footed animals the hair gets thicker with age and the wool thinner. Four-footed animals have shaggy backs and bare bellies.

Boiling ox-hide produces glue; bull's hide makes the best.

95. Man is the only species in which the male has teats; with the rest of the animals there are only the marks of teats. But with the females also only those have teats on the breast that are able to lift their offspring up to them. No oviparous species has teats; and only the viviparous have milk. Among flying species only the bat has milk, as I think the story about screech-owls, that they drop milk from their teats into the mouths of babies, is a fabrication. It is an acknowledged fact that even in old days the screech-owl was one of the creatures under a curse, but what particular bird is meant I believe to be uncertain.

With asses the teats are painful after foaling, and consequently they refuse to suckle their foals after five months, whereas mares give suck almost a whole year. Whole-hooved species that never have more than two foals all have two dugs, and these always between the thighs. Animals with cloven feet and horns have the dugs in the same place, cows having four and sheep and goats two. Those that bear large litters and that have toes on the feet have more dugs, and these in a double row the whole length of the bellyfor instance swine, of which the good breeds have twelve dugs and the common ones

two less; similarly with dogs. Some species have four dugs in the middle of the belly, for instance leopards, others two, for instance lionesses. The elephant has only two dugs beneath the shoulders and not on the breast but close to it, concealed under the shoulder-blades. None of the species with toes have dugs beneath the thighs. Sows give their first dugs to the pigs born first in each litter, these being the dugs nearest to their throats, and each pig in the litter knows its own dug in the order in which it was born, and gets its food from that one and not at another. If its nurseling is taken away from it the dug at once goes dry and shrivels up, whereas if one out of the whole litter is left the dug that had been assigned to it at birth alone hangs down and does service. She-bears carry four dugs Dolphins only have two nipples at the bottom of the belly, which are not prominent and project slightly sideways; and the dolphin is the only animal that gives suck while in motion. But whales and seals also suckle their young.

96. A woman's milk produced before the seventh month is of no use, but from that month, when the embryo is alive, it is healthy. With the females of most species milk flows from the whole of the dugs and even from the fold of the shoulderblades. Camels have milk until they are in foal again: camel's milk is thought to be most agreeable if three parts of water are added to one of milk. A cow does not have milk before calving; and after the first calving there are always biestings, which condense into a sort of foam unless water is mixed with them. Asses in foal begin to give milk at once. Where the pasture is rich it is fatal for their foals to have tasted their mothers' milk in the two days after birth: the name for the illness is biestings-fever. Cheese is not made from species with teeth in both jaws, as their milk does not curdle. Camel's milk is the thinnest and mares' milk the next thin; asses' milk is thickest, so that it is used as a substitute for rennet. Asses' milk is actually thought to contribute something to the whiteness in women's skin: at all events Domitius Nero's wife Poppaea used to drag five hundred she-asses with foals about with her everywhere and actually soaked her whole body in a bathtub with ass's milk, believing that it also smoothed out wrinkles. All milk is made thicker by fire and turned into whey by cold. Cow's milk makes more cheese than goat's milk. almost as much again from the same quantity. Animals with more than four dugs are not serviceable for cheese, and those with two are better.

The curds of the roebuck, hare and goat are praised, but that of the rabbit is the best, and is even a cure for diarrhoeathe rabbit is the only animal with teeth in both jaws that has this property. It is remarkable that the foreign races that live on milk for so many centuries have not known or have despised the blessing of cheese, at most condensing their milk into agreeable sour curds and fat butter. Butter is a foam of milk of thicker and stickier substance than what is called whey; it must be added that it possesses the quality of oil and is used for anointing by all foreigners and by ourselves in the case of children.

97 Of cheese from the provinces the most highly praised at Rome, where the good things of all nations are estimated at first hand, is that of the district of Nimes, coming from the villages of La Lozre and Gvaudan; but it only wins approval for a short time and when fresh. The Alps prove the value of their pastures by two kinds of cheese: the Dalmatian Mountains send the Docleate and the Tarentaise the Vatusic. A larger number belong to the Apennines: these send Coebanum cheese from Liguria, chiefly made of sheep's milk, Sarsina cheese from Umbria, and Luni cheese from the borderland of Tuscany and Liguriathis cheese is remarkable for its size, in fact it is actually made up to the weight of 1000 pounds the cheese; but nearest to Rome is the Vestinian, and the kind from the Caedician Plain is the most approved. Herds of goats also have their special reputation for cheese. in the case of fresh cheese especially when smoke increases its flavour, as with the supremely desirable cheese made in the city itself; for the cheese of the Gallic goats always has a strong medicinal taste. But of cheeses from over seas the Bithynian is quite famous. That pastures contain salt, even where it is not visible, is chiefly detected from the fact that all cheese as it gets old turns saltish, just as cheeses steeped in vinegar and thyme undoubtedly return to their original fresh flavour. It is recorded that Zoroaster in the desert lived for twenty years on cheese that had been so treated as not to be affected by age.

98. Man is the only land two-footed animal, and the only one that has a throat, shoulders instead of forequarters like the others, and elbows. In animals possessing hands, the hands only have flesh inside, the outside consisting of sinews and skin.

99. Some people have six fingers on each hand. It has come down to us that the two daughters of a man of patrician family named Marcus Coranius were called the Miss Six-Fingers on this account, and that Voleatius Sedigitus was distinguished in poetry. The human fingers have three joints and the thumb two, and it bends in the opposite direction to all the fingers, stretching out by itself on a slant, and it is thicker than the others. The thumb is equal to the smallest finger in length, and two of the rest are equal to one another, between them the middle finger extending longest. The fourfooted animals that live by plunder have five toes on the front feet and four on the others. Lions, wolves, dogs and the leopard have five claws on the hind feet as well, with the one next the joint of the leg hanging down; the other species, which are smaller, have five toes also.

100. Not all people's arms are a pair; it is known that a Thracian gladiator named Studiosus in Gaius Caesar's training-school had his right arm longer than his left. Some animals use the service of their front feet as hands, and sit moving their food to their mouth with them, for instance squirrels. In fact the monkey tribes have a perfect imitation of a human being in their face, nostrils, cars and eyelashesthey are the only four-footed animals with eyelasheson the lower lid as well, also paps on the breast, and arms and legs bending similarly in opposite directions, and nails on their hands, and fingers, and a longer middle finger. They differ a little from human beings in their feet, for these are very long like their hands, but make a foot-print like the palm of a hand. They also have a thumb and knuckles like a human being; and besides a genital organ, and this in the males only, they also have all internal organs to pattern.

101. It is believed that nails are the extremities at the end of sinews. All creatures have nails that also have fingers, but in the monkey they overlap like tiles, whereas in man they are broad (and they continue to grow after a man is dead); and they are crooked in beasts of prey but straight in the other animals, for instance dogs; excepting the nail that in most species hangs downward from the leg. All animals with feet have toes, except the elephant; for the elephant's toes are unshaped and though five in number yet undivided and only slightly separated, and resembling hooves, not nails, and the fore feet are larger, the joints of the hind feet being short, and also an elephant's knees bend inward like a man's, whereas the other animals bend the knees of the hind legs in the opposite direction to those of the forelegs; for viviparous animals bend their knees in front of them and the joints of the hocks backward.

102. In man the knees and elbows bend in opposite directions, and the same is the case with bears and the monkey tribe, which are consequently not at all swift. In the oviparous quadrupeds, the crocodile and the lizards, the front knees curve backward and the hind knees forward, but these species have legs that bend like the human thumb; and so also have the multipedes, except the hindermost legs of the species that jump. Birds curve their wings forward.

103. The knees of a human being also possess a sort of religious sanctity in the usage of the nations. Suppliants touch the knees and stretch out their hands towards them and pray at them as at altars, perhaps because they contain a certain vital principle. For in the actual joint of each knee, right and left, on the front side there is a sort of twin hollow cavity, the piercing of which, as of the throat, causes the breath to flow away. There is a religious sanctity belonging to other parts also, for instance in the right hand: kisses are imprinted on the back of it, and it is stretched out in giving a pledge. It was a custom with the Greeks in early days to touch the chin in entreaty. The memory is seated in the lobe of the ear, the place that we touch in calling a person to witness; similarly behind the right ear is the seat of Nemesis (a goddess that even on the Capitol has not found a Latin name), and to it we apply the third finger after touching our mouths, the month being the place where we locate pardon from the gods for our utterances.

104. Varicose veins in the legs occur only in a man but rarely in a woman. Oppius records that Gaius Marius who was seven times consul was the only man who underwent an operation for the removal of varicose veins without lying down.

105. All animals start walking with the right foot and lie down on the left side. Whereas the other animals walk as they like, only the lion and the camel pace with one foot after the other, that is with the left foot not passing but following the right foot. Human beings have the largest feet; the females of all species have more slender feet; man alone has calves and legs that are fleshy. We find it stated in the authorities that a certain person in Egypt had no calves. Man alone has an arched sole to the foot (with some exceptionsa deformity that is the origin of the surnames Flatfoot, Broadfoot, Splayfoot, Swellfoot, just as from the legs come the names Knock-knee, Bowleg, Bandyleg, deformities that also occur in animals). Some animals without horns have solid hooves: consequently in place of horns a kick of the hoof is their weapon. And the same animals have no pastern-bone, but those with cloven hooves have one. Pastern-bones are also lacking in animals having toes, and no animal has them in the forefeet. The camel's pastern-bones resemble those of the ox but are a little smaller; for the camel's foot is divided in two by a very small cleft and is fleshy at the tread like a hear's for which reason a camel's feet are liable to split on too long a journey without shoeing.

106. Only with animals of the draught kind do the hooves grow again. In some places in Illyria pigs have solid hooves. Horned animals mostly have cloven hooves. No species has both solid hooves and two horns; the only animal with one

Copyright © 2018 by Lord Henfield, Guildford Scientific Press PAGE 3495 horn is the rhinoceros, and the only one with one horn and cloven hooves the antelope. The rhinoceros is the only solidhooved animal that has pastern-bones, for pigs are thought to belong to both classes, and consequently their pastern-bones are misshapen. Persons who have thought that a human being has pastern-bones have been easily refuted. Of the animals with toes only the lynx has something resembling a pasternbone, and the lion a still more twisted one. But the true pastern-bone is at the ankle-joint, projecting with a hollow bulge and attached with a ligature onto the joint.

107. Some birds have toes, others are web-footed, and others intermediate, with separate toes but also broad feet; but all have four toes, three in front and one at the heelthe latter however absent in some long-legged species; the wryneck alone has two toes on either side of the foot. The same bird has a tongue like a snake's which it stretches out a long way, and it turns its neck round towards its back; it has large claws like a jay's. Some of the heavier birds, though none of those with crooked talons, have spurs added on the legs. The long-legged birds fly with their legs extended towards their tail, but the short-legged ones draw them into their middle. Those who say that there is no bird without feet assert that black martins have specially short feet, and also the Alpine swift, a bird that is very rarely seen. Even snakes with the feet of geese have been seen before now.

108. The insects with hard eyes have the front feet longer, so that they may occasionally rub their feet eyes with their feet, as we observe in houseflies. Insects with long hind feet leap, for instance locusts. But all these have six feet. Some spiders have two very long feet in addition. Each foot has two joints. We have said that some marine species also have eight feet, octopuses, cuttlefish of both varieties, and crabs, which move their fore-feet in the opposite direction to the others and their hind-feet in a circle or slantwise; they are also the only animals with feet of a rounded shape. All the other species have two guiding feet, only crabs have four. Land species that exceed this number of feet, as most worms, have not less than twelve, and some as many as a hundred. No kind has an odd number of feet.

In the species with solid feet the legs are of the proper size at birth, afterwards more truly stretching out than growing. Consequently in infancy they scratch their ears with their hind feet, which when older they are unable to do, because length of time increases the size of only the surface of their bodies. For this reason at the early stages they can only feed by bending their knees, and this goes on till their neck reaches full growth.

There is a dwarf kind in all species of animals, and even among birds.

109. We have already specified the species of which the males have genital organs behind them. These organs are bony in wolves, foxes, weasels and ferrets, which also furnish sovereign remedies for stone in man. In the bear too it is said, these organs become horny as soon as the animal dies. The eastern peoples think that this organ in the camel makes a most reliable bowstring. There are also certain racial distinctions in connexion with it, and even varieties of ritual, the Galli, priests of the Mother of the Gods, practising amputation within the limits of injury. On the other hand in a few women there is a curious resemblance to the male organ, [clitoris?] as there is in hermaphrodites of either sex, a thing that I believe first occurred with the class of quadrupeds also in the principate of Nero: at all events Nero used to show off a team of hermaphrodite mares, that he had found in the Trier district in Gaul, harnessed to his chariot, apparently deeming it a very remarkable spectacle to see the Emperor of the World riding in a miraculous carriage.

110. The testicles in sheep and oxen hang down against the legs, but in pigs they are closely knit to the body. In the dolphin they are very long, and stowed away in the lower part of the belly, and in the elephant also they are concealed. In oviparous creatures they are attached to the loins on the inside, these animals being very rapid in copulation. Fishes and snakes have no testicles, but instead of them two passages from the kidneys to the genitals. Buzzards have three. In man only they may be crushed owing to an injury or from natural causes, and this forms a third class, in distinction from hermaphrodites and eunuchs, the impotent. In every species except leopards and bears the mares are the stronger.

111. Almost all species except man and monkeys, both the viviparous and the oviparous, have tails corresponding to the requirements of their bodies, bare with the hairy species, like boars, small with the shaggy ones, like bears, very long with the bristly, like horses. With lizards and snakes when cut off they grow again. The tails of fishes steer their winding courses after the manner of a rudder, and even serve to propel them like a sort of oar by being moved to the right and left. Actual cases of two tails are found in lizards. Oxen's tails have a very long stem, with a tuft at the end, and in asses it is longer than in horses, but it is bristly in beasts of burden. A lion's tail is shaggy at the end, as with oxen and shrew-mice, but not so with leopards; foxes and wolves have a hairy tail, as have sheep, with which it is longer. Pigs curl the tail, dogs of low breeds keep it between their legs.

CXII. Aristotle thinks that only animals with lungs and windpipe, that is those that breathe, possess a voice; and that consequently even insects make a sound, but have not a voice. the breath passing inside them and making a sound when shut up there, and that some, as bees, give out a buzz, others, as grasshoppers, a brief hiss, because the breath is received in two hollows under the chest and encountering a movable membrane inside makes a sound by rubbing against it. He thinks that flies, bees and other similar creatures begin and cease to give an audible sound when they begin and cease to fly, as the sound is caused by friction and by the air inside them, not by breathing; and that locusts make a sound by rubbing their wings against their thighs. It is indeed believed that among aquatic creatures scallops similarly make a rushing sound when they fly, but that shell-fish and crustaceans have no voice nor sound of any kind. But the other fishes, although they lack lungs and windpipe, are not entirely devoid of any sound at allpeople advance the quibble that their hiss is made with the teethand the fish in the river Achelous called the boar-fish has a grunt, and so have others about which we have spoken. Oviparous species have a hisssnakes a long one, tortoises an abrupt one. Frogs have a special kind of voice, as has been said unless in their case also we are to allow some uncertainty, because 'voice' means a sound formed in the month, not in the chest. Still in the case of frogs the nature of the localities also makes a great deal of difference: the frogs in Macedonia are reported to be dumb, and also the boars. Among birds the smaller ones are more talkative, and particularly at the mating season. Some birds, e.g. quails, give a cry when fighting, others, e.g. partridges, before a fight, others, e.g. domestic fowls, when they have won. With the latter the cocks have a crow of their own, but with other birds, for instance the nightingale class, the hens also have the same note. Some birds sing all the year, some at certain seasons, as has been said in dealing with the species separately. The elephant squeezes out a sound like a sneeze from its actual mouth, not through the nostrils, but through the nostrils it emits a harsh trumpet sound. In oxen alone the lowing of the females is louder, but in every other kind of animal the females' voice is not so loud as that of the males, even (in the case of the human race) those that have been castrated. The infant gives no sound at birth until it emerges entirely from the womb. It begins to talk when a year old; but Croesus had a son who spoke at six months and while still at the rattle stage, a portent that brought the whole of that realm to downfall. Infants that began to speak quicker are slower in starting to walk. The voice gets stronger at fourteen, but it gets weaker in old age; and it does not alter more often in any other animal.

There are other facts besides about the voice that deserve mention. It is absorbed by the sawdust or sand that is thrown down on the floor in the theatre orchestras, and similarly in a place surrounded by rough walls, and it is also deadened by empty casks. Also it runs along a straight or concave surface of wall and carries words although spoken in a low tone to the other end, if no unevenness of the surface hinders it. In a human being the voice constitutes a large part of the external personality: we recognise a man by it before we see him just in the same way as we recognise him with our eyes; and there are as many varieties of voices as there are mortals in the world, and a person's voice is as distinctive as his face. This is the source of the difference between all the races and all the languages all over the world, and of all the tunes and modulations and inflexions, but before all things of the power of expressing the thoughts that has made us different from the beasts, and has also caused another distinction between human beings themselves that is as wide as that which separates them from the lower animals.

113. When animals are born with extra limbs are useless, as is always the case when a human being is born with a sixth finger. In Egypt it was decided to rear a monstrosity, a human being with another pair of eyes at the back of the head, though he could not see with these.

114. For my own part I am surprised that Aristotle not only believed but also published his belief that our bodies contain premonitory signs of our career. But although I think this view unfounded, and not proper to be brought forward without hesitation lest everybody should anxiously seek to find these auguries in himself, nevertheless I will touch upon it because so great a master of the sciences as Aristotle has not despised it. Well then, he puts down as signs of a short life few teeth, very long fingers, a leaden complexion and an exceptional number of broken creases in the hand; and on the other side he says that those people are long-lived who have sloping shoulders, one or two long creases in the hand, more than thirty-two teeth, and large ears. Yet he does not, I imagine, note all these attributes present in one person, but separately, trifling things, as I consider them, though nevertheless commonly talked about. In a similar manner among ourselves Trogus, himself also one of the most critical authorities, has added some outward signs of character which I will append in his own words: 'When the forehead is large it indicates that the mind beneath it is sluggish; people with a small forehead have a nimble mind, those with a round

forehead an irascible mind'as if this were a visible indication of a swollen temper! 'When people's eyebrows are level this signifies that they are gentle, when they are curved at the side of the nose, that they are stern, when bent down at the temples, that they are mockers, when entirely drooping, that they are malevolent and spiteful. If people's eyes are narrow on both sides, this shows them to be malicious in character; eyes that have fleshy corners on the side of the nostrils show a mark of maliciousness; when the while part of the eyes is extensive it conveys an indication of impudence; eyes that have a habit of repeatedly closing indicate unreliability. Large ears are a sign of talkativeness and silliness,' thus far Trogus.

115. The lion's breath contains a severe poison and the bear's is pestilential: no wild animal will touch things that have come in contact with its vapour, and things that it has breathed upon go bad more quickly. Of the remaining species nature has willed that in man alone the breath shall be corrupted in a great many ways, even by bad food and bad teeth, but most of all by old age. The old man cannot feel pain, he lacks all touch and taste, without which there is no sensation at all: his breath comes and goes, constantly retiring from him, ultimately to depart from him and thereafter to be all that remains out of a human being. The breath was a draught drawn from heaven; yet for it also a penalty has been invented, so that even that which is the very means of living may not give us joy in life. This applies specially to the Parthian races, even from youth up, because of their lack of discrimination in diet, for even their mouths smell from too much wine. But their upper classes use as a remedy the seed of the citron-tree, which has a remarkably sweet aroma, adding it to their food.

The breath of elephants attracts snakes out of their holes, that of stags scorches them. We have mentioned the races of men that rid their bodies of snakes' poison by sucking it out. Moreover swine will eat snakes, and to other animals it is poison. The creatures we have designated insects can all be killed by sprinkling with oil; vultures are killed by ointment (they are attracted by the scent, which repels other birds), and beetles by a rose. A scorpion kills some snakes. In Scythia the natives poison their arrows with vipers' venom and human blood; this nefarious practice makes a wound incurableby a light touch it causes instant death.

116. We have said which animals feed on poison. Some otherwise harmless species after feeding on poisonous things become harmful themselves also. In Pamphylia and the mountain regions of Cilicia people who eat boars when these have devoured a salamander die, for there is no indication in the smell or taste; also water or wine when a salamander has died in it is fatal, and so is even drinking from a vessel out of which one has drunk; and similarly with the kind of frog called a toad! so full of traps is life! Wasps devour a snake greedily, and by so doing make their sting fatal. And so widely does diet vary that according to Theophrastus in a district where people live on fish the cattle also eat fish, but only live fish.

117. Simple food is the most serviceable for a human being an accumulation of flavours is unwholesome, and more harmful than sauces. But it is difficult completely to digest all the components contained in articles of food, all that is sharp or rough or unusual or varied, or excessive in quantity and swallowed greedily; and it is more difficult in summer than in winter, and in old age than in youth. The emetics that have been devised for digestive troubles have a chilling effect on the body, and are extremely bad for the eyes and the teeth.

To digest one's food while asleep is more conducive to corpulence than to strength, and consequently it is thought preferable for men in training to assist their digestion by taking a walk; at all events food is most thoroughly assimilated while keeping awake.

118. Sweet and fat foods and drinking add bulk, whereas dry and lean and cold foods and thirst reduce it. Some animals and also domestic cattle in Africa only drink once in three days. Starvation is not fatal to a human being after even five days; it is certain that a good many people have actually endured it more than ten days. Man is the only animal liable to the disease of a continuously insatiable appetite.

119. Again some things tasted in a very small quantity allay hunger and thirst and conserve the strength, for instance butter, mare's milk cheese, liquorice root. But anything in excess is exceedingly detrimental, even in all departments of life, but particularly to the body, and it pays better to reduce the quantity of what is in any manner burdensome.

But let us pass on to the remaining branches of Natural Science.

NATURAL HISTORY BOOK 12

1. Such are the generic and specific characteristics of all the animals about which it has been possible to obtain information. It remains to describe the things produced by the earth or dug up from itthese also not being devoid of vital spirit, since nothing lives without itand not to pass over in silence any of the works of nature.

The riches of earth's bounty were for a long time hidden, and the trees and forests were supposed to be the supreme gift bestowed by her on man. These first provided him with food, their foliage carpeted his cave and their bark served him for raiment; there are still races which practise this mode of life. This inspires us with ever greater and greater wonder that starting from these beginnings man has come to quarry the mountains for marbles, to go as far as China for raiment, and to explore the depths of the Red Sea for the pearl and the bowels of the earth for the emerald. For this purpose has been devised the fashion of making wounds in the ears, because forsooth it was not enough for jewels to be worn on the hands and neck and hair without making them even pierce through the body. Consequently it will be well to follow the biological order and to speak of trees before earth's other products, and to bring forward origins for our customs.

2. Once upon a time trees were the temples of the deities. and in conformity with primitive ritual simple country places even now dedicate a tree of exceptional height to a god; nor do we pay greater worship to images shining with gold and ivory than to the forests and to the very silences that they contain. The different kinds of trees are kept perpetually dedicated to their own divinities for instance the winter-oak to Jove, the bay to Apollo, the olive to Minerva, the myrtle to Venus, the poplar to Hercules; nay, more, we also believe that the Silvani and Fauns and various kinds of goddesses are as it were assigned to the forests from heaven and as their own special divinities. Subsequently it was the trees with juices more succulent than corn that gave mellowness to man; for from frees are obtained olive oil to refresh the limbs and draughts of wine to restore the strength, and in fine all the savours that come by the spontaneous generosity of the year, and the fruits that are even now served as a second course, in spite of the fact that battle must be waged with the wild beasts to obtain them and that fishes fattened on the corpses of shipwrecked mariners are in demand. Moreover, there are a thousand other uses for those trees which are indispensable for carrying on life. We use a tree to furrow the seas and to bring the lands nearer together, we use a tree for building houses; even the images of the deities were made from trees, before men had yet thought of paying a price for the corpses of huge animals, or arranged that inasmuch as the privilege of luxury had originated from the gods, we should behold the countenances of the deities and the legs of our tables made of the same ivory. It is stated that the Gauls, imprisoned as they were by the Alps as by a then insuperable bulwark, first found a motive for overflowing into Italy from the circumstance that a Gallic citizen from Switzerland named Helico, who had sojourned at Rome on account of his skill as an artificer, had brought with him when he came back some dried figs and grapes and some samples of oil and wine; and consequently we may pardon them for having sought to obtain these things even by means of war.

3. But who would not be justifiably surprised to hear that a tree has been procured from another clime merely for the sake of shade? This tree is the plane, which was first imported into the Ionian Sea as far as the island of San Domenico to plant over the tomb of Diomede, and which crossed from there to Sicily and was one of the first trees bestowed on Italy, and which has now travelled as far as Belgium and actually occupies soil that pays tribute to Rome, so that the tribes have to pay rent even for shade. The elder Dionysius, the tyrant of Sicily, imported plane-trees to the city of Reggio as a marvel to adorn his palace, on the site where afterwards a gymnasium was built; and it is found in the authorities that these trees were not able to grow to full size, and that in all Italy there were no thers except the 'Spania.'

4. This took place at about the period of the capture of Rome; and so much honour has since accrued to plane-trees that their growth is encouraged by having wine poured on them, as it has been found that this is of the greatest benefit to the roots, and we have taught even trees to be winebibbers!

5. Famous plane-frees are: (1) one that grew in the walks of the Academy at Athens, the roots of which were 50 feet long and spread wider than the branches; (2) at the present day there is a celebrated plane in Lycia, allied with the amenity of a cool spring; it stands by the roadside like a dwelling-house with a hollow cavity inside it 81 feet across, forming with its summit a shady grove, and shielding itself with vast branches as big as trees and covering the fields with its long shadows, and so as to complete its resemblance to a grotto, embracing inside it mossy pumice-stones in a circular rim of rocka tree so worthy to be deemed a marvel that Licinius Mucianus, who was three times consul and recently lieutenant-governor of the province, thought it worth handing down to posterity also that he had held a banquet with eighteen members of his retinue inside the tree, which itself provided couches of leafage on a bounteous scale, and that he had then gone to bed in the same tree, shielded from every breath of wind, and receiving more delight from the agreeable sound of the rain dropping through the foliage than gleaming marble, painted decorations or gilded panelling could have afforded. (3) Another instance is connected with the Emperor Caligula, who on an estate at Velletri was impressed by the flooring of a single plane-tree, and benches laid loosely on beams consisting of its branches, and held a banquet in the treehimself

constituting a considerable portion of the shadow than a dining-room large enough to hold fifteen guests and the servants: this dining-room the emperor called his 'nest.' (4) There is a single plane-free at the side of a spring at Gortyn in the island of Crete which is celebrated in records written both in Greek and Latin, as never shedding its leaves; and a typical Greek story about it has come down from early times, to the effect that underneath it Jupiter lay with Europajust as if really there were not another tree of the same species in the island of Cyprus! Slips from this tree, however, planted first in Crete itselfso eager is human nature for a noveltyreproduced the defect: for defect it was, because the plane has no greater recommendation than its property of warding off the sun in summer and admitting it in winter. During the principate of Claudius an extremely wealthy Thessalian eunuch, who was a freedman of Marcellus Aeserninus but had for the sake of obtaining power got himself enrolled among the freedmen of the emperor, imported this variety of plane-tree from Crete into Italy and introduced it at his country estate near Romeso that he deserves to be called another Dionysius! And these monstrosities from abroad still last on in Italy also, in addition, that is, to those which Italy has devised for herself.

6. For there is also the variety called the ground-plane, stunted in heightsince we have discovered the art of producing abortions even in trees, and consequently even in the tree class we shall have to speak of the unhappy subject of dwarfs. The ground-plane is produced by a method of planting and of lopping. Clipped arbours were invented within the last 80 years by a member of the Equestrian order named Gaius Matius, a friend of his late Majesty Augustus.

7. The cherry and the peach and all the trees with Greek or foreign names are also exotic; but those among them which have been naturalized here will be specified among the fruittrees. For the present we will go through the real exotics, beginning with the one most valuable for health.

The citron or Assyrian apple, called by others the Median apple, is an antidote against poisons. It has the leaves of the strawberry-tree, but with prickles running among them. For the rest, the actual fruit is not eaten, but it has an exceptionally strong scent, which belongs also to the leaves, and which penetrates garments stored with them and keeps off injurious insects. The tree itself bears fruit at all seasons, some of the apples falling while others are ripening and others just forming. Because of its great medicinal value various nations have tried to acclimatize it in their own countries, importing it in earthenware pots provided with breathing holes for the roots (and similarly, as it will be convenient to record here so that each of my points may be mentioned only once, all plants that are to travel a specially long distance are planted as tightly as possible for transport); but it has refused to grow except in Media and Persia. It is this fruit the pips of which, as we have mentioned, the Parthian grandees have cooked with their viands for the sake of sweetening their breath. And among the Medes no other tree is highly commended.

8. We have already described the wool-bearing trees of the Chinese in making mention of that race, and we have spoken of the large size of the trees in India. One of those peculiar to India, the ebony, is spoken of in glowing terms by Virgil, who states that it does not grow in any other country. Herodotus, however, prefers it to be ascribed to Ethiopia, stating that the Ethiopians used to pay as tribute to the Kings of Persia every three years a hundred logs of ebony, together with gold and ivory. Nor also should we omit the fact, since that author indicates it, that the Ethiopians used to pay twenty large elephant tusks on the same account. So high was the esteem in which ivory was held in the 310th year of our city, the date at which that author composed his history at Thurii in Italy; which makes all the more surprising the statement which we accept on his authority, that nobody of Asia or Greece had hitherto been seen who had ever seen the river Po. The exploration of the geography of Ethiopia, which as we have said had lately been reported to the Emperor Nero, showed that over a space of 1,996 miles from Syene on the frontier of the empire to Meroe trees are rare, and there are none except of the palm species. That is possibly the reason why ebony was the third most important item in the tribute paid.

9. Ebony was exhibited at Rome by Pompey the Great on the occasion of his triumph over Mithridates. According to Fabius ebony does not give out a flame, yet burns with an agreeable scent. It is of two kinds: the better one, which grows as a tree, is rareit is of a smooth substance and free from knots, and of a shiny black colour that is pleasing to the eye even in the natural state without the aid of art; whereas the other grows as a shrub like the cytisus, and is spread over the whole of India.

10. In India there is also a thorn the wood of which resembles ebony, but can be detected even by the flame of a lantern, as the light at once shines through people.

11. The tree is called the pala, and the fruit ariena. It is most frequent in the territory of the Sydraci, which was the farthest point reached by the expeditions of Alexander.

12. There is also another tree resembling this one, the fruit of which is sweeter, but causes derangement of the bowels.

Alexander issued an order in advance forbidding any member of his expedition to touch it.

13. The Macedonians have given accounts of kinds of trees that for the most part have no names. There is also one that resembles the terebinth in every other respect but the fruit of which is like an almond, though smaller, and is remarkably sweet, at all events when grown in Bactria. This tree has been considered by some persons to be a special kind of terebinth rather than another plant resembles a mulberry by its leaves, but the calyx of the fruit is like that of a dog-rose. It is grown in the plains, and no other plantations add more to the beauty of the landscape.

14. The olive-tree of India is barren, except for the fruit of the wild olive. But trees resembling our junipers that bear pepper occur everywhere, although some writers have reported that they only grow on the southern face of the Caucasus. The seeds differ from those of the juniper by being in small pods, like those which we see in the case of the kidney-bean; these pods when plucked before they open and dried in the sun produce what is called long pepper, but if left to open gradually, when ripe they disclose white pepper. which if afterwards dried in the sun changes colour and wrinkles up. Even these products, however, have their own special infirmity, and inclement weather shrivels them up and turns the seeds into barren husks, called bregma, which is an Indian word meaning 'dead.' Of all kinds of pepper this is the most pungent and the lightest, and it is pale in colour. Black pepper is more agreeable, but white pepper is of a milder flavour than either the black or the `long' pepper.

The root of the pepper-tree is not, as some people have thought, the same as the substance called ginger, or by others zinpiberi, although it has a similar flavour. Ginger is grown on farms in Arabia and Cave-dwellers' Country it is a small plant with a white root. The plant is liable to decay very quickly, in spite of its extreme pungency. Its price is six denarii a pound. It is easy to adulterate long pepper with Alexandrian mustard. Long pepper is sold at 15 denarii a pound, white pepper at 7, and black at 4. It is remarkable that the use of pepper has come so much into favour, as in the case of some commodities their sweet taste has been an attraction, and in Others their appearance, but pepper has nothing to recommend it in either fruit or berry. To think that its only pleasing quality is pungency and that we go all the way to India to get this! Who was the first person who was willing to try it on his viands, or in his greed for an appetite was not content merely to be hungry? Both pepper and ginger grow wild in their own countries and nevertheless they are bought by weight like gold or silver. Italy also now possesses a pepper-tree that grows larger than a myrtle, which it somewhat resembles. Its grains have the same pungency as that believed to belong to myrtle-pepper, but when dried it lacks the ripeness that the other has, and consequently has not the same wrinkles and colouring either. Pepper is adulterated with juniper berries, which absorb its pungency in a remarkable manner, and in the matter of weight there are several ways of adulterating it.

15. There is also in India a grain resembling that of pepper, but larger and more brittle, called the carvophyllon, which is reported to grow on the Indian lotus-tree; it is imported here for the sake of its scent. There is also a thorn-bush bearing an extremely bitter fruit that has a resemblance to pepper; this shrub has small thickly clustering leaves like the cyprus; the branches are 4 feet long, the bark of a pale colour, and the root wide-spreading and woody, of the colour of box. This root boiled in water with the seed in a copper vessel produces the medicine called lycion. The thorn in question also grows on Mount Pelion, where it is used for mixing with a drug, as also are the root of the asphodel, ox-gall, wormwood, sumach and the lees of olive oil. The best lycion for medicinal purposes is the kind that makes a froth; this is imported from India in leather bottles made of camel skin or rhinoceros hide. The shrub itself is sometimes known in Greece under the name of Chiron's buckthorn

16. Another substance imported from India is macir, the red bark of the large root of a tree of the same name, which I have been unable to identify. This bark boiled with honey is considered in medicine to be a valuable specific for dysentery.

17. Arabia also produces cane-sugar, but that grown in India is more esteemed. It is a kind of honey that collects in reeds, white like gum, and brittle to the teeth; the largest pieces are the size of a filbert. It is only employed as a medicine.

18. On the frontier of India is a race called the Arian, which has a thorn-bush that is valuable for the juice that it distils, resembling myrrh. It is difficult to get at this bush because it is hedged with thorns. In the same district there is also a poisonous bush-radish, with the leaf of a bay-tree, the smell of which attracts horses, and nearly robbed Alexander of his cavalry when he first entered the region. This also happened in Gedrosia as well, on account of the foliage of the bay-trees; and in the same district a thorn was reported the juice of which sprinkled on the eyes caused blindness in all animals. There was also a plant with a very strong scent, that was full of tiny snakes whose bite was instantly fatal. Onesicritus reports that in the valleys of Hyrcania there are trees resembling the fig, named occhustrees, which for two hours every morning drip honey.

19. Adjoining India is the Bactrian country, in which is produced the highly esteemed bdellium. The tree is black in colour, and the size of the olive; its leaf resembles that of the oak and its fruit that of the wild fig. The subsistence of the fruit is like gum; one name for it is brochos, another malacha, and another maldaeos, while a black variety which is rolled up into cakes has the name of hadrobolos. It ought to be transparent like wax, to have a scent, to exude grease when crumbled, and to have a bitter taste, though without acidity. When used in religions ritual it is steeped in wine, which makes its scent more powerful. This tree is native to Arabia and India, and also to Media and Babylon. Some people give to the bdellium imported from Media the name of peraticum; this kind is more brittle and also harder and more bitter than the others, whereas the Indian sort is moister, and gummy, Almonds are used to adulterate Indian bdellium, but all the other sorts are adulterated also with the bark of scordastum, that being the name of a tree that resembles the gum. But these adulterations can be detected and it must be enough to state this once for all, to apply to all other perfumes as wellby smell, colour, weight, taste and the action of fire. The Bactrian bdellium is shiny and dry, and has a number of white spots like fingernails; and also it has a specific weight of its own and ought not to be heavier or lighter than this. The price of pure bdellium is 3 denarii a pound.

20. Adjoining the races above mentioned is Persia. On the Red Sea, which at this point we have called the Persian Gulf, the tides of which are carried a long way inland, the trees are of a remarkable nature; for they are to be seen on the coast when the tide is out, embracing the barren sands with their naked roots like polypuses, eaten away by the salt and looking like trunks that have been washed ashore and left high and dry. Also these trees when the tide rises remain motionless although beaten by the waves; indeed at high water they are completely covered, and the evidence of the facts clearly proves that this species of tree is nourished by the brackish water. They are of marvellous size, and in appearance they resemble the strawberry-tree, but their fruit is like almonds outside and contains a spiral kernel.

21. In the same gulf is the island of Tyros, which is covered with forests in the part facing east, where it also is flooded by the sea at high tide. Each of the trees is the size of a fig-tree; they have a flower with an indescribably sweet scent and the fruit resembles a lupine, and is so prickly that no animal can touch it. On a more elevated plateau in the same island there are trees that bear wool, but in a different manner to those of the Chinese as the leaves of these trees have no growth on them, and might be thought to be vine-leaves were it not that they are smaller; but they bear gourds of the size of a quince, which when they ripen burst open and disclose balls of down from which an expensive linen for clothing is made.

22. Their name for this tree is the gossypinus; it also grows in greater abundance on the smaller island of Tyros, which is ten miles distant from the other. Juba says that this shrub has a woolly down poring round it, the fabric made from which is superior to the linen of India. He also says that there is an Arabian tree called the cynas from which cloth is made, which has foliage resembling a palm-leaf. Similarly the natives of India are provided with clothes by their own trees. But in the Tyros islands there is also another tree with a blossom like a white violet but four times as large; it has no scent, which may well surprise us in that region of the world.

23. There is also another tree which resembles this one but has more foliage and a rose-coloured blossom, which it closes at nightfall and begins to open at sunrise, unfolding it fully at noon: the natives speak of it as going to sleep. The same island also produces palm-trees and vines, as well as figs and all the other kinds of fruit-trees. None of the trees there sheds its leaves; and the island is watered by cold springs, and has a considerable rainfall.

24. The country neighbouring on these islands, Arabia, calls for some detailed account of its productsinasmuch as the parts of trees that are utilized include the root, the trunk, the bark, the juice, the gum, the wood, the shoots, the blossom, the leaves and the fruit.

25. In India a root and a leaf are held in the highest value. The root is that of the costus, which has a burning taste and an exquisite scent, though in other respects the plant is of no use. In the island of Patale just in the mouth of the river Indus, there are two kinds of costus plant, the black and the white; the latter is the better; it sells at denarii a pound.

26. About the leaf, which is that of the nard, it is proper to speak at greater length, as it holds a foremost place among perfumes. The nard is a shrub, the root of which is heavy and thick but short and black, and although oily, brittle; it has a musty smell like the gladius, and an acrid taste; the leaves are small, and grow in clusters. The shoots of the nard sprout into ears, and consequently both the spikes and the leaves of the nard are famousa twofold product. Another kind of nard growing by the Ganges is entirely ruled out by its name, putrid nard, having a poisonous smell. Nard is also

adulterated with a plant called bastard nard, which grows everywhere, and has a thicker and broader leaf and a sickly colour inclining to white; and also by being mixed with its own root to increase the weight, and with gum and silverspume or antimony and gladiolus or husk of gladiolus. Unadulterated nard can be detected by its light weight and its ruddy colour and sweet scent and particularly by its taste, which dries up the mouth and leaves a pleasant flavour.

The price of nard is 100 denarii a pound. The nard-leaf market is graded according to the size of the leaf: the kind called hadrosphaerum in larger pills costs 40 denarii; the smaller-leaved sort called mesosphaerum sells at 60 denarii; and the most highly spoken of, microsphaerum, is made of the smallest leaves and its price is 75 denarii. All the kinds have an agreeable scent, stronger when they are fresh. The better nard has a blacker colour, if it is old when gathered. In our part of the world the next most highly praised kind is the Syrian, then that from Gaul, and in the third place is the Cretan, which some call agrion and others phun; it has a leaf like that of alexanders, a stalk 18 inches long, knotted and coloured whitish purple, and a crooked hairy root resembling birds' claws. Wild nard is called valerian: we shall speak about it among flowers. All of these kinds of nard, however, are herbs except the Indian. Among them the Gallic kind is plucked 'with the root as well, and washed in wine, dried in a shady place, and done up with paper in small parcels; it does not differ much from the Indian nard, but it is lighter in weight than the Syrian. Its price is 3 denarii. In the case of these varieties the only way to test them is that the leaves must not be brittle and parched instead of merely dry. With Gallic nard there always grows the herb called little goat because of its offensive smell, like the smell of a goat; it is very much employed to adulterate nard, from which it is distinguished by having no stem and smaller leaves, and by its root, which is not bitter and also has no smell.

27. Hazelwort also has the property of nard, indeed some people actually call it 'wild nard.' It has the leaves of the ivy, only rounder and softer, a purple flower, the root of Gallic nard, and seed like grape-stones, which has a warm taste with a flavour of wine. On shady mountains it flowers twice a year. The best variety grows in Pontus, the next best in Phrygia and the third in Illyricum. When it begins to shed its leaves it is dug up and dried in the sun, as it quickly becomes mouldy and loses its strength. A plant has also lately been found in Thrace the leaves of which do not differ at all from the Indian nard.

28. The clustered arnomum is much in use; it is obtained from the Indian wild-vine, or as other people have supposed from a twisted shrub a hand high, and it is plucked with its root and then gently pressed together into bundles, as it is liable to break at once. The kind most highly spoken of is the one with leaves like those of the pomegranate and devoid of wrinkles, coloured red. The second best kind is of a pale colour; the grass-coloured one is not so good, and the white kind is the worst; it also goes white with age. The price of clustered amonum is 60 denarii a pound, but as dust it fetches only 48 denarii. It grows in the part of Armenia called Otene, and also in Media and in Pontus. It is adulterated with the leaves of the pomegranate and with liquid gum to make the leaves stick together and form a cluster like a bunch of grapes.

There is also another substance called amomis, which is not so full of veins and is harder and has less scent, showing that it is either a different plant or amomum that has been gathered unripe.

29. Resembling these substances both in name and in the shrub that produces it is cardamonum, the seeds of which are oblong in shape. It is gathered in Arabia, in the same manner as amonum. It has four varieties: one very green and oily, with sharp corners and awkward to crumblethis is the kind most highly spoken of the next sort a whitish red, the third shorter and of a colour nearer black, while an inferior kind is mottled and easily friable, and has little scentin the true kind the scent ought to be near to that of costus. Cardamonum also grows in the country of the Medes. The price of the best sort is 3 denarii a pound.

30. Next in affinity to cardamomum would have come cinnamomum, were it not convenient first to catalogue the riches of Arabia and the reasons that have given it the names of Happy and Blessed. The chief products of Arabia then are frankincense and myrrh; the latter it shares also with the Cave-dwellers' Country, but no country beside Arabia produces frankincense, and not even the whole of Arabia. About in the middle of that country are the Astramitae, a district of the Sabaei, the capital of their realm being Sabota, situated on a lofty mountain; and eight days' journey from Sabota is a frankincense-producing district belonging to the Sabaei called Sariba according to the Greeks the name means 'secret mystery.' The region faces north-east, and is surrounded by impenetrable rocks, and on the right hand side bordered by a seacoast with inaccessible cliffs. The soil is reported to be of a milky white colour with a tinge of red. The forests measure 20 schoeni in length and half that distance in breadth by the calculation of Eratosthenes a schoenus measures 40 furlongs, that is five miles, but some authorities have made the schoenus 32 furlongs. There are hills rising to a

great height, with natural forests on them running right down to the level ground. It is generally agreed that the soil is clay, and that there are few springs and these charged with alkali. Adjacent to the Astramitae is another district, the Minaei, through whose territory the transit for the export of the frankincense is along one narrow track. It was these people who originated the trade and who chiefly practise it, and from them the perfume takes the name of Minaean; none of the Arabs beside these have ever seen an incense-tree, and not even all of these, and it is said that there are not more than 3000 families who retain the right of trading in it as a hereditary property, and that consequently the members of these families are called sacred, and are not allowed to be polluted by ever meeting women or funeral processions when they are engaged in making incisions in the trees in order to obtain the frankincense, and that in this way the price of the commodity is increased owing to scruples of religion. Some persons report that the frankincense in the forests belongs to all these peoples in common, but others state that it is shared out among them in yearly turns.

31. Nor is there agreement in regard to the appearance of the incense-tree itself. We have carried on operations in Arabia, and the arms of Rome have penetrated into a large part of it; indeed, Gaius Caesar, son of Augustus, won great renown from the country; yet no Latin writer, so far as I know, has described the appearance of this tree. The descriptions given by the Greeks vary: some have stated that it has the leaf of a pear-tree, only smaller and of a grass-green colour; others that it resembles the mastich and has a reddish leaf; some that it is a kind of terebinth, and that this was the view of King Antigonus, to whom a plant was brought. King Juba in his volumes dedicated to Gaius Caesar, son of Augustus, whose imagination was fired by the fame of Arabia, states that the tree has a twisted stem and branches closely resembling those of the Pontic maple and that it gives a juice like that of the almond: he says that trees of this description are to be seen in Carmania and in Egypt, where they were introduced under the influence of the Ptolemies when they reigned there. It is well known that it has the bark of a bay tree, and some have said that the leaf is also like that of the bay: at all events that was the case with the tree when it was grown at Sardis for the Kings of Asia also interested themselves in planting it. The ambassadors who have come to Rome from Arabia in my time have made all these matters still more uncertain, which may well surprise us, seeing that even some sprigs of the incense-tree find their way to Rome, on the evidence of which we may believe that the parent tree also is smooth and tapering and that it puts out its shoots from a trunk that is free from knots.

32. It used to be the custom, when there were fewer opportunities of selling frankincense, to gather it only once a year, but at the present day trade introduces a second harvesting. The earlier and natural gathering takes place at about the rising of the Dog-star, when the summer heat is most intense. They make an incision where the bark appears to be fullest of juice and distended to its thinnest; and the bark is loosened with a blow, but not removed. From the incision a greasy foam spurts out, which coagulates and thickens, being received on a mat of palm-leaves where the nature of the ground requires this, but in other places on a space round the tree that has been rammed hard. The frankincense collected in the latter way is in a purer state, hut the former method produces a heavier weight; while the residue adhering to the tree is scraped off with an iron tool, and consequently contains fragments of bark. The forest is divided up into definite portions, and owing to the mutual honesty of the owners is free from trespassing, and though nobody keeps guard over the trees after an incision has been made, nobody steals from his neighbour. At Alexandria, on the other hand, where the frankincense is worked up for sale, good heavens! no vigilance is sufficient to guard the factories. A seal is put upon the workmen's aprons, they have to wear a mask or a net with a close mesh on their heads, and before they are allowed to leave the premises they have to take off all their clothes: so much less honesty is displayed with regard to the produce with them than as to the forests with the growers. The frankincense from the summer crop is collected in autumn; this is the purest kind, bright white in colour. The second crop is harvested in the spring, cuts having been made in the bark during the winter in preparation for it; the juice that comes out on this occasion is reddish, and not to be compared with the former taking, the name for which is carflathum, the other being called dathiathum. Also the juice produced by a sapling is believed to be whiter, but that from an older tree has more scent. Some people also think that a better kind is produced on islands, but Juba says that no incense grows on islands at all.

Frankincense that hangs suspended in a globular drop we call male frankincense, although in other connexions the term 'male' is not usually employed where there is no female; but it is said to have been due to religious scruple that the name of the other sex was not employed in this case. Some people think that male frankincense is so called from its resemblance to the testes. The frankincense most esteemed, however, is the breastshaped, formed when, while a previous drop is still hanging suspended, another one following unites with it. I find it recorded that one of these lumps used to be a whole handful. in the days when men's eagerness to pluck them was less greedy and they were allowed to form more slowly. The Greek name for frankincense formed in this manner is 'drop-incense' or 'solid incense,' and for the smaller kind 'chick-pea incense'; the fragments knocked off by striking the tree we call manna. Even at the present day, however, drops are found that weigh as much as a third of a mina, that is 28 denarii. Alexander the Great in his boyhood was heaping frankincense on the altars in lavish fashion, when his tutor Leonides told him that he might worship the gods in that manner when he had conquered the frankincense-producing races; but when Alexander had won Arabia he sent Leonides a ship with a cargo of frankincense, with a message charging him to worship the gods without any stint.

Frankincense after being collected is conveyed to Sabota on camels, one of the gates of the city being opened for its admission; the kings have made it a capital offence for camels so laden to turn aside from the high road. At Sahota a tithe estimated by measure and not by weight is taken by the priests for the god they call Sabis, and the incense is not allowed to be put on the market until this has been done; this tithe is drawn on to defray what is a public expenditure, for actually on a fixed number of days the god graciously entertains guests at a banquet. It can only be exported through the country of the Gebbanitae, and accordingly a tax is paid on it to the king of that people as well. Their capital is Thomna, which is 1487 miles distant from the town of Gaza in Judea on the Mediterranean coast; the journey is divided into 65 stages with halts for camels. Fixed portions of the frankincense are also given to the priests and the king's secretaries, but beside these the guards and their attendants and the gate-keepers and servants also have their pickings: indeed all along the route they keep on paying, at one place for water, at another for fodder, or the charges for lodging at the halts, and the various octrois; so that expenses mount up to 688 denarii per camel before the Mediterranean coast is reached; and then again payment is made to the customs officers of our empire. Consequently the price of the best frankincense is 6, of the second best 5, and the third best 3 denarii a pound. It is tested by its whiteness and stickiness, its fragility and its readiness to catch fire from a hot coal; and also it should not give to pressure of the teeth, and should rather crumble into grains. Among us it is adulterated with drops of white resin, which closely resemble it, but the fraud can be detected by the means specified.

33. Some authorities have stated that myrrh is the product of a tree growing in the same forests among the frankincensetrees, but the majority say that it grows separately; and in fact it occurs in many places in Arabia, as will appear when we deal with its varieties. A kind highly spoken of is also imported from islands, and the Sabaei even cross the sea to the Cave-dwellers' Country to procure it. Also a cultivated variety is produced which is much preferred to the wild kind. The plant enjoys being raked and having the soil round it loosened, as it is the better for having its roots cool.

34. The tree grows to a height of nearly eight feet; it has thorns on it, and the trunk is hard and twisted, and thicker than that of the frankincense-tree, and even thicker at the root than in the remaining part of it. Authorities state that the bark is smooth and resembles that of the strawberry-tree, and others that it is rough and prickly; and they say that the leaf is that of the olive, but more wrinkled and with sharp points though Juba says it is like that of the alexanders. Some say that it resembles the juniper, only that it is rougher and bristling with thorns, and that the leaf is rounder but tastes like juniper. Also there have been writers who have falsely asserted that the frankincense-tree produces myrrh as well as frankincense.

35. The myrrh-producing tree also is tapped twice a year at the same seasons as the frankincense-tree, but in its case the incisions are made all the way up from the root to those of the branches that are strong enough to bear it. But before it is tapped the tree exudes of its own accord a juice called staete. which is the most highly valued of all myrrh. Next after this comes the cultivated kind, and also the better variety of the wild kind, the one tapped in summer. No tithes are given to a god from myrrh, as it also grows in other countries; however, the growers have to pay a quarter of the yield to the king of the Gebbanitae. For the rest it is bought up all over the district from the common people and packed into leather bags; and our perfumiers have no difficulty in distinguishing the different sorts by the evidence of the scent and consistency. There are a great many varieties, the first among the wild kinds being the Cave-dweller myrrh, next the Minaean, which includes the Astramitic Gebbanitic and Ausaritic from the kingdom of the Gebbanitae: the third quality is the Dianite. the fourth a mixture from various sources, the fifth the Sambracene from a seaboard state in the kingdom of the Sabaei, and the sixth the one called Dusirite. There is also a white kind found in one place only, which is brought into the town of Mesalum for sale. The Cave-dweller kind is

distinguished by its thickness and because it is rather dry and dusty and foreign in appearance, but has a stronger scent than the other sorts. The Sambracene variety is advertised as surpassing other kinds in its agreeable quality, but it has not a strong scent. Broadly speaking, however, the proof of goodness is given by its being in small pieces of irregular shape, forming in the solidifying of the juice as it turns white and dries up, and in its showing white marks like fingernails when it is broken, and having a slightly bitter taste. The second best kind is mottled inside, and the worst is the one that is black inside; and if it is black outside as well it is of a still inferior quality.

The prices vary with the supply of buyers; that of staete ranges from 3 to 50 denarii a pound, whereas the top price for cultivated myrrh is 11 denarii and for Erythrean 16this kind is passed off as Arabianand for the kernel of Cave-dweller 16, but for the variety called scented myrrh 12. Myrrh is adulterated with lumps of lentisk and with gum, and also with cucumber juice to give it a bitter taste, as it is with litharge of silver to increase its weight. The rest of the impurities can be detected by taste, and gum by its sticking to the teeth. But the adulteration most difficult to detect is that practised in the case of Indian myrrh, which is collected in India from a certain thorn-bush; this is the only commodity imported from India that is of worse quality than that of other countriesindeed it is easily distinguished because it is so very inferior.

36. Consequently Indian myrrh passes over into mastich, which is also obtained from a thorn in India, and in Arabia as well; it is called laina. Of mastich also there are two kinds, since in Asia and Greece there is also found a plant sending out from its root leaves and a prickly head like an apple, full of seed and of juice which spurts out when an incision is made in the top, so that it can scarcely be distinguished from true mastich. Moreover, there is also a third kind in Pontus which is more like bitumen; but the kind most highly praised is the white mastich of Chios, which fetches a price of 10 denarii a pound, while the black kind costs 2 denarii. It is said that the Chian mastich exudes from the lentisk like a kind of gun. Like frankincense it is adulterated with resin.

37. Arabia also still boasts of her ladanum. A considerable number of writers have stated that this becomes aromatic entirely by accident and owing to an injury; goats, they say, an animal very destructive of foliage in general, but especially fond of scented shrubs, as if understanding the prices they fetch crop the stalks of the shoots, which swell with an extremely sweet fluid, and wipe off with the nasty shaggy hair of their beards the juice dropping from the stalks in a random mixture, and this forms lumps in the dust and is baked by the sun; and that is the reason why goats' hairs are found in ladanum; though they say that this does not take place anywhere else but in the territory of the Nabataei, a people from Arabia who border on Syria. The more recent of the authorities call this substance 'storbon,' and say that the trees in the Arabs' forests are broken by the goats when browsing, and so the juice sticks to their hairs; but that the true ladanum belongs to the island of Cyprusto mention the various kinds of scents incidentally even though not in the order of their localities of provenance. It is reported that the same thing takes place there too, and that there is a substance called oesypum which sticks to the beards and shaggy knees of the goats, but that it is produced by their nibbling down the flower of the ivy while they are browsing in the morning, when Cyprus is wet with dew; and that subsequently when the sun has driven away the mist the dust clings to their damp fleeces and thus ladanum can be combed out of them

Some people call the plant in Cyprus from which ladanum is produced 'leda,' as in fact these call the scent 'ledanum'; they say that its fat juices sweat out, and consequently the plant is rolled up in bundles by tying strings round it, and so made into cakes. Therefore there are two varieties in each kind, the natural sort mingled with earth and the artificial; the earthy sort is friable, whereas the artificial sort is tough.

It is also stated that there is a ladanum shrub in Garmania and beyond Egypt, where plants of it were introduced through the agency of the Ptolemies, or, as others say, it is a throwback from the incense-tree; and that it is collected like gum by making a cut in the bark and received in goatskin sacks. The most highly approved kind is sold at a price of 40 asses a pound. It is adulterated with myrtle berries and with filth from the fleeces of other animals beside the goat. When genuine it ought to have a fierce scent, somehow suggesting the smell of the desert, and though looking dried up it should soften immediately to the touch, and when set light to flare up with an agreeable scent; but when adulterated with myrtleberries it can be detected by its unpleasant smell, and it crackles in the fire. Moreover, the genuine ladannm has dust or r rather bits of stone from the rocks clinging to it.

38. In Arabia there is also an olive endowed with a sort of tear out of which a medicine is made, called in Greek enhaemon, because of its remarkable effect in closing the scars of wounds. These trees grow on the coast and are covered by the waves at high tide without this doing any harm to the berry, although accounts agree that salt is left on the leaves. These trees are peculiar to Arabia, and it also has a few in common with other countries, which we must mention elsewhere because in their ease it does not hold the first place. Also in Arabia there is a surprising demand for foreign scents, which are imported from abroad: so tired do mortals get of things that are their own, and so covetous are they of what belongs to other people.

39. Consequently they send to the Elymaei for the wood of the bratum, a tree resembling a spreading cypress, with very white branches, and giving an agreeable scent when burnt. It is praised in the Histories of Claudius Caesar as having a marvellous property: he states that the Parthians sprinkle its leaves into their drinks, and that it has a scent very like cedar, and its smoke is an antidote against the effects of other woods. It grows beyond the River Karun on Mount Scanchrus in the territory of the city of Sostrata.

40. They also import from Carmania the stobrus tree, to use for the purpose of fumigation; it is soaked in palm wine and then set alight. The vapour is thrown back from the ceiling to the floor; it has an agreeable scent, but it causes headache, which is not however severe enough to be painful: it is used as a soporific for invalids. For these trades they have opened up the city of Carrhac, which is the market town of these parts. From Carrhac everybody used formerly to go on to Gabba, a journey of twenty days, and to Palestine in Syria; but afterwards, according to Juba, they began to make for Charax and the Parthian kingdom for the sake of the perfume trade. But my own view is that they used to convey those commodities to the Persians even before they took them to Syria or Egypt, this being attested by Herodotus, who records that the Arabs used regularly to pay a yearly tribute of a thousand talents of incense to the kings of the Persians. From Syria they bring back styrax, which they burn on their hearths, for its powerful scent to dispel their dislike for their own scents. For the rest, no other kinds of wood are in use among them except those that are scented; and the Sabaei even cook their food with incense-wood, and other tribes with that of the myrrh-tree, so that the smoke and vapour of their towns and districts is just like that which rises from altars. In order therefore to remedy this smell they obtain styrax in goatskins and fumigate their houses with it: so true it is that there is no pleasure the continued enjoyment of which does not engender disgust. They also burn styrax to drive away the snakes which abound in the forests of perfume-producing trees.

41. These people have not got cinnamon or casia, and nevertheless Arabia is styled 'Happy'a country with a false and ungrateful appellation, as she puts her happiness to the credit of the powers above, although she owes more of it to the power below. Her good fortune has been caused by the luxury of mankind even in the hour of death, when they burn over the departed the products which they had originally understood to have been created for the gods. Good authorities declare that Arabia does not produce so large a quantity of perfume in a year's output as was burned by the Emperor Nero in a day at the obsequies of his consort Poppaea. Then reckon up the vast number of funerals celebrated yearly throughout the entire world, and the perfumes such as are given to the gods a grain at a time, that are piled up in heaps to the honour of dead bodies. Yet the gods used not to regard with less favour the worshippers who petitioned them with salted spelt, but rather, as the facts show, they were more benevolent in those days. But the title 'happy belongs still more to the Arabian Sea, for from it come the pearls which that country sends us. And by the lowest reckoning India, China and the Arabian peninsula take from our empire 100 million sesterces every yearthat is the sum which our luxuries and our women cost us: for what fraction of these imports, I ask you, now goes to the gods or to the powers of the lower world?

42. In regard to cinnamomum and casia a fabulous story has been related by antiquity, and first of all by Herodotus, that they are obtained from birds' nests, and particularly from that of the phoenix, in the region where Father Liber was brought up, and that they are knocked down from inaccessible rocks and trees by the weight of the flesh brought there by the birds themselves, or by means of arrows loaded with lead; and similarly there is a tale of casia growing round marshes under the protection of a terrible kind of bats that guard it with their claws, and of winged serpentsthese tales having been invented by the natives to raise the price of their commodities. However, there goes with them a story that under the reflected rays of the sun at midday an indescribable sort of collective odour is given off from the whole of the peninsula, which is due to the harmoniously blended exhalation of so many kinds of vapour, and that the first news of Arabia received by the fleets of Alexander the Great was carried by these odours far out to seaall these stories being false, inasmuch as cinnamomum, which is the same thing as cinnamon, grows in Ethiopia, which is linked by intermarriage with the Cave-dwellers. The latter buy it from their neighbours and convey it over the wide seas in ships that are neither steered by rudders nor propelled by oars or drawn by sails, nor assisted by any device of art: in those regions only man and man's boldness stands in place of all these things.

Copyright © 2018 by Lord Henfield, Guildford Scientific Press PAGE 3499 Moreover they choose the winter sea about the time of the shortest day, as an east wind is then chiefly blowing. This carries them on a straight course through the bays, and after rounding a cape a west-north-west wind brings them to the harbour of the Gebbanitae called Ocilia. On this account that is the port most resorted to by these people, and they say that it is almost five years before the traders return home and that many perish on the voyage. In return for their wares they bring back articles of glass and copper, clothing, and buckles, bracelets and necklaces; consequently that traffic depends principally on having the confidence of the women.

The actual shrub of the cinnamon is only about three feet high at the most, the smallest being only a span high, and four inches thick, and it throws out shoots as low as six inches from the ground; it has a dried up appearance, and while it is green has no scent; the leaf is like that of the wild marjoram; it likes a dry soil and is less fertile in wet weather; and it stands constant clipping. Though it grows on level ground, it flourishes among the thickest bushes and brambles, and is difficult to gather. It can only be cut 'with the leave of the god'which some understand to mean Jove, but the Ethiopian name for him is Assabinus. They sacrifice 44 oxen, goats and rams to obtain leave to cut it, though this does not include permission to do so before sunrise or after sunset. A priest divides the twigs with a spear, and sets aside a portion for the god, while the rest is packed up in clumps by the dealer. Another account is also given, that a share is assigned to the sun, and that the wood is divided into three portions, and then lots are cast twice to assign the shares, and the share that falls to the sun is left, and bursts out in flames of its own accord

The finest quality with cinnamon belongs to the thinnest parts of the boughs, for about a span's length; the second best to the next pieces for a shorter length, and so on in order; the worst in quality is the part nearest to the roots, because it has the least amount of bark, which is the part most favoured, and consequently preference is given to the tops of the plants, where there is most bark. The actual wood, however, is held in no esteem, because it has the bitter taste of wild marjoram: it is called wood-cinnamon; it fetches 10 denarii a pound. Some writers mention two kinds of cinnamon, one lighter and the other darker in colour; and in former days the light kind was preferred, but now on the other hand the dark is praised, and even a mottled kind is preferred to the pure white. Still, the most certain test of value is that it must not be rough, and that when rubbed together it must crumble slowly. The lowest value is attached to it when it is soft or when the bark is falling of.

The right of controlling the sale of cinnamon is vested solely in the king of the Gebbanitae, who opens the market by public proclamation. The prices formerly were 1000 denarii a pound, but this was raised to half as much again after the forests had been burnt, so it is said, by infuriated barbarians; but it is not absolutely certain whether this was incendiarism provoked by injustice on the part of those in power or was due to accident, as we find it stated in the authorities that the south winds that blow there are so hot that they set lire to the forests in summer. His Majesty the emperor Vespasian was the first person to dedicate in the Temples of the Capitol and of Peace chaplets of cinnamon surrounded with embossed gold. We once saw in the Temple of the Palatine erected in honour of his late Majesty Augustus by his consort Augusta a very heavy cinnamon-root placed in a golden bowl, out of which drops used to distil every year which hardened into grains; this went on until the shrine in question was destroyed by fire.

43. Casia also is a shrub, and it grows close to the plains of cinnamon, but on the mountains: it has thicker stalks, and a thin skin rather than bark, which, in the opposite way to what we said in the case of cinnamon gains value when it falls off and thins away. This shrub grows to a height of 4 feet and it has three colours: when it first sprouts up, to the length of a foot it is white, then for the next six inches it is reddish, and beyond that point it is black. The black part is most highly esteemed, and next the part nearest to it, but the white part has no value at all. They cut the shoots to the length of two inches, and then sew them up in newly flayed hides of animals slaughtered for the purpose, so that as they rot maggots may gnaw away the wood and hollow out the whole of the bark, which is protected from them by its bitter taste. The bark is valued most highly when fresh, when it has a very pleasant smell and is hardly at all hot to the taste, and rather gives a slight nip with its moderate warmth; it must be of a purple colour, and though bulky weigh very little, and the pores of the outer coats should be short and not liable to break. This kind of casia is called by a foreign name, lada. Another kind is near-balsam, so called because it has a scent like that of balsam, but it has a bitter taste and consequently is more useful for medicinal purposes, just as the black kind is more employed for unguents. No substance has a wider range of pricethe best qualities sell at 50 denarii a pound and the others at 5. To these varieties the dealers have added one which they call Daphnis's casia, with the further designation of near-cinnamon, and they price it at 300 denarii. It is adulterated with styrax, and with very small sprigs of bay

THE GRAND BIBLE

because of the similarity of the barks. It is also grown in our part of the world, and I have seen it on the extreme edge of our empire, where the Rhine washes our frontier, planted among beehives; but there it has not the scorched colour produced by the sun, and for the same reason also it has not the same scent as the southern product.

44. From the border of the casia and cinnamon district gum-resin and aloe-wood are also imported, but they come by way of the Nabataean Cave-dwellers, who are a colony from the Nabataei.

45. The same place is also a centre for the collection of serichatum and gabalium, the supply of which is used up by the Arabs in their own country, so that they are only known by name to our part of the world, although growing in the same country as cinnamon and casia. However, serichatum does occasionally get through to us, and is employed by some persons as an ingredient in unguents. It fetches up to 6 denarii a pound.

46. The Cave-dweller country and the Thebaid and Arabia where it separates Judea from Egypt all alike have the myrobalanum, which is grown for scent, as is shown by its name itself, which also indicates in addition that it is a nut; it is a tree with a leaf that resembles that of the heliotrope, which we shall describe among the herbaceous plants, and a fruit the size of a hazel-nut. The variety growing in Arabia is called the Syrian nut, and is white in colour, whereas the Thebaid kind is black; the former is preferred for the excellent quality of the oil extracted from it, but the Thebaic for its large yield. The Cave-dweller kind is the worst among the varieties. Some persons prefer to these the Ethiopian behen, which has a black oily nut and a slender kernel, but the liquid squeezed out of it has a stronger scent; it grows in level districts. It is said that the Egyptian nut is even more oleaginons and has a thicker shell of a reddish colour, and that though it grows on marshy ground the plant is shorter and drier, whereas the Arabian variety, on the contrary, is green in colour and also smaller in size and more compact in shape because it likes mountain regions; but the Petraean kind, coming from the town mentioned above, is a long way the bestit has a black rind and a white kernel. Perfumiers, however, only extract the juice from the shells, but medical men also crush the kernels, gradually pouring warm water on them while pounding them.

47. The palm-tree growing in Egypt called the adipsos is used in a similar way to the behen-nut in perfumery, and is almost as much in request; it is green in colour, with the scent of a quince, and has no kernel inside it. It is gathered in autumn, a little before it begins to ripen. If left on the tree longer, it is called the palm-nut, and it turns black and has the property of making people who eat it intoxicated. The behen-nut is priced at two denarii a pound. The retailers also give the name of behen to the dregs of the unguent made from it

48. The scented reed which also grows in Arabia is shared with the Indies and Syria, the one growing in the latter country being superior to all the other kinds. About 17 miles from the Mediterranean, between Mount Lebanon and another range of no importancenot Counter-Lebanon as some have supposed there is a moderately wide valley near a lake the shallow parts of which dry up in summer, where 3 miles from the lake the scented reed and scented rush grow. For clearly we may speak about the rush also, although I have devoted another volume to herbaceous plants, as here we are only dealing with plants that supply material for unguents. These plants then do not differ at all in appearance from the rest of their class, but the reed has a specially fine scent which attracts people even from a long way off, and is softer to the touch; the better variety is the one that is less brittle and that breaks in splinters rather than like a radish. Inside the tube there is a sort of cobweb which is called the flower; the plant containing most of this is the best. The remaining tests of its goodness are that it should be blackwhite varieties are thought inferiorthat it is better the shorter and thicker it is and if it is pliant in breaking. The price of the reed is one denarius and that of the rush 5 denarii a pound. It is reported that scented rush is also found in Campania.

We have now left the countries looking on the ocean to come to those that converge towards our seas.

49. Well, Africa, which lies below Ethiopia, in its sandy deserts distils tear-like drops of a substance called hammoniacum; this is also the origin of the name of the Oracle of Hammon, near to which this substance is produced from a tree called metopon, after the manner of resin or gum. There are two kinds of hammoniacum: one called thrauston (friable), which is like male frankincense and is the kind most approved, and the other, greasy and resinous, which they call phyrama (paste). It is adulterated with sand, which looks as if it has stuck to it while growing; consequently it is preferred in extremely small lumps and these as pure as possible. The price of the best hammoniacum is 40 asses a pound.

50. The sphagnos valued most highly is found in the province of Cyrenaica, south of these regions: others call it bryon. The second place is held by the Cyprian kind, and the third by the Phoenician. It is also said to grow in Egypt, and

indeed in Gaul as well, and I am not prepared to doubt this; for there are grey tufts that bear this name growing on trees, resembling the growths that we principally see on the oak, but having a superior scent. The most highly esteemed are the whitest and most widely spreading mosses, and the bright red ones are in the second class, but no value at all is attached to the black variety; moreover, the mosses that grow on islands and on rocks are not esteemed, nor are all those that have the scent of palm-trees and not that of their own kind.

51. A tree found in Egypt is the cypros, which has the leaves of the jujube-tree and the white, scented seed of the coriander. Cypros-seed is boiled in olive oil and afterwards crushed, producing the cypros of commerce, which sells at 5 denarii a pound. The best is made from the tree grown at Canopus on the banks of the Nile, the second best at Ascalon in Judea, and the third quality on the island of Cyprus, which has a sort of sweet scent. The cypros is said to be the same as the thorn called privet in Italy.

52. În the same region grows the aspalathus, a white thorn of the size of a moderate-sized tree, with the flower of a rose; the root is in request for unguents. People say that any shrub over which a rainbow forms its arch gives out a scent as sweet as that of the aspalathus, but that if this happens in the case of an aspalathus a scent rises that is indescribably sweet. Some call this shrub red sceptre and others sceptre. The test of its genuineness lies in its fiery red colour, firmness to the touch and scent like that of beaver-oil. It is sold for 5 denarii a pound.

53. Cat-thyme also grows in Egypt, though not so good a kind as the Lydian variety, its leaves being larger and variegated; those of the Lydian are short and very small, and have a strong scent.

54. But every other scent ranks below balsam. The only country to which this plant has been vouchsafed is Judea. where formerly it grew in only two gardens, both belonging to the king; one of them was of not more than twenty ingera in extent and the other less. This variety of shrub was exhibited to the capital by the emperors Vespasian and Titus; and it is a remarkable fact that ever since the time of Pompey the Great even trees have figured among the captives in our triumphal processions. The balsam-tree is now a subject of Rome, and pays tribute together with the race to which it belongs; it differs entirely in character from the accounts that had been given of it by Roman and foreign writers, being more like a vine than a myrtle: it has quite recently been taught to grow from mallet-shoots tied up on trellises like a vine, and it covers whole hillsides as vineyards do. A balsam unsupported by a trellis and carrying its own weight is pruned in a similar manner when it puts oat shoots: the use of the rake makes it thrive and sprout rapidly, bearing in its third year. Its leaf is very near that of the tuber-apple, and it is an evergreen. The Jews vented their wrath upon this plant as they also did upon their own lives, but the Romans protected it against them, and there have been pitched battles in defence of a shrub. It is now cultivated by the treasury authorities, and was never before more plentiful; but its height has not advanced beyond three feet.

There are three varieties of balsam-tree: one with thin foliage like hair, called easy-to-gather; another with a rugged appearance, curving over, of a bushy growth and with a stronger scent they call this rough balsam, and the third tall balsam because it grows higher than the rest; this has a smooth bark. This last is the second best in quality, and the easy-to-gather kind is the lowest grade. Balsam-seed tastes very like wine, and has a red colour and a rather greasy consistency; that contained in a husk, which is lighter in weight and greener in colour, is inferior. The branch is thicker than of that of a myrtle; incision is made in it with a piece of glass or a stone, or with knives made of bone it strongly dislikes having its vital parts wounded with steel, and dies off at once, though it can stand having superfluous branches pruned with a steel knife. The hand of the operator making the incision has to be poised under skilful control, to avoid inflicting a wound going below the bark. The juice that oozes out of the incision is called opobalsamum; it is extremely sweet in taste, but exudes in tiny drops, the trickle being collected by means of tufts of wool in small horns and poured out of them into a new earthenware vessel to store; it is like rather thick olive-oil and in the unfermented state is white in colour; later on it turns red and at the same time hardens, having previously been transparent. When Alexander the Great was campaigning in that country, it was considered a fair whole day's work in summer to fill a single shell, and for the entire produce of a rather large garden to be six congii and of a smaller one congius, at a time moreover when its price was twice its weight in silver: whereas at the present day even a single tree produces a larger flow. The incision is made three times in every summer, and afterwards the tree is lopped. There is a market even for the twigs too: within five years of the conquest of Judea the actual loppings and the shoots fetched 800,000 sesterces. These trimmings are called wood of balsam; they are boiled down in perfumes, and in manufacture they have taken the place of the actual juice of the shrub. Even the bark fetches a price for drugs; but the

tears are valued most, the seed coming second, the bark third and the wood lowest. Of the wood the sort resembling boxwood is the best, and also has the strongest scent; the best seed is that which is largest in size and heaviest in weight, which has a biting taste and is hot in the mouth. Balsam is adulterated with the ground-pine of Petra, which can be detected by its size, hollowness and long shape and by its weak scent and its taste like pepper. The test of tear of balsam is that it should be thinning out in consistency, and slightly reddish, and give a strong scent when rubbed. The second quality is white in colour, the next inferior is green and thick, and the worst kind black, inasmuch as like olive oil it deteriorates with age. Out of all the incisions the oil that has flowed out before the formation of the seed is considered the best. Also another mode of adulteration is by using the juice of the seed, and the fraud can be with difficulty detected by the greater bitterness of the taste; for the proper taste is smooth, without a trace of acidity, the only pungency being in the smell. It is also adulterated with oil of roses, of cyprus, of mastich, of behen-nut, of the turpentine-tree and of myrtle, and with resin, galbanum and wax of Cyprus, just as occasion serves: but the worst adulteration is with gum, since this dries up on the back of the hand and sinks in water, which is a double test of the genuine article pure tear of balsam ought to dry up likewise, but the sort with gum added to it turns brittle and forms a skin. It can also be detected by the taste; or when adulterated with wax or resin, by means of a hot coal, as it bums with a blacker flame. When mixed with honey, its quality alters immediately, as it attracts flies even when held in the hand. Moreover a drop of pure balsam thickens in warm water, settling to the bottom of the vessel, whereas when adulterated it floats on the top like oil, and if it has been tampered with by using almond-oil, a white ring forms round it. The best test of all is that it will cause milk to curdle and will not leave stains on cloth. In no other case is more obvious fraud practised, inasmuch as every pint bought at a sale of, confiscated property for 300 denarii when it is sold again makes 1000 denarii: so much does it pay to increase the quantity by adulteration. The price of wood-balsam is six denarii a pound.

55. The region of Syria beyond Phoenicia nearest to Judea produces styrax in the part round Gabala and Marathus and Mount Casius in Seleucia. The tree has the same name; it is similar to a quince. Its tears have a pleasant, almost pungent scent, and inside it resembles a reed, and is full of juice. About the rising of the Dog-star certain little maggots with wings flutter about this tree, gnawing away the wood, and consequently it is fouled with their scrapings. The styrax esteemed next to the above-named growths comes from Pisidia. Side, Cyprus and Cilicia, and that from Crete is rated lowest; that from Mount Amanus in Syria is valued by the medical profession, but even more by perfumiers. In every nation a red colour and a sticky consistency are preferred, and styrax that is brown and covered with white mould is considered inferior. It is adulterated with cedar resin or gum, and another way employs honey or bitter almonds; all these adulterations can be detected by their taste. The price of the best styrax is 17 denarii. It is also produced in Pamphylia, but this is a drier and less juicy kind.

56. Syria also supplies galbanum, which also grows on Mount Amanus; it comes from a kind of fennel which they call stagonitis, like the resin of the same name. The kind of galbanum most esteemed is cartilaginous, clear like hammonia-cuxa and free from all woody substance. Even so it is adulterated with beans or with sacopenium. Pure galbanum, if burnt, drives away snakes with its smell. It is sold at 5 denarii a pound.

57. Pure galbanum is only useful for medicinal purposes; but Syria produces all-heal which is used for guents as well. It also grows at Psophis in Arcadia and round the spring of Erymanthus, and in Africa and in Macedonia also. It has a peculiar stalk 7 feet long; this throws out first four leaves and then six lying on the ground, which are very large and of a round shape, but the leaves on the top of the plant are like those of the olive; the seed hangs in tufts like that of the fennel. The juice is got by means of incisions made in the stalk at harvest time and at the root in autumn. It is valued for whiteness when it coagulates, the next grade being assigned to juice of a pale colour, while the black is held of no value. The price of the best quality is two denarii a pound.

58. From this fennel the one called bear's-wort fennel differs only in the leaf, which is smaller, and has divisions like a plane-leaf. It only grows in shady places. Its seed, bearing the same name, resembles that of hart-wort; it is only useful for medicine.

59. Syria also supplies the malobathrum, a tree with a folded leaf, the colour of a leaf that has dried up; from it oil is pressed to use for unguents, Egypt also producing it in still greater quantity. But the kind that comes from India is valued more highly; it is said to grow there in marshes, like the lentil, with a scent stronger than that of saffron, a darkish rough appearance, and a sort of salt taste. The white variety is less highly spoken of; it very quickly acquires a musty smell with age. Malobathrurn when placed under the tongue ought to
